1933

# PREFACE

THE varying aspects of a trying year will be found summarized in THE NEW INTERNATIONAL YEAR BOOK for 1932 which, although it is issued under different editorial supervision, is based on the same policy and follows the same plans as preceding volumes. The same able collaboration has been secured, and the services of Experts and Specialists of high standing in their profession, who have contributed to these pages, are ample guarantee of the excellence and reliability of the contents of the present work.

The new volume is the 31st in the Series. Practically, it constitutes a record of the eventful year 1932 and contains an unusual wealth of material of great value to the reading and writing public, and to the educational world at large. Librarians will find the volume a succinct guide to the history of the year.

Outstanding achievements in all fields of human activity, from the Science of ARCHITECTURE to that of ZOOLOGY, are passed in review, and a colorful panoramic picture of the events of the year is presented in the pages that follow. The individuality of collaborators has been preserved by allowing each contributor to state the facts affecting his particular branch of learning, domain of science, or field of art and letters, not only in his own language but also in his own way, and so the work of the expert is inseparably associated with that of the scholar. The language of sport and of the open spaces, picturesque and pointed in racy character, appears side by side with the more formal and precise expression of the scholar and scientist.

Being due to the relations of cause to effect, the positions of the civilized nations of the world to-day are the result of a chain of events which, although apparently not connected with any one thing, are actually connected in common with many things. One event follows on another with such rapidity as to speedily crowd the first out of sight, but not before it has revealed its part in a well-plotted, colorful panorama in which the great poet's every "unforgiving minute" is filled "with sixty seconds worth of distance run."

In the field of INTERNATIONAL RELATIONS and POLITICS the following developments were of special interest in 1932:

1. *The Manchurian situation.* The establishment of Manchoukuo, the Lytton Report, the proclamation of the Stimson Doctrine, the estrangement of Japan from the League of Nations. Also the warfare at Shanghai in China proper.

2. *Reparations and War Debts.* The Lausanne Conference which ended the Young Plan and made a definitive settlement of the reparation problem. The negotiations between the United States and European countries over war debts, ending in the default of France, Belgium, Poland, Greece, and Estonia.

3. *The return to power in Germany of the Conservative Landowning and Military Classes.* The reelection of Hindenburg, the German success in virtually ending the reparation and disarmament clauses of the Versailles Treaty and the development of the movement for revision of the territorial clauses, with Italian support.

4. *The French General Elections.* The success of the Left parties, followed by the establishment of the Herriot cabinet and a reorientation of French foreign policy in which the conclusion of the Franco-British Accord at Lausanne and the non-aggression pact with the Soviet Union served as a counterweight to the development of the Hitler movement in Germany.

5. *The Ottawa Conference.* The permanent abandonment of free trade by Great Britain and the establishment of a protective tariff with preferential rates for Empire products.

6. *The Geneva Disarmament Conference.* The Hoover Plan for a one-third reduction in armaments.

7. *War between Bolivia and Paraguay in the Chaco.* Efforts of the Inter-American Conciliation Commission and the League of Nations to end the dispute, the application of the Stimson Doctrine to the dispute.

8. *Latin American Developments.* Civil War in Brazil. Reestablishment of constitutional government in Argentina with the inauguration of President Justo. Revolutions in Chile, followed by the election and inauguration of President Arturo Alessandri. The replacement of President Ortiz Rubio by Gen. Abelardo Rodriguez in Mexico. In Nicaragua, Dr. Juan Bautista Sacasa was elected President in succession to Gen. José María Montecada at an election supervised by the United States, after which evacuation of the American marines commenced. Resort to terrorism and assassination by both the government and its opponents in Cuba. Revolutions in Honduras, Salvador, Ecuador, and Peru. Rejection by the Haitian Congress of a treaty providing for gradual termination of United States control.

9. *Further progress toward Autonomy for India at a Third Round-Table Conference.*

10. *United States Congress passed a bill granting freedom to the Philippines in about 12 years.*

11. *Iraq established as an independent state and member of the League of Nations.*

12. *Renewal of the food shortage in the Soviet Union as a result of passive resistance of the peasants on the collective farms. Completion of the Dniaper hydro-electric project and of other great industrial plants. Completion of the Soviet Five-Year Plan in four and a quarter years. New dissension in the Russian Communist party.*

13. *The Fascist movement in Japan. Assassination of Premier Inukai. Formation of the Saito Cabinet.*

14. *Victory of Eamon de Valera in the Irish Free State. His steps to abolish the oath of allegiance and the land annuities. Tariff war with Great Britain.*

15. *The Spanish Republican Government reorganized the political, economic, and social life of the nation.*

The record of Time, punctuated as it is with the occurrence of events, provides us with a text to which the mind may turn for information. With the help of BIOGRAPHY and CHRONOLOGY, every year paints this record which forms its own picture, and notwithstanding the fact that we are taught that there is no new thing under the sun, no two pictures are alike. Years never agree with years, nor days with days, for Time rings its own changes and brings variations that serve to chasten us for what we have done, or to hearten us for that which we have yet to do.

Years, the fingers of Time, mold the period in which we live and mellow our remembrances of it when it is passed, and Time, having written *Fins*, on the events of the year 1932, all that remains for man to do is to place on record their occurrence and their effect on the world at large, setting naught down in malice but with charity to all. A multitude of events—good, bad, or indifferent—now crowd pages that once were fair and white. Blots there are that happily are counterbalanced by blessings by the score, for Time, the father of mutability, is man's master in health as in sickness, and in joy as in sorrow, for he dulls the keen edge of grief and brings consolation to the afflicted. So it comes about that man experiences great relief as the years roll on and carry with them memories of heavy burdens borne, pain suffered, and exactions endured.

## PREFACE

Within the 856 pages of the present Volume the Editors and Contributors have treated 3,138 subjects, correlated by references and cross-references, topical divisions, and subdivisions, which present as a perfect whole more than 50,000 facts—the one literary tool indispensable to the home, the office, the classroom, the study, and the library shelf and reference room. THE NEW INTERNATIONAL YEAR BOOK for 1932 will be found to contain a greater mass of valuable material than has been collected and brought together in any other volume.

As life is lived through simple deeds and great, and actions are better than words, the outstanding achievements of statesmanship in National and International politics help to build the arch with which we are enabled to bridge over the abysmal problems that confront us. At home, as much as abroad, friendly relations with our neighbors are maintained as much through the cordial intercourse of individual friends as by the exercise of the refinements of statecraft, but POLITICS being an inherent part of the fabric of nations, must have its day, and our record would be incomplete without it, so political activities find a place in our book of life. Therein the outstanding event of national and international importance was the PRESIDENTIAL ELECTION, the trend or general course of which had been foreshadowed earlier in the year by two polls remarkable for their accuracy in that they showed conclusively how coming events cast their shadows before—these were *The Literary Digest* PRESIDENTIAL and PROHIBITION POLLS.

Those persons who are of retrospective mind will find in the BUSINESS REVIEW as complete a picture of commercial conditions during 1932 as can be presented. The lover of SPORTS can turn to the OLYMPIC GAMES—the greatest sporting feature of the year—and refresh his memory with the story of the struggle of the Champions for World Supremacy in the various events that constituted the Tenth Olympiad.

Throughout the year RACKETEERING was rampant and its handmaiden CRIME accompanied it through the Courts of LAW where tragedies of common and uncommon occurrence were exposed to the cold calm eye of the Judiciary and punishment to fit the crime meted out to the offender.

The advances in SCIENCE will be found discussed under their respective heads, and, mindful of the great value of the work done in CHEMICAL SCIENCE by DR. MARCUS BENJAMIN of the Smithsonian Institution, U. S. National Museum, Washington, D. C., who for more than twenty years contributed the articles on CHEMISTRY to THE NEW INTERNATIONAL YEAR BOOK, it is my sorrowful duty to record his death—a death in which the Readers of this work must suffer the loss of an eminent scholar and scientist—a man of international reputation in the world of letters, beloved far and wide and who, even in the closing hours of his life, sacrificed himself to duty, for he completed the able contribution that appears in this volume only a few hours before God touched his eyes and he slept. Another equally regrettable loss to the Staff of Contributors occurred in the death of MRS. AMELIA VON ENDE who for many years had contributed the article on GERMAN LITERATURE to the NEW INTERNATIONAL YEAR BOOK.

In the world of ART the Publishers were fortunate in securing the valued services of MISS LEILA MEHLIN who has contributed a brilliant analytic survey of ART during the year 1932 to these pages. MR. GEORGE N. SHUSTER kindly undertook the preparation of the article on GERMAN LITERATURE.

Outstanding achievements in aeronautics and aviation, in art and literature, in drama and the motion picture world, in opera, and in radio are recorded in their respective places.

The world of National and International Finance is fully represented and its activities during the year expounded clearly for a better understanding of the most perplexing problems of modern life—the balancing of budgets and the balance of trade.

The matter of public relief, for which the vast sum of \$80,000,000 was raised and spent in 1932, to help nearly a million persons whose need was directly attributed to unemployment, is comprehensively treated under subjects allied to ECONOMIC, SOCIAL, AND POLITICAL SCIENCE.

Mindful of the fact that the prosperity of those who till the soil is the basis of the prosperity of the world at large, the plight of the farmers, during the year, not merely in the United States but in every country where the masses follow agricultural pursuits, has been shown in special articles on AGRICULTURE, AGRICULTURAL EXPERIMENT STATIONS, and AGRICULTURAL EXTENSION WORK, and is reflected in the statistics of production under each respective country. The year 1932 was a year of severe strain for all farmers which is better understood by comparing the agricultural income for 1929 with that of 1932—\$11,900,000,000 with \$5,200,000,000.

Notwithstanding conditions that it could not control that seriously affected other branches of knowledge, SCIENCE swept onward to new victories in 1932. CHADWICK, COMPTON, MILLIKAN, and PICCARDI, COCKROFT, WALTON, BOTHE, and the JOLIOTS, added not merely to the vocabulary that we use but to the knowledge we had of atoms, electrons, neutrons, protons, cosmic rays, hormones, and vitamins.

Appreciative thanks for obligations incurred and courtesies received are offered to the Officers of the various Departments of the United States Government and their allied Bureaus; also, to the Officers of those other Governments who have supplied much information concerning their respective countries; to the Committee of "A Century of Progress" Exposition, Chicago; to MR. WILLIAM P. BANNING, of the American Telephone and Telegraph Company; to *Bradstreets*, and to each and every Association, Company, Corporation, or other Institution that has contributed material which will serve to maintain the high degree of accuracy required of this work.

To the EDITORS associated with him in this work, to the CONTRIBUTORS, and to the Assistant to the Editor, MISS HELEN READY BIRD, the undersigned owes much and tenders his grateful thanks for hearty cooperation and able service.

EDITOR  
FRANK H. VIZETELLY, LITT.D., LL.D.

ASSOCIATE EDITORS AND CONTRIBUTORS

**AERONAUTICS; CELEBRATIONS; MINERALS; TECHNOCRACY**  
CHARLES EARLE FUNK, C.E.,  
ASSOCIATE EDITOR.

**AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; COTTON; TOBACCO**  
HENRY M. STEECE, B.S. (Agr.), A.M.,  
SPECIALIST IN AGRONOMY, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**AGRICULTURAL EXTENSION WORK**  
REUBEN BRIGHAM, B.S. (Agr.),  
SENIOR AGRICULTURALIST, IN CHARGE OF VISUAL INSTRUCTION AND EDITORIAL WORK, OFFICE OF COÖPERATIVE EXTENSION WORK, EXTENSION SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE.

**ANTHROPOLOGY (WITH ETHNOLOGY)**  
LESLIE SPIER, PH.D.,  
RESEARCH ASSOCIATE IN ANTHROPOLOGY, YALE UNIVERSITY.

**ARCHÆOLOGY**  
OLIVER SAMUEL TONKS, PH.D.,  
PROFESSOR OF ART, VASSAR COLLEGE

**ARCHITECTURE**  
TALBOT F. HAMLIN,  
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS

**ASTRONOMY; METEOROLOGY; FLOODS; SEISMOLOGY**  
EDGAR W. WOOLARD, PH.D.,  
DEPARTMENT OF MATHEMATICS, GEORGE WASHINGTON UNIVERSITY.

**AUTOMOBILES**  
HENRY R. COBLEIGH, M.E.,  
MEMBER OF STAFF, NATIONAL AUTOMOBILE CHAMBER OF COMMERCE.

**BIOGRAPHY**  
MARY CLAPP,  
ASSOCIATE EDITOR.

**CHEMISTRY**  
MARCUS BENJAMIN, PH.D., Sc.D., LL.D.  
LATE EDITOR FOR THE UNITED STATES NATIONAL MUSEUM.

**CIVIL ENGINEERING**  
JAMES K. FINCH, C.E., A.M.,  
KENWICK PROFESSOR OF CIVIL ENGINEERING, COLUMBIA UNIVERSITY.

**CORRELATION AND CROSS-REFERENCES**  
HELEN READY BIRD,  
ASSISTANT TO THE EDITOR

**CROP PRODUCTION; UNITED STATES DEPARTMENT OF AGRICULTURE**  
JOHN I. SCHULTE, B. Agr.,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**DRAMA AND THEATRE**  
RALPH W. CAREY,  
NEW YORK DRAMATIC CORRESPONDENT, *The Hartford Courant*.

## KEY TO PRONUNCIATION

- æ** as in *ale, fate*. Also see **ɛ**, below.
- ā** " " senate, chaotic.
- ā** " " glare, care, and as *e* in *there*. See **ɛ**, below.
- ā** " " am, at.
- ā** " " arm, father.
- ā** " " ant, and final *a* in *America, armada*, etc.  
In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (**ʊ**).
- ɑ** " " final, regal, where it is of a neutral or obscure quality.
- ā** " " all, fall.
- ā** " " eve.
- ē** " " elate, evade.
- ē** " " end, pet. The characters **ē**, **ā**, and **ā** are used for **ā**, **ae** in German, as in *Baedecker, Grafe, Handel*, to the values of which they are the nearest English vowel sounds. The sound of Swedish **ā** is also sometimes indicated by **ē**, sometimes by **ā** or **ā**.
- ē** " " fern, her, and as *i* in *sir*. Also for **ē**, **oe**, in German, as in *Gothe, Goethe, Ortel, Oertel*, and for *eu* and *œu* in French, as in *Neufchâtel, Crèvecoeur*; to which it is the nearest English vowel sound.
- e** " " agency, judgment, where it is of a neutral or obscure quality.
- i** " " ice, quiet.
- i** " " quiescent.
- i** " " ill, fit.
- i** " " old, sober.
- ō** " " obey, sobriety.
- ō** " " orb, nor.
- ō** " " odd, forest, not.
- o** " " atom, carol, where it has a neutral or obscure quality.
- oi** " " oil, boil, and for *eu* in German, as in *Feuerbach*.
- oo** " " food, fool, and as *u* in *rude, rule*.
- oo** " " foot, wool.
- ou** " " house, mouse.
- ū** " " use, mule.
- ū** " " unite.
- ū** " " cut, but.
- u** " " full, put, or as *oo* in *foot, book*. Also for *u* in German, as in *Munchen, Muller*, and *u* in French, as in *Buchez, Budé*; to which it approximates in English.
- ū** " " urn, burn.
- y** " " yet, yield.
- h** " " the Spanish *Habana, Córdoba*, where it is like a *v* made with the lips alone, instead of with the teeth and lips.
- ch** " " chair, cheese.
- d** as in the Spanish *Almodovar, pulgada*, where it is nearly like *th* in English *then*, this.
- g** " " go, get.
- g** " " the German *Landtag*, and *ch* in *Feuerbach, buch*; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
- h** " *j* in the Spanish *Jijona, g* in the Spanish *gila*; where it is a fricative somewhat resembling the sound of *h* in English *hue* or *y* in *yet*, but stronger.
- hw** " *wh* in which.
- x** " *ch* in the German *ich, Albrecht*, and *g* in the German *Arensberg, Mecklenburg*; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of *h* in *hue*, or *y* in *yet*; or the sound made by beginning to pronounce a *k*, but not completing the stoppage of the breath. The character **x** is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of *kh* in the word *Khan*.
- ŋ** " in *sinker, longer*.
- ng** " " sing, long.
- n** " " the French *bon, Bourbon*, and *m* in the French *Étampes*; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by **n**, as in the case of *São Antão*.
- sh** " " shine, shut.
- th** " " thrust, thin.
- th** " " then, this.
- zh** " *z* in *azure*, and *s* in *pleasure*.  
An apostrophe [*ʼ*] is sometimes used to denote a glide or neutral connecting vowel, as in *tā'b'l* (table), *kāz'm* (chasm).
- Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
- When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in *THE NEW INTERNATIONAL ENCYCLOPÆDIA* and in *THE NEW STANDARD DICTIONARY*.

# THE NEW INTERNATIONAL YEAR BOOK

**ABALLI, RAFAEL SANCHEZ.** A Cuban engineer, died Apr. 4, 1932, in Cuba, where he was born. He was educated in Cuba and the United States, where he received an M.E. degree at Lehigh University at Bethlehem, Pa. He then applied his engineering knowledge to the sugar industry and to stock raising. He served as ambassador from Cuba to the United States in 1926, but through an unfortunate accident was compelled to resign. He was then appointed secretary of communications in the Cuban Cabinet and served several years. Through his untiring efforts air-mail service was established between the United States and Cuba and Central and South America. He was engaged as a consultant for the sugar industry at the time of his death.

**ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).** The oldest of the five academies which make up the Institute of France and officially considered the highest, founded in 1635, reorganized in 1816. The membership is limited to 40. The list of the Immortals at the beginning of 1932, in order of their election, was as follows: Paul Bourget, Gabriel Hanotaux, Henri Lavedan; René Bazin (q.v.); Maurice Donnay; Raymond Poincaré; Eugène Brieux (q.v.); René Doumic, Marcel Prévost; Henri de Régner; le maréchal Louis Lyauté; Pierre de la Gorce; Henri Bergson; Louis Barthou; Mgr. Alfred Baudrillat; Jules Cambon, Henri Bordeaux; Joseph Bédier, André Chevrillon; Pierre de Nolhac; Georges Goyau; Henri Brémond, Edouard Estaunié; Henri Robert; Camille Julian, Georges Lecomte, Émile Picard; Albert Besnard; Louis Bertrand; Auguste de Caumont, duc de la Force; Paul Valéry, Abel Hermant; Émile Mâle; Louis Madelin, Maurice Paléologue; le maréchal Henri Pétain; André Chaumeix, Charles Le Goffic (q.v.); Gen. Max Weygand; and Pierre Benoit. Elections at the June meeting brought to the Academy Abel Bonnard, the novelist, and at the November meeting the historian of the French Revolution, Lenôtre (pseudonym of L. L. T. Gosselin). There was published in April the *Grammaire de l'Académie Française* (see **FRENCH LITERATURE**).

## **ACADEMY OF ARTS AND LETTERS,**

**AMERICAN.** A society founded in 1904 by members of the National Institute of Arts and Letters, its charter of incorporation being approved by Act of Congress Apr. 17, 1916. It corresponds to the French Academy, its membership being limited to 50 chairs, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music.

The membership of the academy as of Nov. 10, 1932, consisted of the following in the order of their election: Robert Underwood Johnson, Henry van Dyke, Edwin Howland Blashfield, George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Owen Wister, Herbert Adams, Augustus Thomas, Cass Gilbert, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Gari Melchers, Elhu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Charles Adams Platt, Archer Milton Huntington, Child Hassam, Lorado Taft, Newton Booth Tarkington, Charles Dana Gibson, John Charles Van Dyke, Royal Cortissoz, Henry Hadley, Charles Downer Hazen, George Pierce Baker, Wilbur L. Cross, Herman A. MacNeil, John Russell Pope, Edwin Arlington Robinson, James Earle Fraser, John Huston Finley, William Mitchell Kendall, Edwin Markham, Robert Frost, Irving Babbitt, James Tinslow Adams, Edith Wharton, George Grey Barnard, Charles Martin Loeffler, William Lyon Phelps, and Adolph Alexander Weinman.

At the annual meeting on Nov. 10, 1932, the following new members were elected: Walter Damrosch, Anna Hyatt Huntington, and Paul Manship. Dr. John H. Finley presented to David Ross of the Columbia Broadcasting System the academy's medal for good diction on the radio. Miss Alexandra Carlisle, then appearing in *Criminal at Large*, was the recipient of the academy's medal for good diction on the stage, the presentation being made by Prof. George Pierce Baker. The Humanist leader, Prof. Irving Babbitt, gave the thirteenth address on the Evangelical Wilbour Blashfield Foundation, entitled "The Problem of Style in a Democracy." Prof. William Lyon Phelps extended the academy's greetings to Henry van Dyke on his eightieth birthday, and Robert Underwood Johnson and Edwin Markham read poems which they had written in honor of the occasion. There were also held in connection with the annual meeting an exhibition of the paintings of Gari Melchers

(q.v.), and the sixth concert of all American music.

The officers of the academy in 1932 were: President, Nicholas Murray Butler, chancellor and treasurer, Willbur L. Cross, secretary, Robert Underwood Johnson; directors, Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, Cass Gilbert, Archer Milton Huntington. Administrative offices are at 633 West 155th Street, New York City.

**ACCIDENTS.** See RAILWAY ACCIDENTS; SAFETY AT SEA; WORKMEN'S COMPENSATION

**ADELBERT COLLEGE.** The men's college of liberal arts and sciences at Western Reserve University (q.v.)

**ADELPHI COLLEGE.** A nonsectarian college of arts and sciences for women in Garden City, N. Y., incorporated in 1896. Adelphi was located in Brooklyn, N. Y., until the autumn of 1929 when it was transferred to its new home in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1932 was 474 students. The faculty numbered 44. The endowment was \$892,799, while the income for 1931-32 was \$231,165. The library contained 31,693 volumes. President, Frank Dickinson Blodgett, LL.D.

**ADEN,** a'den or ā'den. An important, fortified coaling-station and transshipment point on the water route to the East, situated on a volcanic peninsula on the southwestern coast of Arabia about 100 miles east of the Strait of Bab-el Mandeb; belonging to Great Britain since 1839. The area of the peninsula is 75 square miles and that of Aden protectorate, including the hinterland, the peninsula of Little Aden, and the island of Perim, 9000 square miles. Population of Aden and Perim in 1931, 51,478, largely Mohammedan.

The chief commercial centre of the Arabian peninsula, Aden's total imports, including treasure, in 1930-31 amounted to 62,571,901 rupees (rupee exchanged at \$0.3369 in 1931). Exports, including treasure, aggregated 43,126,811 rupees. The above statistics do not include government stores and treasure. Cotton piece goods, fuel oil, gasoline, grain, hides and skins, tobacco, coal, and provisions are the principal commodities of trade. Salt and cigarettes are manufactured locally. Merchant vessels entering the port of Aden in 1930 31 numbered 1577 of 5,805,529 net tons. Entrances at Perim numbered 532. In 1930-31 the total receipts amounted to 6,283,078 rupees, the expenditure to 6,252,619 rupees.

Attached to Aden are the Kuria Muria Islands, ceded by the Sultan of Muscat for use as a landing for the Red Sea cable. Effective Apr 1, 1932, Aden and its dependencies were transferred from the administration of the Provincial Government of Bombay to that of the Governor-General of India in Council and established as the Chief Commissionership of Aden. Lieut.-Col. B. R. Reilly, the Resident and Commander-in-Chief, was appointed Chief Commissioner. Control of Aden was formerly divided between the Provincial Government of Bombay and the government of India.

**ADRIAN, PROF. EDGAR D.** See NOBEL PRIZES.

**ADULT EDUCATION, AMERICAN ASSOCIATION FOR.** An organization founded in 1926 to serve as a national clearing house of informa-

tion concerning adult education activities. Its main effort is directed toward supplying a medium of exchange for teachers and administrators who are in direct contact with adults and their demands. The association seeks also to publish and to assist in the publication of material useful to those who are working in this field and to conduct studies of problems fundamental to it. Among the agencies which are actively promoting adult education, and with which the association is in close contact, are the public schools, libraries, museums, extension services of departments of the Federal Government and of colleges, universities, and professional schools, corporation schools, workers' schools and classes, fraternal and religious associations, child-study and parent-education groups, and almost an infinite variety of clubs and other organizations.

The greatly augmented interest in occupational education, growing out of the economic depression and the widespread unemployment, led the American Association for Adult Education to undertake during 1932 a number of studies of existing experiments in this field. The first of these studies dealt with the work of the Denver Opportunity School, which has been maintained in Denver, Colo., since 1916 by tax funds under the public school authority. The association published a report of this study under the title, *What is this Opportunity School?* The results of a special experiment, carried on at the opportunity schools for whites and Negroes maintained by the State Board of Education of South Carolina, were published by the association in a bulletin entitled *The Opportunity Schools of South Carolina*.

In the fall of 1931 Nathaniel Peffer completed a study of adult education in industry made for the association. Mr. Peffer's year of investigation resulted in a book published under the title, *Educational Experiments in Industry* (Macmillan, 1932), in which are briefly described the educational opportunities offered by a number of industrial concerns for the purpose of training their employees for their jobs on the job. A study of adult education facilities and activities in rural communities and small towns was also completed during the year. A book on the subject is to be published early in the spring of 1933.

The seventh annual meeting of the American Association for Adult Education was held in Buffalo, N. Y., in May, 1932. The programme of the meeting consisted of a series of discussions on the possible contribution of adult education to the intelligent handling of present-day social and economic problems. The discussions were conducted by the so-called panel method, which provides for a public discussion of a subject by a chairman and a group, or panel, of special qualified persons, followed by a period in which the discussion is opened to the entire assemblage. This method has been widely used by adult education agencies since its successful demonstration at Buffalo.

At the annual meeting the following officers were elected: President, Dorothy Canfield Fisher; vice presidents, Ethel Richardson Allen, William A. Neilson, Adam Strohm, Charles A. Beard, Alvin S. Johnson, chairman, James E. Russell; secretary, Jennie M. Flexner, treasurer, Chauncey J. Hamlin. Headquarters are at 60 East Forty-second Street, New York City.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** This organization was

founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1932 its membership included 18,802 individuals interested in the advancement of science and the progress of knowledge and education. There were also 136 autonomous and independent associated scientific societies, of which 100 were officially affiliated with the association, 26 being local academies of science. The association has 15 sections representing the main current subdivisions of science: mathematics, physics, chemistry, astronomy, geology and geography, zoological sciences, botanical sciences, anthropology, psychology, social and economic sciences, historical and philological sciences, engineering, medical sciences, agriculture, and education.

The ninety-first meeting of the association was held in Atlantic City, N. J., Dec. 27-31, 1932, with an attendance of about 3000 scientists from all parts of the United States and Canada. There were also 39 scientific organizations meeting with the association. The address of the retiring president, Dr. Franz Boas, at the opening session was entitled "The Aims of Anthropological Research." Among the general lectures were: "Fact and Fancv in Cosmogony," by Harlow Shapley, "The Social Effects of Mass Production," by Dexter S. Kimball, "The Constitution of the Stars," by Henry Norris Russell, and "Thermodynamics and Relativity," by Richard C. Tolman. At the section meetings more than 1400 papers were presented. The ninth prize of \$1000 for the paper read at the annual meeting describing "a noteworthy contribution to science" was awarded to Henry Fyning of Princeton University for "Quantum Mechanics and Chemistry with Particular Reference to Reaction Involving Conjugate Double Bonds." The science exhibition was well developed, with exhibits by commercial firms, individuals, scientific organizations, educational institutions, and government bureaus.

The national summer meeting in 1932 was held in Syracuse, N. Y., June 20-25; that for 1933 was to be held in conjunction with the Century of Progress Exposition in Chicago, June 19-30. The next winter meeting was to be held in Boston Dec. 27, 1933, to Jan. 2, 1934. There were held the usual annual and other meetings of the two regional divisions under the auspices of the association. The Pacific division, including the Pacific States, Alaska, and the Hawaiian Islands; and the Southwestern division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico.

The official organ of the association is a weekly journal, *Science*. In addition the association issues the *Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science, and publishes at four-year intervals a volume of *Summarized Proceedings*, including a directory of members. The permanent endowment of the association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1932, to \$200,774. Grants are made annually to individuals or scientific organizations to promote research.

The president of the association in 1932 was John Jacob Abel, professor of pharmacology at the Johns Hopkins University, who assumed office at the opening session of the Atlantic City

meeting. The president-elect for 1933 was Henry Norris Russell, professor of astronomy at Princeton University. The other officers were: permanent secretary, Henry B. Ward; general secretary, Burton E. Livingston; and treasurer, John L. Wirt. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

**ADVENT CHRISTIAN CHURCH.** See ADVENTISTS.

**ADVENTISTS.** The Advent Movement had its origin in America with William Miller, who believed not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The movement, however, began in England and on the Continent, under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving, in England, and the Rev. Joseph Wolfe, D.D., LL.D., in Prussia. A Prophetic Conference was held in Albury Park in 1836, at the residence of Henry Drummond, Esq., afterwards a member of the British Parliament, with "eight days of serious study of the prophecies," at which the Rev. Hugh McNeile presided. The first general gathering in America of those interested took place in Boston in October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held in Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Advent Christian Church in 1855, and including the Seventh-Day Adventists, organized in 1860, Life and Advent Union, in 1864, The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

**ADVENT CHRISTIAN CHURCH.** This church which is congregational in church government holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. Statistics reported for 1932, covering 43 conferences, showed 469 churches, 485 ordained ministers, 81 licensed ministers, 27,940 church members, 332 Sunday schools, 19,102 Sunday-school members, 93 Senior Young People's Societies of Loyal Workers, with 2181 members, and 19 Junior Young People's Societies with 325 members. The denomination maintains three publication societies and two educational institutions: Aurora College in Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include *The World's Crisis* (Boston), *Messiah's Advocate* (Oakland, Calif.), and *Present Truth Messenger* (Live Oak, Fla.). Among the philanthropic institutions of the denomination are the American Advent Christian Home and Orphanage in Dowling Park, Fla., and the Vernon Home for ministers and missionaries in South Vernon, Mass. The biennial general conference of the Advent Christian Church was held in Plainville, Conn., June 24-27, 1932. The officers in 1932 were Irving F. Barnes, D.D., president; T. P. Stevens, Burr A. D. Bixler, Lee E. Baker, H. J. Wilson, vice presidents; C. H. Hewitt, secretary; F. C. Webster, treasurer. The General Conference Headquarters is at 160 Warren St., Boston.

**SEVENTH-DAY ADVENTISTS.** This denomination, which is the largest of the Adventist group, embraces nine union conferences in the United States

and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, although under the general supervision of the conference. The statistical report of the denomination for 1931 indicated 2258 churches in the North American division, 915 ordained ministers, and 127,787 church members. Sabbath schools which numbered 2793 had a membership of 130,343.

The foreign divisions, including the Australasian, Central European, Chinese, Far Eastern, Inter-American, Northern European, Southern African, South American, South Asian, Southern European, and Union of Soviet Socialist Republics divisions, consisted of 4763 churches, 1167 ordained ministers, 208,259 church members, and 7785 Sabbath schools with an enrollment of 280,371. Throughout the world there was an increase in membership of 21,793 over 1930. The work was conducted in 141 countries by 71 union conferences, 155 local conferences, and 278 mission field organizations, employing 21,607 evangelistic and institutional laborers.

The movement maintains in the United States and Canada 104 educational institutions, which in 1931 had an enrollment of 14,913 students. There are also maintained in foreign countries 92 educational institutions with an enrollment of 9264 students. The denomination has 19 publishing houses in North America and 49 in other countries. During 1931 denominational literature was issued in 152 languages, and evangelistic work was conducted in 141 countries using orally 303 languages and dialects. Total contributions from all sources for this work amounted to \$7,291,177 for the North American division, and to \$3,742,984 for the other divisions. The headquarters of the General Conference of Seventh-Day Adventists are at Takoma Park, Washington, D. C.

**AERIAL PHOTOGRAPHY.** See PHOTOGRAPHY.

**AERONAUTICS.** As in the past several years, the furtherance of air transport for commercial purposes continued to be the aim in aeronautics during the year 1932. In the United States the closing month showed, perhaps, the greatest constructive progress of any month in the year in three directions: First, the inauguration of a solid express service between New York and Los Angeles, to operate daily and on a 17-hour schedule. The second was the amalgamation of conflicting transportation companies, operating chiefly east of the Mississippi. Simultaneously, in the third direction, a great increase in the facilities of commercial transportation with Central and with South America, with possible transatlantic routes, was announced.

Although the close of the year saw a 10 per cent reduction in the scheduled daily average plane miles of air transport below that of the close of the previous year, the decrease was gradual and, from the operating standpoint, loss of income was in part offset through more economical management and through an increase in the pay load per plane. The year was notable for the relatively few serious accidents, and for the number and nature of the new records in competitive, long distance, and altitude flights. Solo flights by women were especially noteworthy.

**NATIONAL BALLOON RACE.** The National Elimination Balloon Race started at Omaha, Neb., on May 30, and was won by Lieut. Wilfred J. Paul and Lieut. K. J. H. Bishop, flying the U. S. Army balloon No. 2. The official distance covered by the balloon to its landing place near Hatton, Sask., Canada was 901.4 miles after 29 hours and 15 minutes in the air, thus establishing new records both for distance and duration for balloons of 35,000 cu. ft. capacity. Second place went to the pilots of the *Goodyear VII*, piloted by Roland Blair and Frank A. Trotter, who landed near Tyvan, Sask., Canada, a distance of 709.9 miles. Third place went to *Army No. 1* with Capt. W. J. Flood, pilot, and Lieut. H. McCormick, aide, who covered a distance of approximately 605 miles. Lack of available funds, however, prevented the winners of the elimination contest from entering the Bennett races in September.

**BENNETT BALLOON RACE.** The 1932 James Gordon Bennett Balloon Race was started from Basle, Switzerland, on September 25. For the sixth consecutive race, first place was taken by an entry from the United States. The U. S. Navy balloon, piloted by Lieut. Com. T. G. W. Settle and Lieut. Wilfred Bushnell, covered 921 miles in storm and wind before being forced to earth on September 27 at Dutszty, close to the Polish-Latvian border. Second place went to Ward T. Van Orman and R. J. Blair, of the United States, winner of the 1930 and of the 1931 cups, who covered about 830 miles in the *Goodyear VIII*. Out of the 16 entries, the French *Petit Mouse* made the third place, about 740 miles, and the Polish *Polonia*, the fourth.

**ALTITUDE RECORDS.** In the interests of technical research, three test balloons were sent aloft at Stuttgart, Germany by Prof. Ehrich Regener on June 28. The balloons, of 6½-foot diameter, were connected, and jointly carried a basket with measuring instruments, and were hauled down after three hours. An altitude of 65,000 feet was recorded, about 14,000 feet higher than that attained by Prof. Auguste Piccard in 1931. On August 13, Professor Regener made a similar test and succeeded in sending his balloon to the altitude of 92,000 feet, almost double any previous experimental altitude. His photographs taken at various elevations in the ascent, tended to disprove the theory of a proportionate increase in cosmic ray intensity at increasing heights.

On August 18, Prof. Auguste Piccard made a second voyage into the stratosphere, using the same spherical metal cabin that he employed the previous year. His aide on this expedition was Max Cosyns. The flight started from Zurich, Switzerland, in the early morning, and was ended near Lake Garda, Italy, in the late afternoon. The balloon was the same that had been used in 1931, 98 feet in diameter, with a capacity of 494,400 cu. ft. An altitude estimated at 16,500 meters (54,120 ft.) was reached at the peak of the ascent, and numerous observations were made by the two scientists. No mishaps marred the success of the flight, and the flight was followed without difficulty by two aeroplanes and four motor cars, with which Professor Piccard kept in touch by radio. The ascent of 1931 reached an altitude of 51,793.2 ft. Except for the intense cold, which is relatively constant at 50° to 60° below zero Fahrenheit, Professor Piccard reported that the stratosphere would be ideal for the aviation of the future, as there are

neither clouds nor storms to interfere with flight and atmospheric currents are constant and of mild intensity. He plans a future ascent in the region of Hudson Bay, Canada.

On September 16, an official altitude record for aeroplanes was established by Capt. Cyril Unwins at Bristol, England. Flying a Bristol aeroplane, engined with a 550 h.p. Pegasus motor, Captain Unwins reached an altitude of 43,976 feet. The previous record, established by Lieut. Apollo Soucek, U.S.N., in 1930, was 43,166 feet.

**U. S. AIRSHIPS.** The U. S. S. *Los Angeles*, after almost eight years of service, was decommissioned on June 30. Built in Germany as an item of reparations, and flown to the United States in 72 hours, she was commissioned on Nov. 25, 1924. Her withdrawal from active service, according to the annual report of the Chief of the Bureau of Aeronautics, was for the purpose of effecting economies. The ship is housed in her hangar at Lakehurst and can be recommissioned on 30 days' notice. A stipulation in the provisions for her original construction, however, was that it would never be employed in military operations, and its future use is, therefore, contingent upon its further value as a training ship or on its operation for commercial purposes.

The U. S. S. *Akron*, which was commissioned late in 1931, suffered a slight accident in February because of a suddenly rising storm while she was being hauled from her hangar. This necessitated about six weeks' repair work, but in April she flew to the west coast and maintained efficient service thereafter. Although, for educational purposes, she has made numerous demonstration flights over many parts of the country, unlike the *Los Angeles*, the *Akron* is essentially a military unit and her flights have been largely for the determination of her fitness in that field. Among the tests that have been conducted are the launching and pick-up, while in flight, of small single-seater fighting aeroplanes. These planes, of which the present complement is five, are hangared within the envelope of the *Akron*. In launching them, one by one, they are suspended from a trapeze and lowered by it through a T-shaped opening; the engines, previously started to prevent a backward swing of the planes, are accelerated to synchronize with the speed of the *Akron*, and the pilots then trip a release and dive away. The return to the mother craft involves considerable skill, for the pilot must maneuver his small plane to engage with the trapeze. Patient experimentation and practice have developed a degree of perfection that demonstrate that such launchings and returns are entirely practicable, 127 such hook-ups having been made within one day.

In the further interests of the development of lighter-than-air craft, and to reduce the large ground crews that have been required to handle ships of the size of the *Akron*, experiments have been made during the year with a mobile, extensible mooring mast. The mast, operating on tracks under its own power, can be extended 160 feet into the air, and telescoped low enough to permit the airship to be drawn by it into the hangar. The initial device is intended to be used at the new airship base at Sunnyvale, Calif.

When the *Akron* was completed in 1931, work was immediately begun at Akron toward the assembly of the U. S. S. *Macon*. By September of 1932 the framework of this airship was reported

about 95 per cent complete, and the full completion is expected early in 1933. In its construction advantage has been taken from lessons learned from the *Akron* to incorporate a number of refinements and improvements, including a reduction in dead weight.

It was expected that the U. S. Army non-rigid airship, *TC-13*, would have been completed by the end of the year 1932. Congressional appropriations were pared down to so low a figure as to delay completion. This ship is to be used by the Air Corps for coastal patrols, and is the largest non-rigid airship in the United States. It has an overall length of 233 feet, a diameter of 54 feet, and a capacity of 360,000 cubic feet. The non-inflammable helium provides a gross lift of 22,300 lb. The cruising range at the low speed of 25 m.p.h. is 2500 miles; at higher speeds this is reduced to 100 miles at 65 m.p.h. Fuel can be picked up during flight.

The ship is powered by two 375 h.p. engines geared to three-bladed propellers. The car, internally suspended, is flush with the envelope, and has space for a crew of three pilots, two mechanics, a navigator, a radio operator, and a bomber, with sleeping accommodations. Fuel, water, and storage tanks may be dropped at the will of the pilot to provide greater buoyancy in emergency. While the ship is concealed within or above the clouds, a sub-cloud car may be lowered, so that an observer therein may report his observations by radio.

**GRAF ZEPPELIN.** On June 28, the *Graf Zeppelin*, in a trip over Switzerland, completed successfully its 250th flight. On March 20, she started a round trip to Buenos Aires, returning to her base at Friedrichshafen on the tenth day, thereby establishing a new record for mail delivery at each end. The trip was so satisfactory that negotiations were started for a scheduled route to and from Brazil. She made two to Pernambuco in April, and nine were completed by fall. The trip one way occupies three days and it is reported that each trip, with passengers, express, and mail, has been successful in financial operation. It is reported that the cost for transporting the huge ship from airport to airport is \$16,000 or about \$3 a mile. Against this a passenger fare of \$476.20 and mail cargoes producing a revenue of about \$10,000 a trip, have enabled the company to show a slight profit. With a fleet of at least two ships and sailings each week, it is believed that commercial loads probably more than double those of this year could be assured.

**AVIATION.** Despite the continued period of hard times, travel by air showed a slight but gratifying increase. This increase, offset by lowered fares, did not encourage manufacturers to develop new types of planes. Improvements were in the lines of more efficient engines, propellers, and in refinements of details. An exception, however, is the Beech biplane, which embodies unusual features. This ship, designed by Walter Beech, formerly president of the Curtiss-Wright Company, is a notable departure from accepted American practice by virtue of high degree of negative stagger—38 per cent—of the two wings. Wind-tunnel tests and actual flight have demonstrated that the ordinary difficulties introduced by negative stagger—a tendency of the lower wing to blanket the upper wing, at times resulting in a stall or a spin, and a tendency to pick up speed in a glide—have been overcome

in the design. The main advantages of the type are sharply demonstrated in improvement in visibility from the forward cockpit.

Increased interest has been shown in the autogiro. In January, Capt. L. A. Yancey flew from New York to Cuba, and within a few days continued his flight to Mexico, thence to Yucatan where he landed on an ancient Mayan ruin to demonstrate the practicability of this type of machine for explorations in regions devoid of adequate space for the landing and take-off of aeroplanes. And in September, to prove feasibility at high altitudes, he ascended to something more than 20,000 feet. Cabin planes, with accommodations for four or five persons, have been constructed and tested.

**LARGE PASSENGER PLANES.** The Dornier DO-X, described in previous YEAR BOOKS, after a protracted trip from Germany landed at New York, August, 1931. After several exhibition flights this large ship was laid up until the spring of 1932 when she made a few test flights and on May 19 started the return trip to Germany. Shortage of fuel forced her down a few miles from the Azores, where, after refueling, she resumed her flight via Spain and England, arriving at her airport near Berlin on May 24.

In recent years the commercial operators encouraged the development of planes with large seating capacities; but some of them have realized that economical operation is not achieved, under present conditions, through a provision for excess requirements. A half-empty giant plane that would seat 20 is greatly more expensive in flight than a full one seating 10. In the United States, the United Air Lines has conservatively sacrificed capacity to speed, with the obvious reasoning that, if traffic warrants, the number of scheduled sailings can be increased. Consequently, this company announced a full schedule that would utilize some of the new ten-seater Boeing transports. But in place of the former 120 m.p.h. service, the new planes have a cruising speed of 155 m.p.h. The new machine, developed from the Boeing bomber, has a wing span of 74 feet, and with two Pratt and Whitney supercharged Wasp engines of 550 h.p. each, a gas load of 220 gal., will have a pay load of 2400 lbs. The comfort of the passenger is provided by ample head-room, individual reading lamps, and a cabin heated in winter and cooled in summer. The flying schedule of the new ships calls for 23 hours between San Francisco and New York and about five and a half hours between Chicago and New York.

Second in size to the DO-X is the new U. S. Navy plane completed in the fall of the year. This giant cruiser is entirely experimental, but if expectations are fulfilled the builders, the Hall-Aluminum Aircraft Corporation, anticipate further orders for this type. The machine powered by four Curtiss motors, has a wing spread of 100 feet, capable of supporting ample fuel, oil, and pay load for a cruising range of 3000 miles. In its design and construction the builders had in mind the possible utility of the type for commercial transatlantic flight via the Bahama Islands and the Azores.

**THE SPEED PLANES.** In view of the sustained exploits attending the National Air Races at Cleveland in the closing days of August, and early September, interest was focused on the plane in which Major James H. Doolittle bettered the world's land plane speed record of

eight years' standing, and the plane in which his racing partner, James Haizlip, established a new transcontinental record. The racer piloted by Doolittle, but owned by Russell Boardman who, through an injury, was unable to fly it, was a GeeBee super sport model built by Granville Bros., and powered by an 800-h.p. Pratt and Whitney Wasp engine. The official average speed for the course was 294.386 m.p.h. The plane used by Haizlip was built by the Wedell-Williams Air Service Corp., and powered by a Wasp Junior engine that developed about 550 h.p. The elapse of time between the Los Angeles airport at Burbank and the New York airport at Floyd Bennett Field, a distance of 2470 miles, was 10 hours and 19 minutes, almost 57 minutes less than the record established by Major Doolittle in the previous year.

**NATIONAL AIR RACE MEETING.** The 1932 National Air Race Meeting was held in Cleveland, O., August 27 to September 5. The Bendix Trophy Race and the Cord Cup Race, a transcontinental handicap derby, preceded the contests actually held at the Cleveland airport. The former was won by James H. Haizlip, in the Wedell-Williams plane described before in the remarkable time—Los Angeles to Cleveland—of 8 hours, 19 minutes, 45.79 seconds. Second place was won by J. R. Wedell in 8 hours, 47 minutes, 31 seconds, and third place by Col. Roscoe Turner in 9 hours, 2 minutes, 25.23 seconds. The first three planes were built by the same company, powered by motors of the same make. All three bettered the winning time of 1931 of 9 hours, 10 minutes, 21 seconds. Haizlip and Turner continued to New York, and both arrived there inside of the previous transcontinental record, Haizlip's time being 10 hours and 21 minutes; Turner's 10 hours, 58 minutes, as against the previous record established by Major Doolittle of 11 hours and 16 minutes.

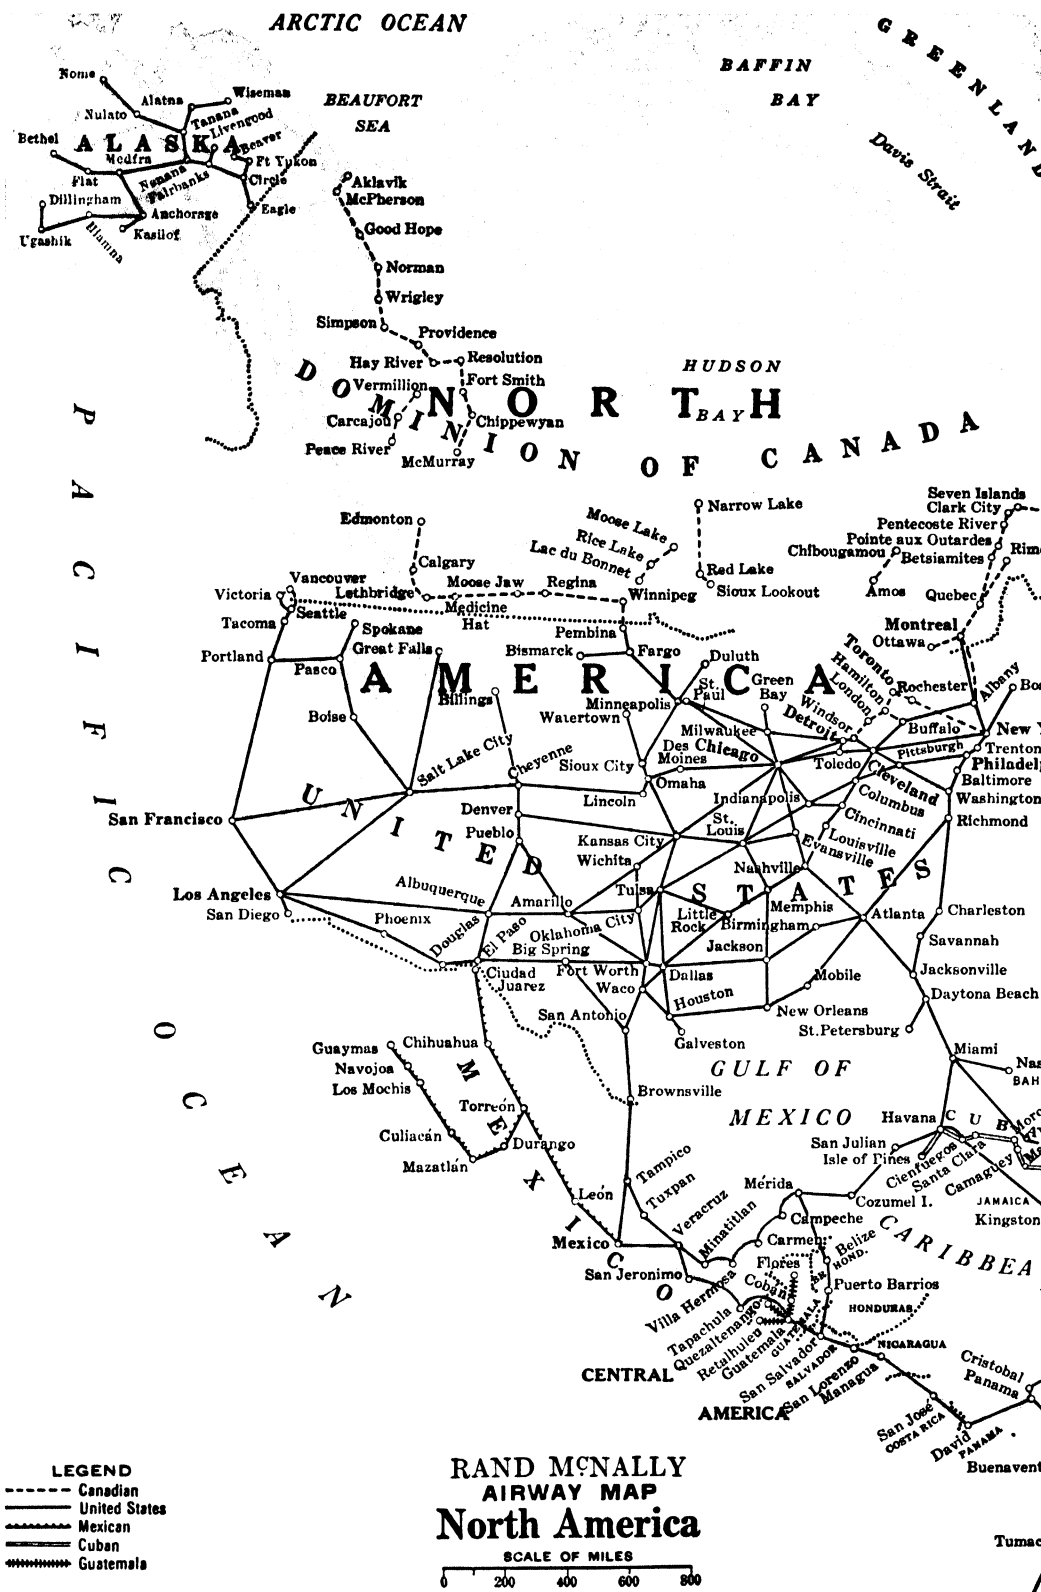

The Cord Cup Race, or Transcontinental Handicap Air Derby, was in two divisions—the western division leaving Los Angeles as the eastern division left Washington, D. C., and taking prescribed courses that covered equal distances meeting in Bartlesville, Okla., and finishing at Cleveland. The prize for the Pacific Wing, in which 38 contestants finished, was awarded to Roy Hunt, flying a Great Lakes plane with a Cirrus motor; that for the Atlantic Wing went to S. C. Huffman in a Waco plane powered by a Continental engine.

In the hundred-mile Thompson Trophy Race, in which the qualifying speed is 200 m.p.h., there were eight entrants. The race was won by Major James H. Doolittle in the GeeBee sport racer, described before, in the fast time of 23 minutes, 44.69 seconds, with an average speed of 252.686 m.p.h. Second, third, and fourth places were taken by Wedell, Turner, and Haizlip, respectively, each of whom exceeded 230 m.p.h. in average speed.

The Phillips Trophy Race, introduced to encourage the building of planes of lower horsepower, was won by Ray Moore, in a Keith-Rydic monoplane with Menasco motor, who covered the 80 miles in 25 minutes 20½ seconds, an average speed of 182.22 m.p.h. Second place was taken by Ben O. Howard in a Howard racer, Menasco motor, with a speed of 177.635 m.p.h., and closely trailed for third place by Roy Liggett, flying a tiny Cessna, Warner motor, at 176.519 m.p.h.

Three races were limited to women entrants only. The Aerol Trophy Race had four entrants; but as the race was called at the end of the fourth lap because of a heavy rain, the results were somewhat inconclusive. Officially, first place was awarded to Gladys O'Donnell, flying a Howard plane, Menasco motor; second place to May Haizlip, flying her husband's Wedell-Williams; third to Florence Klingensmith, in a Monocoupe, Warner motor, and fourth to Bettie Lund, in a Waco plane, Wright engine. The Amelia Earhart Trophy was won by Florence Klingensmith, with Edith Foltz and Helen Richey, each flying Bird planes with Kinner motors, taking second and third places. In the Shell Speed Dash for women, for a world's record over a three-kilometer course, the winning time and world's record was established by May Haizlip who covered the distance with an average speed of 411.209 kilometers (255.513 miles) per hour.

In the same event for men, as previously described, Major Doolittle set up a new world's record of 476.829 kilometers (296.287 miles) per hour.

**KING'S CUP AIR RACE.** On July 9, the annual British handicap for the King's Cup over a course of 1233 miles, was won by Capt. W. L. Hope, the victor in 1927 and 1928. In the two days' flight that circled southern England, Captain Hope piloted his Fox Moth over the course for an average speed of 124.25 m.p.h. The entry of the Prince of Wales, a Comper-Swift, flown by Flight Lieut. E. H. Fielden came in second with an average speed of 155.75 m.p.h. The fastest time for the race and a new record for the course was recorded by H. A. Brown in an Aero Mail Carrier, showing 176 m.p.h. for the entire distance.

**SCHNEIDER TROPHY.** The air races for the trophy offered by Jacques Schneider, of France, in 1913 and annually after the World War, were discontinued on the grounds that they had "outlived their usefulness," according to the announcement of Sir Philip Sassoon, Under-Secretary for Air, of England. Formerly the competition was supported by the various governments participating in the races, but more recently the expenses have been borne by private individuals or commercial manufacturers, and representatives of the various nations have been gradually withdrawing. The United States has not been represented since its victory in 1925, and in 1931 English planes were the only entries. The expenses of the last contest were met by Lady Houston, when the British government refused to bear the costs.

**NOTABLE FLIGHTS.** The increasing reliability of the aeroplane for distance, altitude, and speed, was demonstrated during the year to a far greater degree than in many years. Long distance flights surpassing anything of previous years became so commonplace as to pass almost unnoticed. Spectacular flights that accomplish little in the furtherance of commercial aviation held the limelight as usual; and those flights, if not successful through inadequate preparation, served to retard the development of air travel. The more outstanding flights of the year are given here more or less chronologically.

On March 28, James A. Mollison, who last year flew from Wyndham, West Australia to London, 10,000 miles, in 8 days, 20 hours, 19 minutes, completed the last hop of the 6200-mile flight from Lympne Airdrome, Kent, England

to Cape Town, South Africa. The flight was accomplished in 4 days, 17½ hours. The route selected, the west coast, led him over 2000 miles of the Sahara Desert on which he landed once for a brief rest. Although faced most of the way by a strong seasonal southerly wind, the trip was without accident until its completion at Cape Town, where a blinding searchlight caused him to crash in landing, although without injury to himself, but wrecking his tiny Puss Moth plane.

Two French fliers, Captain Goulette and Lieutenant Salel, on April 21, arrived at Cape Town in a Farman Lorraine monoplane, in less than 100 hours of flight from Europe. The actual time from Le Bourget Field, France to Cape Town was 3 days, 19 hours, 15 minutes, about 20 hours, with allowance for distance, better than the time established by Mollison.

In China, the Ford tri-motored all-metal monoplane, purchased by Marshal Chang Hsiao-hang, former governor of Manchuria, on April 21 made a one-stop flight from Hongkong to Peiping, a distance of 1275 miles. The stop at Hankow was made only to obtain fuel. This was the first flight of such a distance in China.

On April 28, C. W. A. Scott, in a Gipsy Moth, completed the 10,200-mile trip from the Lympne Field, England, to Port Darwin, North Australia, in the record time of 8 days, 20 hours, 44 minutes. For the east-bound trip the flight was about five and a half hours better than that made by C. A. Butler in the fall of 1931. Scott's failure to complete the trip under eight days, as he had planned, was explained by the sandstorms and heavy winds he fought between Bindari and Basra.

The first woman to make the flight across the Australian continent was Miss Irene Dean-Williams. The trip was from Perth, Western Australia to Melbourne, and was made on May 9. The Central Australian desert, which, because of its intense dry heat has caused many other fliers to lose their lives, was crossed by Miss Williams.

The first woman to make a solo flight across the Atlantic ocean and the second person to make such a solo trip, was Mrs. Amelia Earhart Putnam. She had previously crossed the Atlantic by air, in 1928, as a passenger with Wilmer Stultz, as pilot, and Lou Gordon as mechanic, and had been flying for some 10 years, one of the first women to obtain a transport pilot's license. Leaving Harbor Grace, Newfoundland at 7:20 on the evening of May 20, in her Lockheed-Vega monoplane, 13 hours and 45 minutes later she set her machine down in a pasture outside of Londonderry, Ireland. The distance, 2026.5 miles, established a new record for women, and the time was the shortest in which the trip had yet been made. The trip was made on the anniversary of, and five years after, the memorable transatlantic flight of Col. Charles A. Lindbergh. Mrs. Putnam received hearty ovations in Ireland and also in London where she was the guest of the American Ambassador, Mr. Mellon. Upon her return to the United States she received many honors and was the first woman to receive the Distinguished Flying Cross awarded by Congress.

A few hours after Mrs. Putnam started from Newfoundland, the flying boat DO-V began its return flight to Germany. Leaving Newfoundland at 4 a.m., May 21, the big 12-engine plane arrived off the harbor of Horta, Azores at 10:55

p.m., having to taxi the last 7 miles to the harbor because of fuel shortage. The next evening she sailed for Spain, then after a brief stop in England, she arrived at Berlin on May 24.

A new record for passenger-mail planes was established in Australia when the commercial plane carrying the mail and 13 passengers from Perth to Adelaide made the 1450-mile trip in 10 hours.

On June 19, Lieut. Col. Girier and Major Rignot of France left the air field at Le Bourget, Paris, at 9 30 a.m., and without stop made a successful flight of 2980 miles to Teheran, the capital of Persia, in an even 29 hours, arriving at their destination at 2 30 the following afternoon.

In a small low-powered Spanish plane, capable of only 84 miles an hour, Fernando Rein y Loring, a Spanish aviator, left Spain on April 24, having as ultimate destination the city of Manila, Philippine Islands. His trip, of 10,000 miles, frequently interrupted, was notable chiefly because of low speed and power and for the reason that he was the first to make a solo flight from the continent of Asia to the Philippines—Hongkong to Asparri, Northern Luzon—which he reached on July 11.

An eighteen-year-old flier, Robert Buck of New Jersey, who in 1930 set a junior speed record from New York to Los Angeles, established two new junior records in rapid succession this year. On August 10 he flew from the Newark airport to Mexico City, arriving there in 24 hours, 9 minutes; and leaving the Mexican capital three days later in his Pittcairn plane, made the flight to Los Angeles in 20 hours, 35 minutes. Stopping in the western city a week he entered the Bendix Trophy Race of the National Air Races, and finished the twenty-fourth of the 38 entrants who completed the race to Cleveland.

On August 26 Amelia Earhart Putnam, using the same Wasp-powered Lockheed that had carried her across the Atlantic in May, completed a non-stop flight from Los Angeles to the Newark Metropolitan Airport, to become the first woman to make a non-stop transcontinental flight, and bettering by more than 500 miles the previous cross-country distance record for women, held by Miss Ruth Nichols. Mrs. Putnam's elapsed time for the flight was 19 hours, 5 minutes.

Under the description of the National Air Races, on a previous page, an account is given of the remarkably fast flight made by Mr. James G. Haizlip from Los Angeles to Cleveland in 8 hours, 19 minutes, 45 seconds, and to New York in 10 hours, 19 minutes to establish a new transcontinental record.

Not to be outdone by her husband, J. A. Mollison, who in March established a new record for the flight from England to Cape Town, Mrs. Mollison—better known as Amy Johnson—left the Lympne airdrome on Monday morning, November 14 in her Puss Moth, 130-h.p. monoplane to follow his route to the same destination. On Friday afternoon, November 18, she reached Cape Town, a distance of 6200 miles in 4 days, 6 hours, 54 minutes, or 10 hours, 28 minutes, better than that made by her husband. On December 11, the intrepid aviatrix started a return flight to England. Delayed by storms and impenetrable fogs, she was defeated in her aim to reduce the time of her southward flight and required a few minutes more than seven days to reach the Lympne airdrome. Nevertheless, she

reduced by two and a half days the record time established in 1930 by the Duchess of Bedford and Capt. C. D. Barnard.

On November 14, Col. Roscoe Turner established a new east-to-west transcontinental record in the remarkable time of 12 hours, 33 minutes, bettering by two hours, 12 minutes the previous record made in 1930 by Capt. Frank Hawks. Turner left Floyd Bennett field, N. Y., at 7.46 a.m., Eastern Standard Time, and reached Burbank, Calif., at 5.19 p.m., Pacific Standard Time.

**TRANSATLANTIC FLIGHTS** The notable flights of Mrs. Amelia Earhart Putnam and of the *DO-X* across the Atlantic Ocean in May, 1932, are presented on previous pages. Other aviators attempted this crossing, a few ending the flight successfully, but the majority encountering troubles that led to disaster.

On May 13, Louis T. Reichers, having made the flight from the Newark airport to within 47 miles of the southern coast of Ireland, was forced down. His anticipated flight to Paris ended in the total loss of his plane, and he himself, with minor, though painful injuries, was rescued by the *S. S. President Roosevelt*, which continued on its way with him to New York.

On June 11, Stanislaus Felix Hausner, a Polish-American motion-picture operator, was rescued from his floating plane 400 miles north-east of the Azores by a British freighter eight days after the plane had left the Floyd Bennett Field, Brooklyn, with Warsaw as the objective. The condition of the pilot was precarious, through lack of food and water, but by the time the rescuing ship had reached America, he had entirely recovered from the effects of the long exposure.

The first successful east-to-west transatlantic solo flight was made by Capt. James A. Mollison, Scottish aviator, who, taking off from Portmarnock, Ireland on Thursday morning, August 18, arrived at Pennfield Ridge, New Brunswick, at Friday noon, 30 hours and 10 minutes later. Mollison was flying a Puss Moth plane of the same type as that in which he had made his record flight from England to Cape Town in the spring, a tiny machine with a wing spread of 36 ft., 9 in., and a Gipsy III, 4-cylinder, air-cooled, 120-hp motor. To utilize all possible space for fuel storage, the pilot had removed the ordinary seat and handled his controls from a rather cramped position from the floor of the cockpit. The flyer said that at no time did he experience any danger but that he was compelled to travel through a thick fog all night which he found to be very tiring. From New Brunswick he extended his flight to New York and was accorded a hearty welcome. Subsequent plans to return to England by air were canceled upon advice from his physicians who feared that the nervous tension would prove too great. In the east-to-west flight, Captain Mollison established three records in addition to that of the first solo flight. The others were shortest time for a westward crossing; the first transatlantic trip in a light plane, and the longest duration flight in a small plane.

On August 25, Clyde Allen Lee, of Wisconsin, and John Boehkon, a former member of the Norwegian Flying Corps, left Harbor Grace, Newfoundland, with Oslo, Norway as their goal. From the time of its takeoff, the plane was not sighted by any of the number of ships on its pro-

posed course, and the fate of the flyers, who had every confidence in their success, remains unknown.

George Hutchinson, his family of three—wife and two small daughters—and a crew of four, left the Floyd Bennett Field on August 23 in an amphibian Sikorsky plane, *City of Richmond*, en route to London by easy hops. The expedition was well planned, and because of the great experience of the pilot no apprehension was felt as the longest hop from Labrador to Greenland was but 626 miles. The expedition proceeded by schedule but was forced to alight in a storm on the coast of Greenland. The entire party of eight was able to get ashore, after sending an S O S, and within two days was rescued by a British trawler and carried to a Scottish port.

On Tuesday, September 13, William Ullbrich with Dr. Leon Pisculli and Miss Edna Newcomer as passengers, left Floyd Bennett Field with Rome, Italy as their destination. Carrying enough fuel for a flight of 44 hours, the plan was to make no stop until Rome was reached. Although reported 400 miles off the coast of Ireland, the plane was not observed again, and the fate of the flyers is unknown.

Plans for other transatlantic flights were made during the year but were postponed, abandoned, or met with accidents in the early stages. The year ended with but four successful flights: Amelia Earhart Putnam, James A. Mollison, the 12-motored Dornier DO-X, and that of the projected world flight of Griffen and Mattern.

**WORLD FLIGHTS** In an effort to shorten the time of the round-the-world flight set by Post and Gatty, Bennet Griffen and James Mattern in a Lockheed-Vega monoplane with a supercharged Wasp engine left Floyd Bennett Field on July 5, refueled at Harbor Grace, Newfoundland, and reached Berlin on July 6, making a record time across the Atlantic and sighting Ireland 10 hours and 50 minutes after leaving Newfoundland. Stopping in Berlin for only 3 hours and 20 minutes they headed immediately for Moscow, almost 11 hours ahead of the time set by Post and Gatty. Mistaking the lights of Borisov for Moscow, the aviators circled for a landing and landed in a great bog, and the plane cracked up in the soft surface. The damages were too great to permit of emergency repairs, and completion of the flight was necessarily abandoned.

For the third successive year, Capt Wolfgang von Gronau, with three aides, took flight on July 25 from the Isle of Sylt, Germany, to survey a proposed international mail and passenger route. Landing in Iceland, Greenland, and Labrador, he reached Montreal on July 26. He then proceeded to Chicago, Juneau, Alaska, and to Tokyo, where he arrived September 4. The party landed at Shanghai, September 23; but the trip was temporarily halted by an accident over the Indian Ocean, the aviators being rescued by a passing steamer. After repairs were made, the expedition continued via Colombo, Bombay, Bagdad, Athens, and Rome, arriving at Friedrichshafen, Germany on November 9.

**ENDURANCE** Starting on March 23, two French aviators, Lucien Boussoutrol and Emil Rossi, established a new non-stop endurance record. Over a closed circuit at Oran, Algeria, they flew continuously for 76 hours, 43 minutes, and covered a distance of 6025 miles.

**WOMEN'S RECORDS** Amelia Earhart Putnam and Amy Johnson Mollison stood very much in

the forefront among women aviators during the year, the former for her solo transatlantic and speedy transcontinental flights, previously described, and the latter for her record-breaking England to Capt Town flight and return flight. Other women, however, established new records in speed, altitude, and duration.

At the National Air Races in Cleveland on September 5, Mrs. May Hailzip, using the plane in which her husband had broken the transcontinental record a few days earlier, attained a straightaway speed of 252 226 m p h. This was faster by 41.5 miles than the previous record established in 1930 by Ruth Nichols.

On August 19, the French aviatrix, Maryse Hiltz, climbed to an altitude, recorded by her barograph as 33,456 feet. The former official record for women was held by Ruth Nichols, with an altitude of 28,743 feet.

After 8 days, 4 hours, and 5 minutes of continuous flying, Mrs. Louise Thaden and Mrs. Frances Marsalis, descended in their Curtiss Thrush monoplane on August 22 at the Curtiss-Wright Airport, Long Island, having established a new endurance record for women. The former record, established by Miss Bobby Trout and Miss Edna May Cooper, at Los Angeles, was exceeded by more than 73 hours. In the course of the flight contact was made 77 times with the refueling plane.

**AIRWAYS IN THE UNITED STATES** According to the Aeronautics Branch of the U S Department of Commerce, at the end of the year 1932 there were in operation 48,530 miles of airways, as against 50,339 miles at the close of 1931. Mail airways amounted to 45,436 in 1932, as against 43,735 in 1931. The total average of airplane-miles schedules per day was 144,042 miles (158,378 in 1931), in which U S mail was carried an average of 111,849 miles per day (107,705 in 1931), and express an average of 125,922 miles per day.

The number of air transport services in operation in the United States on Dec. 1, 1932, with 1931 numbers in parentheses, were as follows: Domestic routes, 117 (111); mail, 76 (66); passenger, 101 (94); express, 96 (63). Foreign routes, 19 (17); mail, 15 (15); passenger, 18 (11); express, 16 (7). All routes, 136 (111); mail, 91 (79); passenger, 119 (94); express, 112 (70). There were 37 scheduled air-transport operating companies in the country at the close of the year, a net reduction of one, of whom 30 were engaged solely in domestic operation, six solely in foreign, and one in both domestic and foreign operation.

A comparison of the first nine months of operation for the year 1932 with the same period of the preceding year shows an increase in the total amount of express from 683,845 lbs to 1,019,973 lbs., an increase of almost 50 per cent. In the same period the passenger miles flown increased from 89,928,195 to 107,840,869, an increase of 20 per cent. Reduced fares to approximately 6.2 cents per mile, decreases in flying time, coordination of schedules, and improvements in ground connections, all aided in the increase of the number of passengers.

In the first 10 months of the year 1932 a total of 420,719 passengers on the air lines of the continental United States had been carried, as against 469,981 for the 12 months of the preceding year. The average length of trip increased from 250 miles in the first six months of the

year to 279 miles in the next four, and from an average of 230 miles in the year 1931. The air lines of the United States, including those operating in foreign countries, carried a total of 522,345 passengers in 1931 (417,505 in 1930), and flew 47,385,987 miles (30,945,203 in 1930). Express shipments for 1931 totaled 1,151,348 lbs. (468,571 in 1930).

The total number of airports and landing fields in the United States increased from 1870 at the end of June, 1931, to 2037 at the end of June, 1932, according to the annual report of Clarence M. Young, assistant secretary for Aeronautics, U. S. Department of Commerce. Commercial airports increased in number from 601 to 610, while municipal airports decreased from 577 to 543 in the same period.

**AIR MAIL IN THE UNITED STATES.** Notwithstanding a reduction of mail volume, generally, there was an increase of 266,545 pounds in the air mail carried during the fiscal year ending June 30, 1932, according to the annual report of the Postmaster General. During the year 32,202,170 miles were flown with mail out of a scheduled mileage of 34,509,483, the difference representing the mileage of flights abandoned on account of bad weather which rendered transportation by air unsafe to the mail and dangerous to the pilot and passengers. Approximately 60 per cent of the air mail service was on night schedules. On June 30 there were 26,745 miles of air mail routes, an increase of 3257 miles during the year. The average cost per mile for transportation the past year was approximately 62 cents as against 79 cents for the fiscal year 1931. The completion of a lighted airway between Richmond, Va., and Jacksonville, Fla., made it possible to rearrange the service via those points between New York, N. Y., and Miami, Fla., whereby air mail leaving New York at 4 p. m. is due at Miami the next morning at 5 50 a. m., making immediate connection with the planes at Miami for Central and South America. Changes in schedules have been made on all routes offering an attractive fast mail service between the coasts and on connecting lines north and south bound. Practically all mail planes are now equipped with radio and complete flying instruments, have passenger-carrying space, and give fast service with all available safeguards to mail, pilot, and passengers. The service inaugurated about 14 years ago over an experimental route 200 miles long is now a network comprising the largest, safest, and most efficient system of airways in the world. The miles of service scheduled in each year since 1926, the miles actually flown, the weight of mail dispatched, and the amount paid to the carriers are shown in the accompanying table.

creasing popularity. The service included twelve routes, with a total scheduled annual flight of 3,794,855 miles, and included the following routes: (1) New York to Montreal; (2) Seattle to Victoria; (3) New Orleans to Pilotstown; (4) Miami to Havana; (5) Miami to Cristobal, via Central America and direct; (6) Miami to San Juan; (7) Miami to Nassau; (8) Brownsville to Mexico City and thence to San Salvador; (9) Cristobal to Montevideo; (10) Paramaribo to Buenos Aires; (12) Bangor to Halifax.

**BRITISH AIRWAYS.** The British Air Mail Service during 1932 carried a total of 6,348,720 letters. Imperial Airways, the largest of the operating companies, reported that for the six months ending September 30, that line had carried 37,465 passengers, or over 7000 more than for the entire year ending March 31. On January 20, the company inaugurated a regular air mail service between England and Cape Town, South Africa. The fleet of the company was increased to 40 aeroplanes by the addition of 8 *Atalantas* specially designed for service on the African route. The *Heracles* and *Hannibal* classes operated by the Company are the largest aircraft in the world for use in civil transport, providing accommodation for 38 and 22 passengers respectively.

**CANADA.** In the first 10 months of the year there was an increase of 41 private pilot licenses in force in Canada, and 51 commercial pilot licenses, making a total of 333 private pilots and 420 commercial pilots. Licensed airports increased to 91 as against 78 at the beginning of the year. By the middle of the year there were 8 air mail services in operation, chiefly in remote portions of the Dominion. The total of mail carried in the first six months was 227,839 lbs.

**GERMANY.** In miles flown and in total number of passengers carried, the German air lines greatly surpassed the performance of any other European country in 1931, although in both fields the air lines of the United States showed far larger totals. Passengers carried by German lines numbered 98,467, and the miles flown were 6,387,495. In goods carried, the German lines surpassed those of any nation with a total of 2175 tons; the United States lines were a poor sixth with a total of 575 tons. Total figures for 1932 are not available; but scattered reports of several lines indicate that, although miles flown may be but slightly increased, an increase of 5 to 10 per cent in passengers and tonnage will be shown. The Luft Hansa lines reach 26 large foreign cities, connecting them with 35 important German cities, traveling more than 19,000 miles daily. It operates 40 regular passenger lines and in addition has four mail and express

Fiscal year	Length of routes, miles	Miles of Service		Total wgt of mail dispatched, pounds	Amount paid carriers
		Scheduled	Actually flown		
1926 .. . . .	3,597	411,070	396,345	3,000	\$89,753 71
1927 .. . . .	5,551	3,092,016	2,805,781	473,102	1,363,227 82
1928 .. . . .	10,932	5,999,948	5,585,224	1,861,800	4,042,777 16
1929 .. . . .	14,406	11,032,508	10,212,511	5,635,680	11,169,015 13
1930 .. . . .	14,907	16,228,453	14,939,468	7,719,698	14,618,231.50
1931 .. . . .	23,488	22,907,169	21,381,852	8,579,422	16,943,605.56

International air mail routes emanating from the United States functioned at almost 100 per cent during the fiscal year, and showed an in-

lines to England, Holland, Scandinavia, and the Balkans.

operations, French air lines covered a total of 5,759,018 miles in 1931, carrying 32,700 passengers and 1508 tons of goods. The air routes traversed by these lines totaled 21,152 miles, including lines in Africa, Asia, and South America. French lines have devoted less attention to an increase in passenger service, but have concentrated their interest into the transportation of merchandise. One company is reported to have increased its business in that direction to a remarkable extent with a total volume in 1932 of more than 2500 tons.

See LIGHTHOUSES under *Airways Facilities*; MILITARY PROGRESS under *Great Britain*.

**BIBLIOGRAPHY.** Among the important books that have been announced or published during the year may be mentioned the following: *Handbook of Aeronautics* (London), edited by C. G. Burge, Capt J. L. Pritchard, and Lt. Col. W. Lockwood Marsh, *Pilot's Handbook* (Los Angeles), J. D. Haddon, *An Introduction to Aeronautical Engineering*, vol. ii (London); J. L. Nayler and E. Owei, *Aviation of To-day* (London); *Naval Air Pilot*, Navy Department, Washington, D. C.; Howard C. Stark, *Blind or Instrument Flying?* (Newark, N. J.); John G. Younger, *Airplane Construction and Repair* (New York); P. C. Giese, *The Problem of Vertical Flight* (McComb, Ohio); F. D. Bradbrooke, *The Light Aeroplane Manual* (London); *Jane's All the World's Aircraft, 1931*, edited by C. G. Grey and Leonard Bridgeman (London); Edward P. Warner and S. Paul Johnston, *The Aviation Handbook* (New York); *United States Aviation Reports, 1931*, edited by Arnold W. Knauth, Henry G. Hotchkiss, and Emory H. Niles (Baltimore); Lt. Com. Charles E. Rosendahl, *Upship!* (New York); Thomas L. Bulger, *Model Builders' Manual and Junior Aeronautical Engineering*, (New York), *The Aircraft Yearbook for 1932*, compiled by The Aeronautical Chamber of Commerce (New York); C. H. Chatfield and C. F. Taylor, *The Airplane and Its Engine* (New York), *Handbook of the British Glider Association* (London); C. D. Barnard, *Barnard on Learning to Fly* (New York); Elliott G. Reid, *Applied Wing Theory* (New York); Assen Jordanoff, *Flying and How to Do It* (New York); E. A. Stalker, *Principles of Flight* (New York); Wm. Marshall Freeman, *Air and Aviation Law* (New York); T. von Buttlar Brandenfels, *Zeppelin over England* (New York); Emile Allard, *Cours d'Aéronautique* (Paris); Wilh. Hoff, *Jahrbuch (1931) der Deutschen Versuchsanstalt für Luftfahrt* (Berlin); Elvin S. Ferry, *Applied Gyrodynamics* (New York); Sterling R. Wagner, *The Modern Airport* (Syracuse University); Carl Pirath, *Die Luftverkehrswirtschaft in Europa und in den Vereinigten Staaten* (Berlin); P. M. Heldt, *High-Speed Diesel Engines* (Philadelphia); Charles Taus, *Stabilité et Maniabilité des Avions* (Paris); R. E. Root, *Dynamics of Engine and Shaft* (New York); M. Henri Villat, *Mécanique des Fluides* (Paris); Max von Beyer-Desmon, *Flughafenanlagen* (Berlin); *Ergebnisse der Aerodynamischen Versuchsanstalt zu Göttingen* (Munich), edited by L. Prandtl and A. Betz; Ray A. Dunn, *Aviation and Life Insurance* (New York); Laura B. Harney, *The Skyraaft Book* (New York); M. Langley, *Metal Aircraft Construction* (London); H. F. Lusk, *A General Text on Aeronautics* (New York); Ross Mahachek, *Airplane Pilot's Manual* (New York); E. John

Moors, *Aircraft Engine Mechanics Manual* (New York); H. A. C.

#### AEROPLANES. See AERONAUTICS.

**AFGHANISTAN**, af-gān'-is-tān'. An independent kingdom of central Asia, serving as a buffer state between India and the Soviet Union. The estimates of the area vary from 245,000 to 270,000 square miles, while the population is roughly estimated at about 11,000,000. King in 1932, Muhammed Nadir Shah, who was called to the throne Oct. 16, 1929. Capital, Kabul, with a population of about 80,000.

Other important towns are Kandahar (60,000), Herat (30,000), and Mazari-i-Sharif (46,200). The Afghan is the dominant race and the chief tribes are the Durans and the Ghilzais, numbering about 2,200,000. There were about 70 Europeans in the country in 1931. The prevailing languages are Persian and Pushtoo and the dominant religion is Islam. Free elementary and secondary schools exist in various parts of the country.

**PRODUCTION, ETC.** The largely mountainous country contains a number of fertile plains and valleys where irrigated crops of cereals, fruits, and vegetables are raised. Pears, apples, almonds, peaches, quinces, apricots, plums, pomegranates, grapes, figs, and cherries constitute a staple food of the population and much preserved fruit is exported. The native fat-tailed sheep is the principal domestic animal. Native industries, chiefly of the cottage type, supply the local demand for cloth, soap, boots, and other articles; carpets and rugs are woven for export. Army supplies are made at a state-owned factory in Kabul. Copper, lead, iron, coal, lapis lazuli, and some gold are found, the first named in large quantities. There is little mining activity, however. Afghanistan's trade with India averages about \$15,000,000 annually in normal times. The principal exports are wool, silk, cattle, hides, tobacco, timber, fruits, and vegetables, cereals, safflower and other drugs, and spices. Imports in 1931 came chiefly from the Soviet Union. Cotton goods, sugar, leather, hardware, and silver treasure are the chief imports from India.

The annual revenue is variously estimated at from \$5,000,000 to \$20,000,000. The two leading trade routes to India are from Kabul to Peshawar by way of the Khyber Pass and from Kanda-

har, centre of a rich fruit-growing region, to the railway terminal at Chaman, India. There are no railways in Afghanistan and transport is by caravan or by motor over the rough roads connecting Kabul with the chief cities. A 40-year contract for the establishment of air lines from Herat to Kandahar and Kabul, with branch lines to the northwest frontier of India, was obtained by the Junkers company of Germany in 1931. A Soviet weekly air service connected Kabul with Termez in Soviet Central Asia.

**HISTORY.** The new Constitution promulgated by Nadir Shah and made public in the outside world in 1932 provided for an independent constitutional monarchy, with Islam as the state religion. It contained a bill of rights, made primary education compulsory, and forbade slavery and forced labor or the confiscation of personal property, except that of refugees from the country. Provision was made for a Council of State, composed of representatives elected for three years, and for a Chamber of Nobles appointed by the King. Legislation was to be initiated by the Ministers, passed by the Council of State, approved by the Chamber of Nobles, and signed by the King. A revolt of the Darakhel section of the Zadran tribe was reported in November, 1932.

**AFRICA.** The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including ETHIOPIA, KENYA; EGYPT; MOROCCO; TUNIS; SOUTH AFRICA; UNION OF, etc. See also the articles ANTHROPOLOGY, ARCHEOLOGY; PHILOLOGY, MODERN; and EXPLORATION.

**AFRICAN LANGUAGES.** See PHILOLOGY, MODERN.

**AGNES SCOTT COLLEGE.** An institution for the higher education of women in Decatur (Atlanta), Georgia. The enrollment for 1932-33 was 475. The faculty numbered 48 members, and the officers of administration, 15. The endowment was \$1,257,000, and the gross income for the year was approximately \$333,000. There were 26,500 volumes in the library. During 1932 there has been steady progress made on collecting funds for the carrying out of a development programme of \$1,500,000. President, James Ross McCain, Ph.D., LL.D.

**AGRICULTURAL EXPERIMENT STATIONS.** Experiment stations, the research institutions of agriculture, were in active operation in all of the States of the United States, and in the territories and insular possessions. Of the available funds for their support, totaling approximately \$17,500,000, the Federal government supplied \$4,587,030, which included \$90,000 for each State, \$15,000 for Alaska, and \$22,000 for Hawaii. The remainder, coming from State appropriations, allotments, sales, and fees, shows that as heretofore, the Federal funds were supplemented liberally. Funds for the support of experiment stations maintained by the U. S. Department of Agriculture in Alaska, Hawaii, Puerto Rico, Guam, and Virgin Islands aggregated \$230,030.

The magnitude of this system of agricultural research was evident in the number of research projects aggregating nearly 7000, of which 436 projects received support from the Adams fund and 1458 from the Purnell fund. Approximately 1100 of the total were in cooperation with the U. S. Department of Agriculture covering national, regional, and special problems. Curtail-

ment of funds and other reasons led to a considerable revision of research projects and programmes by the stations. Recent contributions to agriculture by the State stations dealt with problems of soil fertility, of farm management, of animal and plant disease control and insect control, of distribution and marketing, of quality improvement, of harvesting methods, of processing and storing, of utilizing surpluses and by-products, and of farm living standards.

During the year, the U. S. Department of Agriculture discontinued operation of the stations in Alaska, Guam, and the Virgin Islands which had been under its control. In Alaska the work was to be continued as part of the Alaska Agricultural College and School of Mines. The Virgin Islands station was transferred to the Department of the Interior, and the Guam station was transferred to the insular government for use as an agricultural school. Steps were taken to coordinate the various agricultural research and extension activities in Puerto Rico, in somewhat the same way as had already been done in Hawaii.

Improved facilities for research in the form of buildings and land were provided by the several States and others were authorized. New buildings erected in 1932 included the Jenkins laboratory at the Connecticut State Station, a dairy building at the Pennsylvania Station, a poultry plant at the Arkansas Station, a home economics building at the Georgia College, an agronomy building at the Wisconsin Station, horticultural laboratories at the New York State and South Carolina Stations, and a crops field house at the Minnesota Station. The Nebraska Station was erecting a new seed house and crops laboratory. The James Turner Research Institute, the North Jersey Branch of the New Jersey Stations, completed the construction of modern barns, a hay dehydrator, and silos. The current research programme of the institute included pasture management studies, nutrition, breeding, and the control of diseases and parasites of dairy animals.

Important local problems and special crops were responsible for the establishment of several new substations and experimental fields. In South Carolina, a new substation was established in Charleston County for experiments with vegetables, and the Coast Substation was converted into a livestock and forestry station. Experimental fields were established in southeastern Kansas for crop production studies on three major soil types, and in northeastern Kansas for study of orchard problems, small fruit, potatoes, and general field crops on the glacial soil. W. K. Kellogg of Battle Creek, Mich., presented to the University of California, a ranch of 750 acres near Pomona, with a stud of 87 Arabian horses and an endowment of \$600,000 under an agreement to establish the W. K. Kellogg Institute of Animal Husbandry, as a part of the division of animal husbandry, and devoted to the breeding and improvement of the Arab horse. He supplemented previous gifts to the Michigan College and Station with a tract of 360 acres of abandoned farm land for reforestation demonstrations. A 2082-acre tract in Hernando County, Florida, was deeded by the owners, Col. and Mrs. Raymond Robbins, to the Department of Agriculture for use as a bird refuge, and also, in cooperation with the Florida Station, in studies of problems relating to citrus

fruits, livestock, and feed and forage. The Wisconsin Station, cooperating with the U. S. Department of Agriculture, established a soil erosion experimental farm near LaCrosse.

The Massachusetts, Ohio, and New York State Experiment Stations celebrated their fiftieth anniversaries during the year. Changes occurred in the directorships of the Alaska, Colorado, Guam, Iowa, Mississippi, New York Cornell, and Virginia Truck Stations. Director C. F. Curtiss, associated with the Iowa Station since 1892, and H. C. Henriksen, Agriculturist of the Puerto Rico Station, retired during the year. C. P. Gillette retired as director of the Colorado Station. In Canada, Joseph H. Grisdale, deputy minister of agriculture since 1919 and previously a pioneer agriculturist and director of the Dominion Experimental Farms, retired March 9.

**BRITISH EMPIRE** The Empire Marketing Board continued to promote agricultural research throughout the British Empire, expending £335,000 in the year ended May, 1932 on numerous projects in cooperation with different institutions, with supplementary funds from local contributions often equaling the imperial grants. Substantial reductions were effected in almost all of the Board's research liabilities, provisional grants were suspended, and few new grants were made, although the Board continued to cooperate with existing research organizations in planning joint programmes of research on a broad empire basis. Research enterprises currently proceeding under substantial allotments included cold storage research in Great Britain and Trinidad; fruit studies in New Zealand, Trinidad, Sierra Leone, and Great Britain, plant breeding work in Wales, Irish Free State, New Zealand, and Australia, plant disease control and economic investigations in the British Isles, tobacco research in Southern Rhodesia, sugar and pineapples in Mauritius; investigations of the mineral content of pastures in Scotland, Australia, New Zealand, and Southern Rhodesia; entomological work in Australia, New Zealand, and Great Britain; poultry research in Ontario and the British Isles; dairy products research in Scotland and New Zealand; veterinary work in Quebec, Australia, and South Africa, wool studies in Great Britain; and tropical research stations in Trinidad and at Amami, East Africa.

**CANADA** The agricultural colleges of the several Provinces and the Dominion Experiment Farms continued to maintain their high standards of agricultural research. The Institute of Parasitology, a new empire centre for the study of internal parasites of livestock was established at Macdonald College, P. Q., and was to be housed in buildings being erected by the Quebec Government. Financial support for three years was to be provided jointly by the Empire Marketing Board and the National Research Council of Canada. The National Research Laboratories, formally opened at Ottawa on August 10, embrace a division of biology and agriculture directed by Dr. Robert Newton. The twelfth Annual convention of the Canadian Society of Technical Agriculturists, a dominion-wide organization of station and extension workers, was held at Manitoba Agricultural College, Winnipeg, in June, 1932.

**SCOTLAND** The Macaulay Institute for Soil Research, established and endowed by T. B. Macaulay, of Montreal, Canada, at Craigiebuckler, near Aberdeen, Scotland, in 1930, was operating

a peat demonstration farm in the Island of Lewis in the Western Hebrides; was carrying on soil investigations under the directorship of Dr. W. G. Ogg; was cooperating with and taking over certain phases of soils work from the Scottish agricultural colleges, and was collaborating with other research institutions on problems related to soils. The new plant of the West of Scotland Agricultural College at Auchincruive near Ayr, was in operation after its formal opening in 1931 by the Duke and Duchess of York. A tract of 600 acres, presented to the Scottish Government for purposes of education and research, was assigned to the college adjoining the new Hannah Dairy Research Institute. The Dairy School for Scotland formerly at Kilmarnock, was transferred to Auchincruive and reorganized; provision was made also for a poultry school, horticultural, bookkeeping, and plant industry departments, dairy research, and an experiment station, and a number of new buildings were constructed. The Hannah Dairy Institute, formally opened in 1931, at its permanent location at Auchincruive, housed in buildings erected and equipped from a capital grant of £15,000, was carrying on, under the direction of Dr. Norman C. Wright, investigations dealing with the nutrition of ruminants, the physiology of lactation, the breeding of dairy cows, bovine tuberculosis, and the condensing and drying of milk and its by-products.

**PALESTINE.** The Independent Biological Laboratories opened about two years earlier at Tel-Aviv, in 1932 were giving attention to the biology of numerous Palestinian plants and geographical areas, wheat, and the physiology and biology of citrus. Courses of instruction in agriculture and related sciences were also being offered. A school of agriculture to be directed by Dr. Chaim Weizman, was to be established by the Hebrew University and was to cooperate with the experiment station of the Jewish Agency.

**U.S.S.R. (RUSSIA).** The New Bast Fibre Research Institute in Moscow, established in 1931, as a branch of the Lenin Academy of Agricultural Sciences, for the working out of scientific methods for the introduction of new bast fibre plants into the U.S.S.R., and mechanizing the processes of extracting fibres from ramie, kenaf, kenat, flax, hemp, and jute, and headed by A. M. Krasnotchokoff, organized several laboratories, experimental textile plants, and cotton mills at Moscow, experiment stations at Krasnodar, Kuznets, and Tashkent, and over 28 special state farms in Central Asia and the Caucasus.

**NECROLOGY.** Station workers dying during 1932 included T. C. Johnson, director of the Virginia Truck Station, S. T. Fleming, asst. director of the Florida Station, W. P. Headdon, retired chemist of the Colorado Station; George Jansen, asst. agronomist of the Arkansas Station; Frederik Rasmussen, head of the dairy husbandry department, Pennsylvania Station; Anthony Spuler, associate entomologist at the Washington Station; and Robert Wytheombe, superintendent of the Eastern Oregon Substation. Harry Hayward, former director of the Delaware Station, and William A. Henry, retired director and dean of agriculture of the Wisconsin College and Station, also died during the year. Among British agriculturists, Sir William Somerville, professor of agriculture and rural economy at Oxford University from 1906-1926, and a pioneer worker in agricultural science in

Great Britain, died February 7. Sir Horace Plunkett, eminent for his pioneer studies of agricultural cooperation and rural life, and a leader in the agricultural affairs in Ireland, died March 26. Dr. R. Stenhouse Williams, first director of the British National Institute for Dairying and research professor of dairy bacteriology in the University of Reading, died February 2. Prof. K. K. Gedroiz, director of the experiment station of the Scientific Institute of Fertilizers, Moscow, died October 5.

**BIBLIOGRAPHY.** Consult also *Report on the Agricultural Experiment Stations, 1931*, by J. T. Jardine, W. H. Beal, and H. M. Steece, (U. S. Department of Agriculture); *Report of the Chief of the Office of Experiment Stations, 1932*, by J. T. Jardine, (U. S. Department of Agriculture); *New Jersey Agricultural Experiment Station, 1880-1930*, by C. R. Woodward and I. N. Waller, (New Brunswick, N. J., 1932); *Empire Marketing Board: (Report), May, 1931 to May, 1932* (London, 1932).

### AGRICULTURAL EXTENSION WORK.

The major problems faced by farm families during 1932 were reducing their expenditures on the one hand, augmenting their income on the other, and maintaining at the same time adequate standards of living. To these problems, the Extension Service gave its principal attention during the year. The general depression, marked reduction in consumption of many agricultural commodities together with surpluses of some of these commodities, and other factors, made it necessary for farm families to develop and use sources of income which they had not previously used. Supplemental and alternative lines of production had to be considered and decided upon. There were many factors for farm people to consider, or much need for careful study of the situation in which the individual farmer found himself.

In seeking to meet their various situations, farm people made urgent demands on the United States Department of Agriculture and the State Agricultural colleges for reliable and practical information bearing on production, marketing, and home making. The Extension Service brought to them the facts best adapted to their particular needs. The farm organizations cooperated with extension agents in making these facts available and in putting them to wide practical use. The farm organizations made it their business to carry through the extension programmes in their counties to a successful conclusion. As individuals their members served as local leaders, demonstrators, and cooperators in bringing to the attention of their friends and neighbors the information they have obtained through their county extension agents. Without the aid of these farm organizations and of other organized groups the Extension Service would have fallen far short of its opportunities for being of service to farm people during 1932.

The wide usefulness of the Extension Service during the year was shown by the number of farmers and farm women throughout the country who made the extension programme their own and who voluntarily gave their time and effort to carrying out this programme in their communities. More than 150,000 men and 128,000 women served as volunteer local leaders in extension work among their neighbors. Over a million demonstrations were carried out by men and women interested in improving their meth-

ods of production, management, marketing, and home making.

Supplementing its work with adults, the Extension Service gave more than 900,000 farm boys and girls opportunities for self-advancement and self-expression through membership in 4-H clubs. These 4-H clubs are clubs for farm boys and girls in which they are given instruction and practice in methods of farming and home making. The boys, as a rule, grow an acre of corn or cotton, raise a pig, calf, or sheep, or engage in some other line of agricultural production. The girls engage in such activities as the growing of vegetables, the canning of vegetables and fruits, the making of dresses and other clothing, refinishing of furniture, and the beautifying of the grounds around the home. The term 4-H used to designate these clubs signified the four things which are developed by boys and girls in this extension activity; namely, the head, hands, heart, and health. The idea of the 4-H club developed in a number of forms in the period from 1900 to 1910, although the designation, 4-H, was first associated with the development of these clubs for both boys and girls in the Southern States as a part of the demonstration work developed in that section in the effort to overcome the inroads made by the boll-weevil in cotton-producing areas. In 1932, these boys and girls learned not only to take their part in the ranks of agriculture but contributed in no little measure to the production, income, and economy of the farms on which they lived. This work, too, was reinforced by the assistance of some 70,000 men and women and, in addition, 30,000 older boys and girls who voluntarily gave their time and effort to encouraging and carrying on some 70,000 local 4-H clubs.

Information on which extension programmes were developed in the counties came from studies of the counties themselves. The facts required were obtained either through formal surveys or through the meetings of leading local people who reported on county and community conditions and needs. These programme-planning meetings had as their economic background the farm and home surveys, the farm and home accounts which had been summarized to show receipts and expenditures, and data on production and on management methods in farm homes. Outstanding farmers and farm home makers made observations on local conditions and discussed these conditions at the county meetings. Food and feed needs of a county often were determined by using the United States per capita consumption as a basis, or a per capita or family-and-farm need budget developed by the State. Several States drew up forms to serve as bases in helping to determine food-and-feed budgets. During the year conferences of this type were held in every part of the United States.

Economic data on the world, the nation, the State, the county, and even the individual farm, are not completely informative without facts about the various enterprises which constitute a programme for an individual farm. Individual farm records provided fundamental information on which to base adjustments in farm business. Many thousand farmers cooperated with county extension agents in keeping detailed accounts of their receipts and expenditures and the changes in their inventories. Records of costs and returns from different activities on single farms or on

groups of farms, also, were kept. The information contained in these accounts and records was summarized and analyzed and its application was discussed by local groups. How many sprayings could profitably be applied to orchards or potato fields, how much fertilizer or how much feed could profitably be used, the efficient size of a production unit, how labor could be used to greatest advantage, and similar facts.

With less cash to spend in maintaining their households, farm women showed keen interest in keeping strict account of the use of their incomes. The results of the analyses of such accounts were tabulated according to the size of the incomes as well as the size of the families. Analysis meetings held at the end of the year helped the farm people to check their expenditures against the averages of other families under similar conditions. Deductions about changes they might incorporate in the next year's farming and living programme to bring about a wiser use of the family income were made by these account keepers in consultation with their extension agents.

It is necessary under present conditions that the farm be organized and operated to produce with the smallest expenditures of money, time, and effort per unit. In accomplishing this result in 1932, farmers utilized with advantage information provided by extension agents bearing on the use of efficient methods in growing crops and livestock, the prevention of loss and waste from diseases and pests, the use of improved seed and the best cultural methods. The unusual demands of the situation brought several crops into prominence because of their adaptation to certain new requirements, and with the assistance of extension workers, farmers introduced and developed many cash or maintenance crops new to their counties.

Not only were changes in lines of production undertaken by farmers during the past year but they made many adjustments to more economical farm practices as well. This was particularly true of the use of farm labor, power, and machinery. The year witnessed a marked spread of the use of big hitches enabling farmers to use horses effectively in operating gang plows and other machinery hitherto largely drawn by tractors. This, in turn, reduced operation costs since the horses were being maintained largely on feeds grown on the farm itself. Terracing and the building of soil-saving dams were important activities on many farms. Including the estimated acreage terraced during the year, approximately 15,000,000 acres have been terraced in accord with extension recommendations in the past ten-year period. Extension agents stressed the importance of putting all existing buildings in good condition and repair. They supplied information concerning the installation of water-supply, sewage-disposal, and lighting and heating systems, and for the planning, construction, and remodeling of farm homes in every State. Rural electrification, also, was an important phase of farm-home improvement undertaken.

In dealing with plant-disease problems, growers, particularly those specializing in intensive crops, gave more than their usual attention to cutting production costs and improving quality by suppressing plant diseases. Extension workers stressed the economies effected by controlling plant diseases, and at the same time sought to

evolve the lowest-cost methods consistent with safety.

Farmers were aided in improving such marketing processes as packing, grading, and standardizing commodities, and in reducing losses in marketing channels, warehousing, and storage. Extension workers kept farmers informed on probable market demands in order to enable them to adjust their production programmes and to know when to sell. They helped officers and managers of cooperative associations in educational campaigns to teach the members and the public about the activities of particular marketing organizations and of the whole cooperative marketing movement. The volume of business done by organized groups of farm people in 1931 with whom extension workers cooperated totaled \$350,000,000. The amount of business done in 1932, in spite of lower prices, was estimated as being considerably in excess of this amount.

Farm women in many localities sought earnestly to develop supplemental sources of income to make up the deficiencies of the income from the regular operations of the farm. Boys and girls, also, took up various activities to bring in a little money. There was a great demand for information on some of the old-fashioned home arts and crafts and timely thrift measures. Extension workers encouraged the standardization of articles made for sale and the women recognized the value of such standardization. The activities of 4-H club members during the year frequently enabled them to give definite financial aid to the household. A fat baby beef, three or four sheep, the products of a garden, home-canned fruits and vegetables, clothing and furnishings remodeled or manufactured from inexpensive material, contributed to increasing the family income or to reducing its expenses.

The Extension Service assisted farmers during the past year in the credit field. The importance of making annual farm inventories, filing credit statements at banks, and endeavoring to use bank credit instead of store credit, was stressed by extension agents. A striking instance of activity in this field was the cooperative work done with the bankers of Georgia in a directed agricultural credit movement. In 117 of the 160 counties in the State, agricultural programmes were adopted by the farmers of the county at mass meetings. The bankers then printed and distributed copies of the programme and announced to the farmers that they would lend money on that basis only.

Farm families during 1932 sought in every possible way to reduce their expenditures. Farm women set the example of thrift by making bread, canning and drying fruits and vegetables, curing meats, making soap, laundering and dry cleaning clothes, and remodeling coats and dresses. The year was marked by the unprecedented activity in the planned production of home-grown foods. In every State the poultry flock and the home dairy were developed to the utmost to meet nutritional needs. Many extension agents found on the farms of their counties a surplus of milk or an excess of beef that could hardly be sold at any price. They put on culling campaigns along with butchering demonstrations. This encouraged not only the price of the animals but also of the products left on their farms, and served to lower the cost of living on the farm. Thousands of home makers, handicapped by reduced incomes,

were supplied with suggestions on the more economical clothing of the farm family. Demonstrations and exhibits were staged in coat making; women were taught to make garments from flour, feed, and sugar sacks; sewing machine clinics were held; and "use cotton" campaigns were staged.

Attractive surroundings, good health, wholesome recreation, social contact with neighbors, and better family relationships appeared to count for much more in 1932 in rural communities than in more prosperous times. Much was accomplished in the way of inexpensive improvement and beautification of the home and the grounds with little or no cash outlay. Home makers refinished and reupholstered furniture, made rugs, curtains, and draperies out of inexpensive materials, and brought to light many artistic pieces of furniture that had been stored and forgotten in attics. Grounds and yards, as well as the interiors of houses, were improved and beautified. Local woods, cuttings from the gardens of friends, and plant exchanges among the home demonstration club members were the principal sources of material for beautification. Many States reported the planting of shrubs and shade trees, the repairing of buildings, the removal of rubbish, and other work that added to the appearance of home surroundings at slight cost.

Recreation at little cost was a real factor in maintaining morale in several communities during the year. The Extension Service cooperated systematically with the National Recreation Association (q.v.), and with other agencies, in developing leaders in recreation and amateur dramatics in rural communities who organized and carried out suitable recreation programmes. Extension workers redoubled their efforts to help farm families maintain their health standards. Recommendations on properly balanced and adequate diets and menus available from the products of the farm or at the lowest possible cost for purchased food have been worked out and supplied to farm home makers. Special attention has been given to the use of foods locally plentiful, such as wheat, sorghum, potatoes, beans, apples, and peaches.

Depression, unemployment, drought, and the ravages of insect pests have brought dire want and suffering to many farm families in the past few years. Wherever the National or State governments attempted to meet existing problems of unemployment, or relieve the distressed in rural districts in 1932, the county extension agents usually assisted in the execution of these plans. They aided local committees materially in the efforts of the Reconstruction Finance Corporation (q.v. UNITED STATES) to make needed credit available to farmers in areas where because of crop failures or economic conditions refinancing of the farm business became imperative.

Organizations of farmers and farm women were active throughout the country in relieving distress and destitution in their communities. Extension agents worked with them in cooperating with county governing bodies and local relief organizations in bringing systematic and efficient aid to those in need of food, clothing, and shelter. Throughout the country, extension agents encouraged rural women to donate excess food supplies for the use of needy neighbors and for canning, to use in rural schools, in order to assure one hot dish for rural children at their noon meal during the winter.

The field force employed to carry on extension work on June 30, 1932, totaled 5977 persons, 202 fewer than last year. Engaged in agricultural work in the counties were 2312 county agents, 222 assistant agents, and 174 negro agents. The home-economics staff included 1176 county home-demonstration agents, 35 assistant agents, 10 urban agents, and 127 negro agents. One hundred and eighty-six county club agents and 35 assistants devoted full time to 4-H clubs, while practically all county extension agents gave a substantial part of their time to boys' and girls' club members. To reinforce the efforts of county extension agents, and to assist with more highly specialized problems, there were 1178 extension specialists, most of them stationed at the State agricultural colleges. The administrative and supervisory staff in the States numbered 504.

The total funds allotted for cooperative extension work in the States and Territories during the fiscal year 1932-33 amounted to \$23,405,000; a reduction of about two million dollars, or 8 per cent from the amount available during the previous year. Of the total funds allotted \$9,653,000 is from Federal sources, and \$13,752,000 from sources within the States and Territories. The reduction in Federal funds amounted to \$63,000 while funds available from sources within the States were reduced by about \$1,930,000.

Exact figures on extension results for 1932 were not available when the statement was prepared, but in every extension activity a greater volume of results was indicated as compared with the previous year. The figures for 1931 show that 1,057,489 demonstrations in improved methods of farming and home making were conducted by farmers and farm women with the assistance of extension agents. The number of demonstrations carried on by boys and girls in the 4-H clubs was even larger, being 1,114,065. Supplementing contacts made with farm families through these demonstrations, extension workers made many farm and home visits, held meetings, supplied news items to the local press, gave radio talks, sent out circular letters, displayed exhibits, conducted tours, and used every possible means of bringing extension information to public attention. The number of meetings held to demonstrate improved methods was 461,793, with a total attendance of 7,988,587 people. There were 960,550 farms and 363,019 homes visited by extension agents to enable them to discuss their individual problems at first hand with farmers and farm women. These figures afford some indication of the variety of ways in which the Extension Service was brought in touch with farm people and was enabled to serve them.

**BIBLIOGRAPHY.** Consult *Report of Extension Work in Agriculture and Home Economics in the United States, 1931*, issued by U. S. Department of Agriculture; *History of Agricultural Extension Work, 1785-1923*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 15, 1928), *History of Agricultural Education, 1785-1925*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 36, 1929).

**AGRICULTURE.** The year 1932 in American agriculture was characterized by unprecedented low price levels for all classes of farm commodities, diminished incomes, increasing debts, and tax burdens that were heavier to carry. Crop production was fairly stable, and there was no calamitous drought, or insect infesta-

tions or other plagues of serious magnitude. This general situation in agriculture was not confined to the United States, its scope was world-wide.

The influences largely responsible for the prevailing extremely low levels of prices and farm income were, in the opinion of the Federal Farm Board, the inability of our domestic consumers to buy, because of reduced incomes and widespread unemployment; and the inability of foreign customers to purchase American products to the usual extent, due to disorganization of international trade, and the accompanying heavy unemployment and reduced incomes abroad.

**FARM RELIEF.** The distress of the agricultural industry and the farmers naturally was a paramount issue in the 1932 presidential campaign, and probably was an important factor in the outcome of the election. Both major parties considered it as the most urgent economic problem of the country and included programmes for relief in their platforms. President Hoover in his acceptance speech in Washington, August 11, referred to the dependency of the farmer upon tariff protection for recovery, the many measures of emergency relief enacted for agriculture, the progress of the Farm Board in furthering the cooperative movement, and its experience in stabilization. He opposed the extension of governmental agencies to control the farmers' production and to provide subsidies. He voiced the opinion that "The most practical relief to the farmer to-day aside from the general economic recovery is a definite programme of readjustment and coordination of national, State, and local taxation which will relieve real property, especially the farms, from unfair burdens of taxation which the current readjustment in values has brought about."

Governor Franklin D. Roosevelt, the president-elect, in a speech at Topeka, Kan., Sept. 14, 1932, declared "The situation challenges every responsible statesman in America to seek in agricultural circles an active remedial plan." In his programme for agricultural equality with industry, he proposed for immediate relief, the refinancing of farm mortgages with lower rates and longer time for payment, the restoration of world trade by tariff reform and tariff agreements with other nations, and the raising of domestic prices of surplus crops. As a permanent programme, he favored putting into effect a national land planning policy, the reduction and equalization of land taxes, and the reorganization of the U. S. Department of Agriculture to eliminate waste and make its work more effective.

Among the many proposals for farm relief, brought forward to cope with the agricultural situation, the voluntary domestic allotment plan, a measure having the support of leading farm organizations and opposition in various other quarters, was regarded as most influential. The proposal, as described by the Food Research Institute of Stanford University, was evolved to meet the demand that farmers producing export-surplus crops and livestock be assured, on the portion consumed in this country, the equivalent of effective tariff protection. It called for distributing a bonus or tariff benefit among producers on the basis of their past production, and deriving the necessary funds from excise taxes levied on processors. It contemplated a decentralized procedure for making allotments to individual farmers, whose claim to determined benefit would rest upon voluntary signature and ful-

fillment of contracts to restrict acreage (or production) as the Federal administrative agency might prescribe. The domestic allotment plan was said to be embodied in a bill before Congress at the close of the year. The bill provided that adjustment certificates be issued to farmers willing in 1933 to reduce their acreages of wheat, cotton, or tobacco 20 per cent, or their tonnage of hogs to the same extent. Certificates would entitle holders to receive, on that percentage of the total crop consumed in the United States, cash payments enough to bring prices up to their average pre-war level for the years 1909 to 1914. Funds with which to make these payments would be raised through a tax imposed on millers, packers, and other processors of the products specified.

The farm relief movement during 1932 was also featured by a farm strike in the late summer in usually conservative middle-western States in efforts to bring higher prices for farm products. The governors or their agents from nine midwestern States, meeting in Sioux City, Iowa, in September during the strike declared themselves in favor of tariff revision, sound currency expansion, moratoriums on farmer debts, and an orderly marketing programme in recommendations addressed to the President and Congress. They denied the demands of leaders of the non-selling movement for an embargo on marketing. Other relief activities of more than local interest included a milk strike in the New York City milk shed, in September and October. A gathering of executives of industrial firms to formulate a relief programme for agriculture, meeting at Chicago in November, was sponsored by the United States Chamber of Commerce. The Farmers' National Relief Congress, an outgrowth of the farm strikes, met in Washington in December to present demands for farm relief to Congress.

**AGRICULTURAL SITUATION.** Drastic retrenchments in the farm business and in family living as well, were indicated as the farmers' main defense, according to a year-end symposium of the agricultural situation all over the country by the U. S. Department of Agriculture. The reports from every section detailed the live-at-home programmes, the economies, and the trend back toward a subsistence type of farming, and confirmed the story of the migration from town back to the land. The low prices of farm products and the disparity between these low prices and the prices of goods and services which farmers must buy, were given as primary causes of farmers' difficulties. The complaint that debts and taxes represented an intolerable load upon the farm business at current price levels was universal.

The net agricultural production, i. e. for market or for use in the farm home, in 1932 was the lowest for any year since 1923, the index of net agricultural production for 1932, based upon preliminary estimates, being 103 per cent of the 1919-1927 average, compared with 112 in 1931, 107 in 1930, and 101 in 1923. The market decline in production from 1931 to 1932 was in response to smaller acreages and low yields of wheat and cotton, lower yields of fruits, and a slight curtailment in the production of dairy and poultry products. The total gross income from the farm production of 1932 was estimated at \$5,240,000,000 compared with \$11,950,000,000 in 1929, according to Department of Agriculture estimates. The re-

duction in gross income since 1929 was ascribed largely to national and world-wide changes in financial and economic conditions which brought about lower price levels in general, and curtailed demand for farm products in both domestic and foreign markets. The marked reduction in farm incomes from 1929 to 1932 was general for all farm products. In 1932, incomes derived from crops, totaling \$2,282,000,000, were only about 42 per cent of those of 1929, while incomes from livestock, aggregating \$2,958,000,000, were nearly 48 per cent of those of 1929. Income from major crops fell much more sharply than did the income from minor crops. Net farm incomes probably declined proportionately more than gross farm incomes in 1932 just as they did in 1931 and 1930, since production costs declined far less than prices of farm products.

The general level of prices paid to farmers at local farm markets for agricultural products was 52 per cent of the five-year pre-war average on Dec. 15, 1932 as compared with 66 per cent on Dec. 15, 1931. Estimates of average prices received by producers, Dec. 15, 1932, based on reports, were for corn 18.8 cents per bushel, wheat 31.6, oats 13, barley 19.3, rye 21.1, flaxseed 82.8, potatoes 36.8, and apples 61.7 cents per bushel; cotton 5.4 cents per pound, cottonseed \$8.87 per ton, and hay \$6.14 per ton. Hogs brought \$2.73 and sheep \$2.04 per 100 lbs., and beef cattle \$3.41 per cwt. Eggs were 28.1 cents per dozen, butter was 21.3 cents per pound, and whole milk wholesaled at \$1.26 per cwt. Wool and live chickens each sold for 9.2 cents per pound. Milk cows brought \$32 each, horses \$56, and mules \$61.

The value of all capital employed in agricultural production as of Jan. 1, 1932 totaled \$44,339,000,000, as compared with \$58,249,000,000 on Jan. 1, 1930, a decline of about 24 per cent. The farmers' equities in their property declined along with their current incomes so that their financial security as well as their standard of living was impaired. Values of farm real estate, reflecting severe declines in prices of farm products and purchasing power, registered new low levels. The acre value for all farm lands with improvements, averaged for the whole country, decreased from 106 per cent of the pre-war value to 89 per cent, during the year ended Mar. 1, 1932, compared with a 9 per cent drop in the year before. Values in two-thirds of the States were below pre-war levels. Foreclosures and tax-delinquent problems were intensified and forced sales were increased in number. The current decline in farm land values started from a relatively low level and not from a relatively high level. In a large measure the decline in farm land values after 1920, the first post-war slump, liquidated a wave of speculation, whereas the current decline reflected a writing down of values to correspond with a lower commodity price level.

**Credit.** Availability of farm credit of nearly all classes was at the lowest ebb in 1932 of any time in many years, according to the U. S. Department of Agriculture. Farm incomes from the production of 1931 dropped so low that country banks generally could maintain but a small fraction of their lending power and, moreover, had to stand the additional stress of the usual outflow of agricultural funds in mortgage interest, tax payments, etc. Agricultural distress affected the supply of mortgage credit, delinquent interest payments and a high foreclosure rate impressed mortgage lenders unfavorably, and special factors

in the investment market made matters worse. The life insurance companies had to meet an exceptional demand for policy loans; also, the value of their railroad and industrial securities declined drastically. Federal Land Banks and joint-stock land banks found the bond market unsatisfactory for the sale of additional securities. The credit stringency tended still further to lessen the earning power of the farmers, handicapping them in readjusting their crop programmes, and preventing the efficient utilization of feed and of labor time.

Relief in the credit situation was afforded by the Federal Government in several ways. It authorized production loans out of the relief appropriations remaining unexpended in 1931; it made additional provision for production loans in the Reconstruction Finance Corporation act; it amended the laws governing the operations of the Federal intermediate credit banks in such a manner as to increase their lending power; and it appropriated \$125,000,000 to increase the capital stock of the Federal land banks. Another measure authorized the Secretary of Agriculture to make loans from a \$10,000,000 revolving fund to assist individuals in organizing or enlarging agricultural-credit corporations and livestock loan companies. Other Federal legislation helped to relieve the farm credit stringency. The Reconstruction Finance Corporation helped agriculture through the relief it extended to banks generally. One of the most active factors in the year's agricultural financing was held to be the record amount of credit extended as crop production loans by this agency. A total of about \$65,000,000 up to Sept. 1, 1932, distributed in small loans throughout the country, brought direct financial aid to approximately 500,000 farmers.

**Mortgage Debt.** The mortgage debt bore down heavily upon the American agricultural industry in 1932. The total farm-mortgage debt in the United States rose from \$3,300,000,000 in 1910 to \$7,900,000,000 in 1920, and to \$9,500,000,000 in 1928, but since then it fell slightly, largely due to foreclosures. Interest and other costs on this mortgage debt in 1930 represented a fixed annual charge of \$568,000,000. The capacity to carry this charge declined greatly in the last two years, yet the charge remained about the same. In 1931, interest on the farm mortgage debt absorbed about 8 per cent of the gross farm income, compared with 4 per cent in 1920, and 3 per cent in 1910. In recent years an increasing number of farms have been mortgaged. The U. S. Department of Agriculture estimated that in 1930, 40 per cent of all farms were mortgaged. Its surveys showed that approximately 37 per cent of the mortgaged farms in the United States were indebted for more than half their value on Jan. 1, 1932. The largest proportion of farms with high debt ratios was found in the west north central States while the most favorable mortgage debt situation was in New England. Farms operated by owners showed a greater proportion of high debt ratio throughout the country than did farms of other tenure.

Farm mortgage loans were smaller in both total volume and average size in 1931 as compared with 1930, mortgage bankers in 17 western and southern States reported during the year. There were higher ratios of loans to value of farms, and more general use was made of the gradual payment system. Renewed loans represented a materially higher percentage (61.3) of

the value of mortgaged property than did new loans (39.4 per cent). Life insurance companies took 71.2 per cent of the total loans, less than in previous years, whereas a larger proportion of farm mortgages was bought by private investors and other local agencies. In September, 1932, farm mortgage loans by 40 life insurance companies aggregated \$1,395,000,000, a progressive decline from \$1,618,000,000 in 1927; by Federal Land Banks \$1,129,000,000 versus \$1,197,000,000 in 1929; by Joint Stock Land Banks \$454,000,000 versus \$667,000,000 in 1927; by banks of Federal Reserve System \$345,000,000, June 30, 1932 versus \$489,000,000, June 30, 1929; by Federal Intermediate Credit Banks—production and marketing loans for farmers' cooperative associations, \$19,000,000, and to financing agencies \$83,000,000, versus \$64,000,000 and \$66,000,000 in 1930; and crop production loans by the Reconstruction Finance Corporation amounted to approximately \$57,000,000.

**Taxes.** Farm property taxes for the whole country were during the last two years about 166 per cent higher than in 1914, yet there were clear indications of a continued decrease since 1929. With gross income down to the pre-war level, the tax load was extremely burdensome, although in a few States farmers received substantial relief. As in the case of the mortgage debt burden, its real weight was doubled by the fall in prices since 1929. In 1931 taxes on farm property absorbed about 11 per cent of the gross farm income, compared with only 4 per cent before the war. Increasing delinquency in the payment of real estate taxes in agricultural States and in cut-over forest areas was shown in recent reports by 30 State tax commissions.

The unfair tax burden on the farmers was attributed to increases in public expenditures and the failure of the tax system to allow for the post-war decline in farm incomes. The tax system, especially the so-called general property tax, discriminated against the farmer and the injustice was greater than a few years ago. Tax revision calls for substitutes for a substantial part of the general tax levy, although it appeared that attempts by States to draw large revenues from income taxes and excise taxes, the leading alternatives and the main reliance of the Federal Government, would necessitate coordination of Federal and State systems to avoid new inequalities. Reduction of farm taxes through reorganization of rural local government was considered an important possibility.

**Exports.** Exports of agricultural commodities, excluding forest products, in the year ended June 30, 1932, declined in value to \$752,141,000 or 28 per cent less than in the preceding year and, was the lowest since 1896-97. The percentage of agricultural products exported declined from 12.2 in 1928-29 and 10.2 in 1929-30, to 7.4 in 1930-31 and about the same in 1931-32. Exports of all the more important agricultural commodities, except cotton and wheat, declined in 1931-32. Exports of leaf tobacco and of meat and meat products each dropped 27 per cent. More barreled apples were exported, while exports of nearly all other fruits decreased. Exports of cotton rose from 7,180,000 bales of 500 pounds (including linters) in 1930-31 (fiscal year) to 9,131,000 bales in 1931-32; exports of cottonseed oil advanced to 41,038,000 pounds, and exports of wheat, including flour, increased slightly to 135,797,000 bushels in 1931-32.

**Imports.** The imports of principal agricultural products (excluding forest products and rubber) decreased in both volume and value, totaling in value \$783,475,000 in 1931-32, a decline of 28 per cent from 1930-31. The principal decreases in volume were in imports of wool, 31 per cent; oil cake and oil meal, 24; palm oil 30; and copra 21 per cent. Imports of flaxseed increased 77 per cent, those of olive oil increased slightly, and imports of silk, coconuts, and coffee declined slightly.

**Population.** The farm population in the United States showed the largest increase in 10 years, being estimated from U. S. Department of Agriculture surveys, as of Jan. 1, 1932, at 31,260,000, as compared with 30,612,000 on Jan. 1, 1931. The movement to towns and cities comprised 1,472,000 in 1931, while 1,679,000 persons went from cities to farms. When these movements and births and deaths were balanced, a net gain of 640,000 persons in farm population remained. Indications were that the farm population by Dec. 31, 1932, approximated 32,000,000 people, or close to the peak of 32,077,000 as of Jan. 1, 1910. Urban unemployment evidently was a significant factor in the change in the movement of population.

**LAND UTILIZATION.** The current depression emphasized further the need for a new land policy for American agriculture, Secretary of Agriculture Hyde called a national conference on land utilization which met in Chicago Nov. 19-21, 1931, to discuss the formation of a land-use programme. The conclusions reached at the conference, actions taken in 1932 by committees set up, and the widespread interest shown in many States, promised the replacement of this country's traditional policy of planless agricultural development with a comprehensive and thoroughly integrated programme of land utilization. This programme envisages a better economic utilization of the land resources, control of erosion, a far-sighted provision for future timber and public recreation needs, preservation of wild life, the gradual diversion to other purposes of lands submarginal for farming, guidance of proper enterprises in land settlement, and important adjustments in governmental organization in the distribution of local institutions and in local taxation and expenditures.

The national land-use planning committee and the national advisory and legislative committee on land use, since their initial meeting in February, 1932, made notable progress in defining objectives, formulating tentative policies, stimulating local interest in adequate land-use adjustments, and aiding in developing coordinated land-use planning programmes in individual States. At their meetings at Washington in November, 1932, the committees issued a statement condemning any wholesale, unguided back-to-the-land movement as the poorest possible solution of the unemployment problem, and reemphasizing the need for control and guidance of the movement by State and Federal agencies cooperating. A second statement called for immediate Federal regulation of grazing on unallotted and unserved public lands in the West, to check overgrazing, erosion, and damage to watersheds and irrigation districts. See also *Proceedings of the National Conference of Land Utilization*. (Washington, 1932.)

**CROP PRODUCTION IN 1932.** The area devoted to all crops harvested in the United States

in 1932, exclusive of fruits, was estimated to be 352,825,000 acres, about 1 per cent more than was harvested in 1931. There was a substantially lower production of crops raised for sale and much heavier production of feed crops than in 1930 or 1931. The leading cash crops, wheat, cotton, tobacco, and rice, showed the sharpest reductions, although the production of other cash crops, as flaxseed, rye, beans, and buckwheat, also was low, largely due to acreage reductions. Fruit production was below average due to adverse weather conditions, and the production of vegetables for commercial canning was the lowest for several years due to acreage reductions.

The 1932 production of feed grains was the largest since 1920, and the hay crop exceeded that of either 1930 or 1931. Outside of areas affected by drought, the total acreage of crops had been fairly stable during the last few years. Considering all crops, yields per acre on acreages harvested averaged 3.1 per cent above 1931, and 1.4 per cent below averages for the ten years 1919-1928. Due to drought, yields were below average chiefly in the Great Plains area and in an eastern area centring on Virginia. Reduction in the quantity of fertilizer used in the eastern and southeastern States appears to have tended to reduce the yields of cotton, potatoes, some vegetables, and some types of tobacco.

The preliminary estimate of the gross income from the 1932 crops was \$2,282,000,000 compared with \$2,764,000,000 in 1931, and \$3,808,000,000 in 1930. The total comprised grains, \$391,000,000; fruits and nuts, \$397,000,000; vegetables, \$632,000,000; sugar crops, \$67,000,000; cotton and cottonseed, \$397,000,000; tobacco, \$130,000,000; and other crops, \$268,000,000.

Wheat production in the United States was estimated at 726,831,000 bushels from 55,177,000 acres, a decrease of 19 per cent in production from 106,700 fewer acres than in 1931. The harvested acreage and the total production were for winter wheat 33,656,000 acres, 462,151,000 bushels; durum, 3,863,000 acres, 39,868,000 bushels; and other spring wheat, 17,658,000 acres, 224,812,000 bushels. The 1932 wheat production of 41 countries which produced about 75 per cent of the 1931 world wheat crop, exclusive of Russia and China, was officially estimated at a total of 2,979,416,000 bushels compared with 2,808,262,000 in 1931. The Canadian crop amounted to 431,200,000 bushels versus 304,144,000 in 1931. The 1932 production in 26 European countries was reported at 1,495,333,000 bushels, 4 per cent above the 1931 harvest. See WHEAT.

The corn crop in 1932, estimated at 2,908,045,000 bushels, exceeded the 1931 crop by 13 per cent and the 1930 crop by 41 per cent. Yields in 1932 were average or higher in all Corn Belt States, except Ohio and Nebraska, and mostly average or lower elsewhere. The total acreage, 107,729,000 was 2.3 per cent greater than in 1931, and the yield per acre averaged 27 bushels, compared with 24.4 in 1931. The production of corn for grain was estimated at 2,508,920,000 bushels, and the remainder of the crop was used for silage, fodder, hogging and grazing. Corn production in 19 foreign countries, reporting amounted to 851,215,000 bushels, compared with 761,133,000 in 1931. Eleven European countries reported a total of 708,407,000 bushels versus 605,547,000 in 1931. See CORN.

The 1932 oats crop was estimated to be 1,242,-

437,000 bushels, and harvested from 41,224,000 acres, compared with 1,117,970,000 bushels in 1931 from 39,800,000 acres. The acre yield averaged 30.1 bushels, 2 bushels more than in 1931. The production of oats in 31 countries accounting in 1931 for nearly all of the world total, excluding Russia and China, amounted to 3,437,362,000 bushels, compared with 3,086,263,000 in the previous year, and that of 24 European countries 1,676,660,000 bushels versus 1,537,361,000 in 1931. The Canadian crop was estimated at 419,556,000 bushels. See OATS.

The estimated total production of barley in 1932 was 299,950,000 bushels raised on 13,213,000 acres averaging 22.7 bushels per acre compared with 198,389,000 bushels on 11,419,000 acres averaging 17.4 bushels in 1931. The crop in 35 countries was reported to be 1,389,076,000 bushels, about 17 per cent above their 1931 production. The crop in 24 European countries reporting showed a total of 743,631,000 bushels, and in Canada 82,981,000 bushels. See BARLEY.

Rye production in 1932 rose to 39,855,000 bushels on 3,271,000 acres from 32,026,000 bushels on 3,060,000 acres in 1931. It averaged 12.2 bushels per acre in 1932 and 10.5 in 1931. The 1932 rye crop in 26 countries reporting, accounting for the greater part of the world production, except U.S.S.R. and China, was estimated to total 995,048,000 bushels against 815,481,000 bushels in 1931. Buckwheat production totaled 6,844,000 bushels from 464,000 acres, about 23 per cent less than in 1931, although on but 41,000 fewer acres. Rice made 39,356,000 bushels, on 869,000 acres, 15 per cent less production on 10 per cent smaller acreage than in 1931. See RYE, RICE.

The flaxseed crop in 1932 totaled 11,841,000 bushels from 2,087,000 acres as compared with 11,798,000 bushels and 2,416,000 acres in 1931. Feterita, kafir, milo, and other grain sorghums produced an estimated equivalent of 105,871,000 bushels from 7,850,000 acres, a slight increase over the year before. The portion of the acreage harvested for grain produced 65,053,000 bushels, 7 per cent less than in 1931. Broomcorn production, 33,300 tons from 284,000 acres, was one-fourth less than in 1931.

Production of sorghum (sorgo) sirup in 1932 amounted to 15,209,000 gallons; sugarcane sirup, 18,179,000 gallons, maple sugar, 1,601,000 pounds; and maple sirup, 2,394,000 gallons. The sugar beet crop of 1932 was estimated at 8,991,000 tons of beets from 768,000 acres, expected to produce more than 1,300,000 tons of sugar, against 7,903,000 tons of beets from 713,000 acres in 1931. The area of 217,000 acres of sugarcane in Louisiana was expected to produce 231,000 tons of sugar.

The hay crop, appreciably above that of either 1931 or 1930, was estimated to total 81,788,000 tons, of which tame hay made up 69,609,000 tons, and native or wild grasses 12,179,000 tons. The totals included alfalfa, 25,992,000 tons; clover and timothy, 26,033,000 tons; sweet clover, 936,000 tons; lespedeza, 343,000 tons; annual legume hay, 4,753,000 tons; grain hay, 5,162,000; sweet sorghum forage, 3,948,000 tons; and other hay crops, 6,390,000 tons. Larger yields of red and alsike clover seed, and smaller crops of seed of timothy, alfalfa, lespedeza, and sweet clover were reported in 1932. See HAY.

The potato crop was estimated at 356,589,000 bushels compared with 375,310,000 bushels in 1931; the average yield per acre 105.9 bushels

versus 111.2 in 1931. The Canadian crop was reported to be 69,575,000 bushels. Estimated production in 14 European countries producing about 77 per cent of the European crop, exclusive of U.S.S.R. (Russia), was 3,851,938,000 bushels compared with 3,764,294,000 bushels in 1931. The sweet potato crop was estimated to be 78,484,000 bushels; the peanuts harvested for picking or threshing at 1,002,080,000 pounds; cowpeas (except for hay), 11,007,000 bushels; and soy-beans (except for hay), 10,953,000 bushels. See POTATOES.

Tobacco production in 1932 was 1,033,330,000 pounds from 1,432,000 acres. The reduction of 29 per cent from the 1931 acreage was due almost entirely to a shift from cash to food and feed crops required by economic conditions. Decreases in production occurred in all classes. The flue-cured class was estimated to comprise 362,004,000 pounds of the total, 45 per cent less than in 1931; fire-cured, 127,679,000 pounds; Burley, 344,197,000 pounds; Southern Maryland, 22,750,000 pounds; dark air-cured, 41,960,000 pounds; cigar filler, 64,831,000 pounds; cigar binder, 62,387,000 pounds; and cigar wrapper, 6,825,000 pounds. See TOBACCO.

The cotton crop of the United States, according to December 1 estimates, was 12,727,000 bales, considerably less than the 17,096,000 bales grown in 1931, and the cotton was harvested from 37,589,000 acres compared with 40,693,000 acres in 1931. The yield of lint per acre averaged 162.1 pounds in 1932 and 201.2 in 1931. Exports of cotton during the cotton year ended July 31, 1932, totaled 8,707,548 bales compared with 6,759,927 in the previous year. Japan, United Kingdom, China, and Italy were the major consuming countries that greatly increased their imports. See COTTON and articles on other individual crops.

**FEDERAL FARM BOARD.** The board, in 1932, continued to devote most of its efforts to aiding producers to develop a strong cooperative marketing system under the mandate of the Agricultural Marketing Act of 1929. Further progress was made in the creation of new associations, in strengthening existing conditions, and in maturing their organization under the test of severe business depression. However, in the board's opinion, no system of organization would have been adequate to offset the drastic decline in demand for farm products, which characterized the year and largely masked the benefits of cooperative efforts. Stabilization purchases had been suspended before the beginning of the past year. Stabilization sales programmes during the year were carried on so as not to depress domestic prices, but instead to support them as far as possible. The results of this policy were particularly successful with wheat. Although over half the accumulated stabilization supplies were disposed of, here or abroad, farm prices for the 1931 crop were maintained well above their usual relation to prices on world markets.

**Cooperative Marketing.** Cooperative marketing made continued success in the fiscal year 1931-1932, the active membership in the various cooperative associations (eliminating duplication) comprising nearly 2,100,000 or more than one-third of all the farmers in the United States. Many new regional and State associations were formed for livestock, dairy products, poultry and poultry products, tobacco, seeds, and fruits

and vegetables, and many new cooperative projects were taken up.

Cooperatives, as a group, were able to make important contributions to the effective marketing of farm products during the year. These included the aiding of weak price situations by orderly marketing of standard products; providing outlets for farmers in hundreds of communities where no market existed because dealers either suspended operations, or were buying at ruinously low prices; marketing products by grades, and payment of premiums for superior quality; reductions and savings in operating costs; provision of financial facilities to their members; and leadership in the development of industry cooperation.

The quantity of products handled by cooperative associations increased by about 15 per cent during the year, but the value decreased from \$2,400,000,000 in 1930-31 to \$1,025,000,000 in 1931-32, due to the decline in prices of farm products. The total volume handled by cooperative groups in 1931 was estimated to approximate 14,000,000 head of livestock; more than 9,000,000,000 pounds of milk, about one-half of the consumption; 35 per cent of the creamery butter, 25 per cent of the cheese, and 28 per cent of the milk powder produced; wool 124,000,000 pounds, over 30 per cent of the clip; mohair 11,446,000 pounds, 60 per cent of the production; cotton, 2,521,169 bales, about one-sixth of the 1931-32 crop; and grain, 185,000,000 bushels (in 1931-32), handled by cooperatives at terminal markets, about one-sixth of the commercial movement. Cooperation reached significant proportions among producers of many types of fruits, vegetables, and nuts, the business of cooperatives handling these products in the 1931-32 marketing season totaling about \$291,000,000.

Up to June 30, 1932, the board loaned to cooperatives from the revolving fund for acquiring or constructing facilities, \$14,893,518 of which \$1,308,932 was repaid; for effective merchandising, \$181,441,439 of which \$102,819,158 was repaid; and on commodity advances \$160,576,469, reduced by repayments of \$82,682,474. Of the \$101,103,169 loaned to cooperative associations during the fiscal year 1931-32, loans were approved to new organizations, totaling \$1,561,690. Loans to cooperatives for all purposes exceeded \$100,000,000 in each of the three years of the board's operation, totaling \$356,969,627; and repayments were large, amounting to \$186,848,766 up to June 30, 1932.

In addition to its direct loans, the board continued to assist cooperative associations by organization surveys, and by aid in improving methods of operation and management, in developing sound marketing policies, and sales programmes and in improving the quality of services rendered.

The future development of cooperative marketing, the board indicated, must be along the lines of creating new associations where none now exist; bringing about fuller utilization of the marketing services offered by existing organizations; and increasing the effectiveness of the services rendered, both through improvements in the operation of individual associations, and through their coordination or merger into larger units for more efficient functioning. Much also remained to be done to develop active control of marketing organizations by the individual producers served.

**Stabilization Operations.** No further stabilization purchases were made by the Federal Farm Board in view of the large stocks already accumulated and the limited ability of stabilization to correct effects of prolonged economic depression. Attention was centred on disposing of stocks already owned so as to least affect prices for current production. More than half of the wheat supplies were disposed of, while in cotton, reductions in acreage helped to clear the way for subsequent disposition of stabilization stocks.

The disposition of wheat stocks accumulated in earlier efforts to maintain prices, went far toward completion during the year. By July, 1932, stabilization stocks had been reduced by export sales, 40,000,000 bushels; sales to China, Brazil, and Germany, 47,500,000; net sales in domestic markets, 20,000,000; transfer to Red Cross, 40,000,000; making a total of 147,500,000 bushels. Unsold stocks on July 1, totaling 108,000,000 bushels, included 36,000,000 bushels of futures and 72,000,000 bushels of cash wheat. Congress, in giving 45,000,000 bushels belonging to Grain Stabilization Corporation to the Red Cross, in July, 1932, reduced unsold holdings to 63,000,000 bushels, of which only 28,000,000 were cash wheat. By Sept. 5, 1932, most of these stocks had been sold, leaving only 3,000,000 bushels of cash wheat and 38,686,000 bushels of futures owned by the Stabilization Corporation. Under terms of a loan commitment given by the Reconstruction Finance Corporation early in September, these supplies were withdrawn from sale until after Jan. 1, 1933. The net cash gains to wheat producers as a result of stabilization operations up to June 30, 1932, were conservatively estimated at \$160,000,000 or \$6,000,000 in excess of the estimated cost of wheat stabilization operations at that date.

Activities in cotton stabilization during the year were confined to withholding from the market cotton already on hand. No further purchases of cotton were made by the Stabilization Corporation during the 1931-32 marketing season, and none was added to the unhedged stocks in hands of coöperative marketing associations. The board, however, did assist coöperatives to finance the handling of the 1931 crop. On May 2, the board authorized the Stabilization Corporation to sell, not to exceed 650,000 bales of its current holdings in the cotton year beginning Aug. 1, 1932, making efforts to distribute sales throughout the season without disturbing markets or price levels. Gradual liquidation of the stabilization stocks as authorized was begun during August. Prices of cotton and of other products began a continuous rise, which appeared to mark the beginning of revival from the bottom of the depression. To help maintain this improvement and to lessen competition between sales of the stabilization stocks and the new crop, arrangements, announced September 5, were made with the Reconstruction Finance Corporation to partially refinance the stocks of the Stabilization Corporation and the American Cotton Coöperative Association until March, 1933. In July, 1932, Congress turned over to the Red Cross 500,000 bales of stabilization cotton for relief purposes.

The Cotton Stabilization Corporation on July 31, 1932, owned 1,308,732 bales of cotton, worth \$42,523,912 at current prices or \$85,051,578 less than the sums invested in cotton stabilization.

Thereafter, cotton prices advanced and more than 300,000 bales were sold at higher prices. Similarly, the spot and future cotton from the 1929 and 1930 crops, which coöperatives were withholding from sale, totaling 1,825,202 bales on July 31, 1932, were valued at \$58,025,108 at current prices, or \$62,934,212 less than the sums invested.

Reviewing its experience with stabilization, the board concluded that no measure for improving the price of farm products other than increasing the demand of consumers can be effective over a period of years unless it provides a more definite control of production than has been achieved so far. In a few limited and specialized lines, coöperative associations have made progress toward such control. For the great staple products, however, the problem still remains for future solution.

**Other Activities.** Its experience during three years in administering the Agricultural Marketing Act led the board to recommend to Congress on Dec. 7, 1932, legislation to modify the stabilization sections of the agricultural marketing act so as to provide some means of elevating the returns to farmers from the production of exportable farm products, in such a way as to pay the costs, if any, on a continuous and self-sustaining basis, and to provide an effective system for regulating acreage or quantities sold, or both; to definitely authorize the board to make loans to associations engaged in the coöperative purchase of equipment and materials for farm production; and to place the board's services to coöperatives, financial and otherwise, on a permanent and self-sustaining basis.

The board also worked with other agencies, particularly the U. S. Department of Agriculture and the several States, in assisting coöperatives to secure adaptation of production to marketing needs, and aided the Department of Agriculture in developing a land utilization programme. It also maintained its usual coöperation with various agencies interested in developing the coöperative organization programme. The staff was reorganized after July 1 to correlate services, expedite the examination of loan applications, and increase the effectiveness of research and coöperative organization work.

The annual meeting of the American Country Life Association held at Oglebay Park, Wheeling, W. Va., Oct. 14-16, 1932, considered among other topics in its several assemblies the agricultural extension system, adult education by religious organizations, the cultural arts, rural adult education through the schools, extension of library service, and regional planning and adult education.

Consult also *Third Annual Report of the Federal Farm Board for the Year Ending June 30, 1932; Recommendations for Legislation: Special Report to Congress* (Federal Farm Board, 1932); *Coöperative Marketing Makes Steady Growth*, (Federal Farm Board, Bul. 8, 1932).

**WORLD AGRICULTURE:** *British Imperial Economic Conference.* Seven of the 12 new Imperial commercial agreements, concluded at the conference held at Ottawa, July 21 to Aug. 20, 1932, and later ratified, were between the United Kingdom and the several Dominions, and the remaining five were inter-Dominion agreements. However, the British market, rather than Dominion markets, is of major importance as an outlet for American agricultural exports. On the basis of

\* The production given countries of the Southern Hemisphere is for the crop years 1931-32 and 1930-31    <sup>b</sup> Average 1926-30.

information in official summaries made public, the chief items affected by various tariff preferences in the treaties, of significance to the United States from the viewpoint of direct competition in the British market, were wheat, apples, oranges, grapefruit, raisins, prunes, and bacon and hams. Some other agricultural items of a type that the United States exports more or less, also figured in the agreements. Tobacco was not involved except as the current substantial preferences to Empire producers were guaranteed for a period of years. (See also *Foreign Crops and Markets*, vol. 25 (1932) No. 12, pp. 404-423.)

*Canada.* The agricultural situation in Canada in 1932 was epitomized editorially in *The Country Guide* (Winnipeg) for November.

With wheat prices the lowest in 50 years; with beef, pork, lamb and mutton prices ruinously low and steadily declining, with butter and egg prices below production costs, with tax arrears, interest arrears and debts steadily mounting, the agricultural industry is in an extremely bad way. Not only is Canada's major industry facing ruin, but the lack of farm purchasing power is the direct cause of business stagnation throughout the country with a rising tide of unemployment and huge deficits being faced by municipalities, provincial governments and even by the Federal government. . . . Here in Canada the situation in the main is due to world-wide conditions. Looking at it from the purely domestic standpoint, however, it is due chiefly to the fact that farm prices have declined to a degree and with a rapidity out of all proportion to the decline in the prices of those commodities and services which the farmer has to buy in order to carry on his business. Agriculture could still carry on at the present prices of farm products if taxes, debts and interest and the price of everything the farmer has to buy had declined in the same proportion.

See CANADA under *Production and History*.

*Great Britain.* The plight of farmers in England was described as resembling that of American farmers. Although less than 30 per cent of English food was home-grown and the government had provided such artificial aids as the wheat quota, price fixing, and tariff duties on certain products, prices were demoralized, and farmers were operating at a loss, getting deeper into debt, and thousands were forced into bankruptcy and off the land. The under-development of agriculture in Great Britain was attributed mainly to unremunerative prices, a higher rate of wages than the land could carry, and shortage of capital. See GREAT BRITAIN under *Production*.

*Germany.* The agricultural situation in 1932 in Germany and the United States was reported to show several identical features including inadequate money returns, mortgaged farms, the outcry against interest rates and the middlemen, and the clamor for special protection. The situation in Germany was aggravated by the abundance of small peasant holdings with only a narrow margin between a living and acute physical distress, and, on the other hand, by the survival of a considerable number of gentlemen's estates—commonly unprofitable. The German situation was also most notably differentiated from the American agricultural problem by the political weight of the Reich's agrarian interests, a weight actually in excess of the agricultural vote.

*U.S.S.R. (Russia).* Agricultural production in Russia in 1932 seemed likely to fall far short of the official plans for the season, according to a review of current developments by the U. S. Department of Agriculture. Prospects were for another relatively short wheat crop. Cotton production might exceed that in 1931, but a slower

rate of increase compared with other recent years seemed probable. An unfavorable season, mechanical and management difficulties, and lack of incentive on the part of producers, were the principal weak spots in the current agricultural situation. See UNION OF SOVIET SOCIALIST REPUBLICS under *Production*. See also *Foreign Crops and Markets*, 25 (1932) No. 13, pp. 446-466.

*Foreign Agricultural Price-Supporting Measures.* That government intervention for the purpose of enabling farmers to obtain higher and more dependable prices for their products has been an outstanding feature of the world agricultural situation in recent years, was indicated in a U. S. Department of Agriculture report issued during the year. Since the World War, however, and particularly during the last three or four years, the trend toward a wider application of price-supporting measures had been especially marked; and since the onset of the world economic crisis in 1929 (of which the agricultural phase has been so prominent), there was scarcely a single country which did not engage in direct or indirect activity for the support of prices of home-grown products. As a result, the world's agriculture was operating under the impact of a greater variety and a more widespread application of artificial price-supporting measures than ever before in modern times. These measures comprised various restrictions imposed on imports, aids to branches of agriculture on an export basis, aids in the form of measures designed directly or indirectly to regulate exports, and production bounties and premiums, and other aids granted directly to the producer.

The effects, as well as the technique, of the measures applied with wheat and other farm products, directly concerned producers in the United States. The report pointed out that all such aids to agricultural export, whether applied to products of the type that the United States exports, as wheat and tobacco, or to those of the type that she imports but also produces, as wool and sugar, cannot but tend to lower prices received by producers in the United States. The Danubian grain monopolies and controls of recent date and the joint efforts of these countries to secure preference for their grain in European importing countries; the Canadian and Australian wheat bonuses; the Australian, South African, and Chilean export bounties on a range of agricultural products; and the many other foreign bounties and premiums on the production or exportation of crops such as are grown in the United States; all tend to intensify foreign competition with American agriculture.

*International Institute of Agriculture.* The general assembly of the institute, with delegates from 42 nations, met at Rome, Oct. 17, 1932. Problems of world agriculture were discussed, the delegates agreeing with the view expressed by the president of the assembly Sir Bhupendra Nath Mitra, High Commissioner of India in London, that current distressing conditions in agriculture could be remedied only by common action among the countries of advanced civilization. The thought stressed by several was that it was imperative at this time to keep open the channels of international communication and consultation, of which the institute was held to be the most effective as far as agriculture is concerned. The first publications of the world agri-

cultural census, carried out under the institute's leadership, covered the Irish Free State and Estonia.

**BIBLIOGRAPHY.** Books published in 1932, or late in 1931, which dealt with problems of current importance in agriculture included; *United States*: F. E. Clark, *Principles of Marketing* Rev. ed. (New York, 1932); F. E. Clark and L. D. H. Weld, *Marketing Agricultural Products in the United States* (New York, 1932); E. A. **AGRICULTURE, U. S. DEPARTMENT OF.** The report of the Secretary of Agriculture for the fiscal year ended June 30, 1932 dealt with activities and conditions during the past year rather than with prospects and developments in the future. The agricultural situation in general and its relation to farm incomes, commodity prices, land values, taxation, credit, and exports and imports of farm products were summarized and a discussion of scientific research as the basic task of the Department and pointing out that agricultural research lowers production costs, reduces waste, widens markets, finds new uses, adjusts production to demand, and improves quality was presented. It was shown further that among numerous lines of effort the services growing out of this research include foreign agricultural service, Federal standards and grades, crop estimates, services in home economics, extension and information, seed verification, and meat inspection. The more outstanding achievements of the Department resulting from its research activities, especially during recent years, were enumerated and treated in the light of their direct value to the farmer and their importance to the consuming public.

The expenditures and obligations of the Department of Agriculture for the fiscal year 1932 aggregated \$306,400,098 distributed as follows: Road construction \$212,421,775, emergency relief loans \$10,806,829, payments to the States for the support of agricultural experiment stations, extension work and cooperative forestry activities including fire prevention \$16,040,465, and for the ordinary activities of the Department \$67,131,029 of which only \$30,758,947 was of benefit primarily to agriculture. The amount for road construction included \$188,660,236 paid to the States for Federal-aid highways (see ROADS AND STREETS). A classification of the year's outlay by types of activity showed that \$22,563,863, or 7.4 per cent, was used for research, \$11,202,584, or 3.6 per cent, for extension work, \$12,118,145 or 4 per cent, for the eradication or control of crop and animal pests, \$11,996,034, or 3.9 per cent, for regulatory work, \$36,662,646, or 12 per cent, for public service activities, and \$211,856,826, or 69.1 per cent, for road construction excluding \$76,135 for highway service activities included in the preceding item. An analysis of these expenditures reveals that over four-fifths went to the general public rather than to agriculture, and only about one-tenth to the ordinary activities of the Department primarily for the benefit of the farm and the farm home. More than two-thirds of the

total was allocated to the States. Permanent savings for the year amounting to \$4,665,200, made in carrying on the ordinary activities by reducing pay roll, travel and supply expenses, by curtailing and postponing certain lines of work and by readjusting the programme of action in Washington and in the field, and unexpended balances approximating \$7,902,000 accrued on appropriations for loans, roads, and other purposes were turned back into the Treasury.

Numerous changes in the personnel were recorded for the calendar year. Those affecting positions of leadership were the appointments of Dr. S. O. Fladness in charge of interstate transportation of livestock, Packers and Stockyards Division of the Bureau of Animal Industry, to the position of assistant chief of the Field Inspection Division of the bureau made vacant by the death of Dr. W. P. Ellenberger late in 1931; of Dr. R. Snyder as the successor of Dr. S. O. Fladness in his former position and of Dr. H. W. Schoening as chief of the Pathological Division. Dr. Albert Hassall assistant chief of the Zoological Division was retired after a service of forty-four years in the bureau. H. W. White was appointed head of the Division of Truck-crop and Garden Insects of the Bureau of Entomology. R. M. Reese for many years chief clerk and later real estate officer of the Department and A. Zappone disbursing officer since 1905 were retired after the close of the fiscal year. Among the deaths recorded were those of Dr. N. A. Cobb, chief of the Division of Nematology of the Bureau of Plant Industry, and an outstanding authority on the group of worms known as nematodes or nemas; H. H. Barrows assistant chief of the Bureau of Agricultural Engineering, and W. C. Holmes of the Bureau of Chemistry and Soils, an expert in the synthesis of biological stains.

On July 1, 1932, the library of the Department including eleven branch libraries in various bureaus and offices contained 234,265 volumes including 18,200 books, pamphlets, and maps added during the fiscal year just closed. The periodicals received by purchase, gift, and exchange numbered 4250, and the books and periodicals sent to the Government Printing Office for permanent binding, 4755.

Two pavilions or wings of the new six-story office and laboratory building of the Department officially designated as the South Building were completed and occupied during the year. Contracts for the erection of the remaining five pavilions to be completed in two years were let and the work of construction begun.

**AIR-CONDITIONING.** See ELECTRICAL INDUSTRIES; ELECTRIC TRANSPORTATION.

**AIRCRAFT CARRIERS.** See NAVAL PROGRESS.

**AIRPLANES.** AIR RECORDS, AIRSHIPS, ETC. See AERONAUTICS.

**AKRON.** THE UNIVERSITY OF. A coeducational institution of higher learning in Akron, Ohio, founded in 1870 as Buchtel College and taken over by the city and renamed in 1914. The enrollment for the summer session of 1932 was 303 students and for the autumn day session, 1248 students, distributed as follows: College of liberal arts, 572; home economics department of liberal arts, 60; teachers college, 250; college of engineering and commerce, 366; 790 students were enrolled in the autumn evening session.

There were 84 faculty members. The amount of endowment was \$141,114 and the income for the year, including tax levy from the city, \$417,524. There were 32,224 volumes in the library. Among the important gifts received during the year was a \$50,000 bequest from the will of Isabel McRoy Pixley, wife of Frank Pixley, class of 1887. President, George Frederick Zook, Ph.D., LL.D.

**ALABAMA.** POPULATION. According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 2,646,248, as against 2,348,174 in 1920. The capital is Montgomery, which had, in 1930, 66,079 inhabitants. Birmingham had (1930) 259,678.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops for 1932 and 1931:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton ...	1932	3,159,000	930,000 <sup>a</sup>	\$29,295,000
	1931	3,397,000	1,420,000 <sup>a</sup>	40,044,000
Corn .....	1932	3,224,000	37,076,000	18,347,000
	1931	3,042,000	42,588,000	18,313,000
Hay ...	1932	679,000	483,000 <sup>b</sup>	3,384,000
	1931	614,000	478,000 <sup>b</sup>	4,268,000
Sweet potatoes .	1932	101,000	8,585,000	5,409,000
	1931	78,000	5,070,000	4,462,000
Peanuts ..	1932	466,000	242,320,000 <sup>c</sup>	2,908,000
	1931	382,000	229,200,000 <sup>c</sup>	4,355,000
Potatoes .	1932	36,000	2,484,000	2,087,000
	1931	39,000	3,666,000	2,530,000

<sup>a</sup> Bales. <sup>b</sup> Tons. <sup>c</sup> Pounds.

**MINERAL PRODUCTION.** The production of coal, normally furnishing the greater part of the total yearly value of the State's primary output of minerals, was further and sharply reduced in 1931, attaining only 11,620,000 short tons, as against 15,570,058, in value \$31,616,000, for 1930. The production of coke from the State's by-product ovens fell conformably in quantity to 2,943,143 short tons for 1931, from 3,986,920 for 1930; and in value to \$8,023,595 for 1931, from \$10,741,937 for 1930. There were produced in 1931 but 3,529,997 long tons of iron ore, as against 5,637,678 in 1930; in value, \$6,155,995 for 1931 and \$11,015,336 for 1930. Similarly, shipments of pig iron from the blast furnaces of the State again fell sharply, to 1,617,331 long tons for 1931, from 2,294,513 for 1930; and in value, to \$20,024,541 for 1931, from \$31,083,905 for 1930. The cement industry was less affected: shipments from the cement plants fell moderately to 4,476,400 barrels for 1931, from 4,689,516 for 1930; in value, to \$5,283,085 for 1931, from \$5,829,818 for 1930. Lime production was in reduced quantity, 139,000 short tons (estimated) for 1931 as against 164,822 for 1930; and of lower total value, \$758,000 for 1931 (estimated), as against \$929,302 for 1930. The value of the State's clay products was, for 1930, the latest year of available figures, \$2,295,334; for 1929, \$4,001,633. There was quarried in 1930 stone to the quantity of 967,320 short tons and to the value of \$2,111,340. The total value of the State's mineral product was \$55,461,985 for 1930 (duplications eliminated); for 1929, \$65,402,354.

**FINANCE.** State expenditures in the year ended Sept. 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$22,585,350 (of which \$7,130,950 was for local education); for conducting public-service enterprises, \$695,107; for interest on debt, \$4,402,251;

for permanent improvements, \$8,836,729; total, \$36,519,437 (of which \$9,156,680 was for highways, \$1,918,009 being for maintenance and \$7,238,671 for construction). Revenues were \$31,359,822. Of these, property and special taxes furnished 31.1 per cent; departmental earnings and compensation to the State for officers' services, 10.8; sale of licenses, 34.1 (in which was included a gasoline sale tax that produced \$3,484,040). Funded debt outstanding on Sept. 30, 1931, totaled \$66,535,336, of which \$42,859,000 was for highways. There were no sinking-fund assets against the total debt. On an assessed valuation of \$1,206,610,465 the State levied in the year ad-valorem taxes of \$7,842,968.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 5256.20.

**EDUCATION.** Great efforts were made during the summer, by the Alabama Education Association (the teachers' organization), with the aid of the State Department of Education, to win support through a speaking campaign, for measures to increase failing school revenues. For 1932 the number of persons of school age in the State was reported as 897,473. There were in that year 639,859 enrolled pupils. Of these, 504,029 were in grades from the first to the sixth, inclusive. In grades from seventh to twelfth, inclusive, were 135,180. The total expenditure for public-school education, in the year 1931, was \$21,495,577. Salaries of teachers averaged, by the year, \$609 for elementary positions and \$1041 in the high schools; for both groups together, \$734.

**CHARITIES AND CORRECTIONS.** The central authority of the State over institutions of care and custody, in 1932, was the Board of Administration. Although entitled a board, it was composed of but one member, styled a Director (William F. Feagin). It was charged with the duty of making all purchases for the State, it administered the State insurance fund, and it exercised management and control over the penitentiaries. These included a State farm, at Attmore, reported in December as having a population of 1150 white and colored males; Kilby Prison, Montgomery, 1504 white and colored males, and 12 colored females; Number Four Prison, Montgomery, 565 white and colored males; Speigner Prison, Speigner, 656 white and colored males; Wetumpka Prison, Wetumpka, 29 white and 146 colored females; a hospital at Wetumpka, 77 males; nine road camps at divers locations, containing 1070 colored males.

Hospitals for the insane, the Bryce Hospital at Tuscaloosa and the Searcy Hospital at Mount Vernon, were under a single self-perpetuating board of seven trustees. A board of control chosen chiefly by districts conducted the Jefferson Manley Faulkner Soldiers' Home at Mountain Creek. Under other separate boards were a Reform School (colored), the Partlow State School (mental defectives), a State Training School for Girls, at Pinson, the Alabama Boys' Industrial School, at Birmingham, and the Alabama School for the Deaf, at Talladega.

**LEGISLATION.** A Special session of the State Legislature was convened in August at the call of Governor Miller, to deal with financial needs. It voted the proposal to the vote of the people at the November election of a constitutional amendment to create a State income tax and also effected a series of economies in State expenditure.

**POLITICAL AND OTHER EVENTS.** A tornado of unusual severity caused much devastation in its track through the northern part of the State on March 21, causing 269 deaths in Alabama as well as 37 in Georgia and smaller numbers in Tennessee, South Carolina, and Kentucky. It was estimated to have injured some 2500 persons and to have destroyed the homes of 7000. Aid to the sufferers was supplied by the American Red Cross. The State Supreme Court upheld on March 24 a sentence of death upon seven Negro youths who had been found guilty under the law against the crime of rape, declaring them to have been fairly tried. The case, as it involved two young white women who had been riding on freight trains, was widely criticized outside the State, as being an extreme expression of the white racial sentiment, and formed a subject of agitation in some foreign countries. Appeal was taken to the Federal Supreme Court, partly on the ground that Negroes had been excluded from the jury; the Court declared a mistrial on the ground that the defendants' right to counsel had been infringed.

The State Public Service Commission issued a stringent order, similar to that issued somewhat earlier in Wisconsin, requiring utility companies to set up reserves to protect their capital in priority to dividends, and obliging them to make ample allowances for yearly depreciation of machinery. Hugo L. Black gained the Democratic nomination for United States Senator at the May primaries, and a delegation in favor of Franklin D. Roosevelt was sent to the Democratic National Convention.

**ELECTIONS.** Hugo L. Black was reelected United States Senator on November 8. The voters rejected a proposed constitutional amendment to provide a State income tax and another amendment to authorize a debt-funding bond issue of \$20,000,000.

For President, the popular vote was: Roosevelt (Dem.), 207,910; Hoover (Rep.), 34,675.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, B. M. Miller; Lieutenant-Governor, Hugh D. Merrill; Secretary of State, Peter B. Jarman, Jr.; Treasurer, Sidney H. Blan; Auditor, John Brandon; State Superintendent of Education, A. F. Harman; Attorney-General, Thomas E. Knight, Sr.

**Supreme Court:** Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, Joel B. Brown, Thomas E. Knight, Sr.

**ALABAMA, UNIVERSITY OF.** A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1932 the enrollment was 4408; the summer school registration was 1847. The faculty for 1932-33 numbered 200. The productive funds of the university amounted to \$3,228,842 and the income for the year was \$1,020,584. The library contained about 75,000 volumes, of which 20,000 were government documents. President, George H. Denny, Ph.D., LL.D.

**ALASKA.** A territory of the United States, the most extensive of the noncontiguous territories and possessions under the American flag. It forms a peninsula at the northwestern extremity of the North American Continent. Its total area is 586,400 square miles. The capital is Juneau. The population, according to the Fifteenth Census, was 59,278 in 1930; in 1920 it was 55,036.

**GEOLOGY.** Progress was made during 1932 with the United States Geological Survey's examination of the Anthracite Ridge coal basin, in south-central Alaska, on the northern side of the Matanuska River valley, some 200 miles north of Seward. This coal basin was found to extend some 4 miles by 7, between the river and the ridge to the north. The coal beds were determined to be in the Chickaloon formation of Tertiary fresh-water deposits with intrusive igneous dikes and sills, underlain by marine Cretaceous beds. The coal beds themselves were reported to range generally in thickness from a few inches to 8 feet, but thicknesses of 34 and of 24 feet were measured in a locality on the northwest border of the basin. In this portion of the field the type of coal was found to be semi-anthracite; in the southern and eastern parts of the field were located relatively thin beds ranging from semibituminous to bituminous. Observations of the location of the higher-grade coal permitted an estimate of only 750,000 tons, not a sufficient quantity to encourage commercial development. A synclinal area somewhat farther south in the basin was declared to warrant further study, and drilling was prosecuted during the summer.

**MINERAL PRODUCTION.** The total production of 1932, by value was estimated by the Geological Survey as \$10,938,000. Of this, gold supplied \$9,539,000; copper, \$531,000; silver, \$73,000; coal, \$535,000; other minerals, \$260,000.

The total value of minerals produced in 1931 was reported by the Geological Survey to be \$12,278,000, or considerably below the \$13,812,000 for 1930. The value of copper mined suffered a very heavy shrinkage, to \$1,877,000 (1931) from \$4,244,000 (1930). Silver, coal, lead, and tin were likewise mined in smaller totals as to value. There was, on the other hand, a substantial increase in the mining of gold, to a total value of \$9,507,000 (1931), from \$8,476,000 (1930). It resulted that gold supplied more than three-fourths of the value of the entire mineral product of 1931. The production of silver, in terms of value, was \$102,000 for 1931, and \$157,000 for 1930; that of coal, for the same respective years, \$556,000 and \$631,000; of lead, \$126,000 and \$136,000. Among the minor mineral products, in addition to tin, were petroleum, platinum metals, and limestone.

The production of gold in 1931 came from lode mines and from placers in the respective proportions of 49 and 51 per cent. More than 82 per cent of the lode mines' production came from southeastern Alaska, where the mining of great tonnages of low-grade ore was actively carried on with the aid of proximity to deep-water marine communication. Of the placer production, more than 77 per cent was contributed by 28 dredges active during the year; of these, 13 were in the Yukon Valley camps and 14 in the Seward Peninsula. Dredges handled some 10,214,000 cubic yards of gravel, from which gold was recovered at the average value of 36.7 cents a cubic yard.

**FISHERIES.** The fisheries maintained their rank as the chief industry of the Territory, employing some 22,500 persons. Their production in 1932, however, declined both in quantity and in value. For 1931, the value of the products of fisheries was \$33,594,752, falling short of the corresponding figure for 1930 by \$4,084,297. The output of canned salmon represented 96 per cent of the total value for fisheries in 1931. The

herring industry, on the other hand, was sharply depressed.

**SEALING INDUSTRY.** The herd of fur seals at the Pribilof Islands was estimated to number 1,027,028 in 1931, or approximately 9 times as many animals as in 1910. There were taken, in 1931, 49,524 skins of fur seals, or more than in any other year since 1889. Skins sold in 1931 brought an aggregate of \$546,219. Receipts from sales of seal skins and fox skins, accumulated in the United States Treasury since 1918, reached in 1931 the approximate total of \$6,000,000.

**FINANCE.** The Territorial Treasury offered a favorable contrast with the finances of many parts of the Union, showing on June 30, 1932, a credit balance of \$561,662, which was not far short of \$10 per capita of the population. The balance, however, was lower than that of a year earlier, which had been \$694,895. In the calendar year 1931, receipts were \$904,168; expenditures, \$1,196,731. The receipts from customs for the fiscal year 1932 were reported to have fallen below those of the year before by about 16.7 per cent.

**TRANSPORTATION.** Freight traffic on the Alaska Railroad ran, for the fiscal year 1932, well above that for the year before and brought an increase of 31.62 per cent in freight revenue. Passenger revenue made a slight increase, of 0.2 per cent. The deficit from operation of the railroad and of river boats affiliated with it decreased by 30.06 per cent, but stood at the still considerable figure of \$412,467. There were 31 airplanes engaged in furnishing transportation in 1932. Their service was stated by the Governor to extend to "practically every community in the interior" and to be aided by large and well-equipped fields at Anchorage, Fairbanks, and Nome.

**EDUCATION.** Territorial public schools in incorporated towns and districts reported for the academic year 1931-32, 2754 pupils in elementary and 908 in high-school grades. Territorial schools not in such districts had 1669 enrolled pupils. Higher education, chiefly technical, was given by the Alaska Agricultural College and School of Mines, which awarded 15 diplomas to graduating students in 1932.

**ALBANIA**, ăl-bă'nîa. A Balkan kingdom on the east coast of the Adriatic, situated between Yugoslavia to the north and Greece to the south. Capital, Tirana (Tiranë), with 30,806 inhabitants in 1930; reigning King in 1932, Zog I.

The area is approximately 10,629 square miles and the population at the census of May 25, 1930, was 1,003,068, as against 828,593 in 1927. The 1930 population included about 688,280 Moslems, 210,313 orthodox Christians (National Albanian Church), and 104,184 Roman Catholics. The other towns are Koritsa, or Korçë (population 22,787 in 1930) and Scutari, or Shkodër (29,209). Durazzo, or Durrës (8739) and Valona, or Vlone (9100) are the leading ports. Primary education is nominally compulsory, but the law is not enforced. There were about 900 young Albanians studying abroad, in 1929.

**PRODUCTION AND COMMERCE.** Primitive agriculture and cattle-raising are the principal occupations. Only about 926 square miles were under cultivation in 1932. The state owns about 125,000 acres of land and under King Zog has taken an active interest in modernizing agriculture. The leading products are tobacco, timber, hides, wool, furs, dairy products, cheese, fish,

olive oil, and corn. There are extensive forests and relatively unimportant mineral deposits, including copper, salt, and bitumen, capable of further development. Flour-milling, cheese-making, olive-pressing and similar agricultural industries are carried on. The heavy excess of imports over exports, due largely to Italian loans and expenditures in Albania, continued in 1930, with imports totaling 33,288,900 gold francs and exports 12,352,063 gold francs (gold franc equals \$0.1929 at par). Italy supplied imports valued at 16,707,000 gold francs, and took exports valued at 7,379,000 francs. Textiles, cereals, and metals are the chief imports and animal foods, hides and skins, and fish the principal exports.

**FINANCE.** In the budget estimates for the fiscal year ending Mar. 31, 1932, revenue was placed at 29,097,000 and expenditure at 31,533,422 gold francs, as compared with estimates balancing at 31,385,000 gold francs in the previous fiscal year. Following authorization by the Albanian Parliament, the Government in June, 1931, contracted with the Italian government for a series of ten annual loans limited to a maximum of 10,000,000 gold francs (about \$2,000,000) in any one year. The loans were to draw no interest, and the date and manner of repayment were to depend on the financial situation of Albania. A commission of two Italians and two Albanians were to supervise expenditure of the loan funds, devoting them chiefly to public works, national economic development, and education. It was stipulated that advisers approved by the Italian government were to be appointed to the Albanian Ministries of Finance, Public Works, National Economy, and Education; also that the payments would depend upon the "continuation of full and sincere technical and political collaboration between the two governments." A previous loan of 50,000,000 gold francs was floated in Italy in 1925 and is guaranteed by Albanian Customs receipts and the income from Government monopolies.

**COMMUNICATIONS, ETC.** Communication is chiefly by highways and, in the north, by pack animals. In 1930, there were 857 miles of completed roads and 360 miles under construction. Highways and five air routes connect the leading cities. There is a railway 22 miles long between Tirana and Durazzo (Durrës). Under the Constitution of 1928, the King administers the government, assisted by a council of ministers appointed by him and by a parliament of one chamber, the members of which are elected indirectly for four years. Premier in 1932, Pandeli J. Evangheli.

**HISTORY.** General elections held Nov. 12, 1932, resulted in the reelection of Premier Evangheli and all the members of his cabinet, as well as the majority of the members of parliament. The result was interpreted in Tirana as an endorsement of King Zog's efforts to modernize the country. The Albanian Legation at Washington on September 25 issued a denial of reports that 80 conspirators against King Zog's régime had been executed at Tirana. The Legation's statement said that the Albanian court had sentenced the chief conspirators, including seven who confessed, to 15 years' imprisonment.

Albania's precarious position as a buffer between Italy and Yugoslavia was emphasized in December, 1932, when a new Italian-Yugoslav crisis arose over Italian policy in Albania. It was reported that Italy was attempting to force King

Zog to accept a customs union as the price of a new loan and that King Zog, rejecting the proposal, had approached other governments with a request to free Albania from dependence upon Italy. The report was denied in Rome and Tirana. In Yugoslavia there was firm opposition to the customs union project, which would strengthen Italian military power upon the Yugoslav frontier (see ITALY and YUGOSLAVIA under *History*).

Consult Eugene Staley, "Italy's Financial Stake in Albania," *Foreign Policy Reports*, June 8, 1932, vol. viii, no. 7.

**ALBERT**, al'bâr', EUGEN (EUGÈNE FRANCIS CHARLES) d'. A pianist and composer, died in Riga, Latvia, Mar. 3, 1932. He was born in Glasgow, Scotland, Apr. 10, 1864, the son of Charles d'Albert, noted French composer of dance music, who was his first teacher. He studied at the National Training School, London, under Sir Arthur Sullivan, Ebenezer Prout, Sir John Stainer, and Ernst Pauer; in Vienna under Hans Richter; and in Weimar under Franz Liszt. In 1881 he made his first appearance at a philharmonic concert in Vienna with brilliant success. In his succeeding concert tours throughout Europe and America his mastery of technic, intellectual grasp, and poetic conceptions placed him among the most eminent pianists of the world. His interpretations of Bach, Beethoven, and Brahms especially were deemed the most forceful heard in recent years. In 1895 he was appointed court conductor at Weimar, and in 1907 he succeeded Joseph Joachim as director of the Hochschule für ausübende Tonkunst in Berlin. His compositions include two concertos for piano and orchestra, pianoforte music, a suite, a symphony in F, two quartets for strings, several songs, and the operas *Der Rubin* (1893); *Ghismonda* (1895); *Gernot* (1897); *Die Abreise* (1898); *Kain* (1900); *Der Improvisator* (1900); *Im Tiefland* (1903); *Das Floto Solo* (1906); *Tragaldabas* (1907); *Izyl* (1909); *Liebesketten* (1912); *Die Verschenkte Frau* (1912); *Die Toten Augen* (1916); *Der Stier von Olivera* (1918); *Revolutionshochzeit* (1919); *Sirocco* (1921); *Mareike von Nymwegen* (1923); and *Der Golem* (1926). Of these operas *Im Tiefland* was given at the Metropolitan Opera House in New York City in 1908; it has formed a part of the stock repertory of all German opera companies since its production in Prague in 1903. *Die Toten Augen* was presented by the Chicago Opera Company in 1923.

**ALBERTA**, al-bûr'tâ. The westernmost of Canada's Prairie Provinces, bounded by Saskatchewan on the east, British Columbia on the west, the United States on the south, and the District of Mackenzie on the north. Area, 255,285 square miles; population at the census of 1931, 731,605 as compared with 588,454 in 1921. The chief towns, with their census populations in 1931 and 1921 (in parentheses), are: Calgary, 83,761 (63,305); Edmonton (the capital), 79,197 (58,821); Lethbridge 13,489 (11,097); Medicine Hat 10,300 (9634). In 1930 there were 17,649 births, 5496 deaths, and 5334 marriages. Enrollment in the 3710 public schools (1930) was 168,076; in three normal schools, 1001; in the University of Alberta, 1578.

Agriculture is the chief occupation, but the extraction of coal, natural gas, and petroleum are important supplementary industries. The total acreage sown to field crops in 1931 was 13,600,731, compared with 12,561,400 in 1930.

The estimated gross agricultural revenue of the province in 1931 was \$135,219,000, of which \$96,907,000 represented field crops. Production of the chief crops in bushels (1931) was: Wheat, 136,000,000; oats, 90,500,000; barley, 20,800,000; rye, 1,100,000. The potato crop totaled 2,776,000 cwt.; hay and clover 394,000 tons. Alberta ranked fourth among the Provinces in mineral production in 1931, with an output valued at \$23,970,783 (\$30,427,742 in 1930). In 1930 coal production was valued at \$18,063,225; natural gas, \$4,929,226; petroleum, \$4,780,696. The total products of the lumber industry in 1930 were valued at \$2,390,587.

Executive power rests nominally with a lieutenant-governor appointed by the Dominion government, but actually with the Executive Council of the Provincial Legislature. Of 63 members in the Legislature (1932), 38 were United Farmers of Alberta, 11 Liberals, 7 Conservatives, 4 Labor, and 3 Independents. The Province sends 6 members to the Senate and 16 to the House of Commons at Ottawa. For the fiscal year ended Mar. 31, 1930, ordinary revenues and expenditures totaled \$15,829,865 and \$15,402,885, respectively. There was a deficit of \$2,306,581 for 1930-31. The gross bonded debt on Mar. 31, 1930, stood at \$106,888,380, of which \$38,936,134 represented self-supporting assets. In 1930 there were 5607 miles of railway line within the Province. A modern telephone system is owned by the Province, except for the city of Edmonton and the town of Banff, with 216,818 miles of wire, 329 exchanges, and 278 toll stations. Air lines connect the principal cities. Lieut.-Governor in 1932, W. L. Walsh; Premier and Provincial Secretary, John E. Brownlee. See CANADA.

**ALEXANDER, JAMES STRANGE.** An American banker, died in New York City July 16, 1932. He was born in Tarrytown, N. Y., Feb. 21, 1865. Beginning his banking career with the National Bank of Commerce in New York in 1885, he rose from clerk to assistant cashier in 1899. In 1907 he accepted the office of treasurer of the American Express Co., but the following year was requested to return to the National Bank of Commerce as vice-president. He was elected director of that bank in 1909, president in 1911, and chairman of the board in 1923. On its merger with the Guaranty Trust Co. of New York in 1929 he was made chairman of the board, in which capacity he served until his retirement the following year. He was also chairman of the board of the French-American Banking Corp. and held numerous directorships in industrial concerns, railroads, insurance companies, etc.

During the World War Alexander was secretary of the Second Federal Reserve District and was a member of the New York Liberty Loan Committee and of its sub-committee on money rates. He was president of the New York Clearing House in 1923 and was a member of the advisory committee of the Federal Reserve Board of the Second District during 1926-28. He acted also as chairman of the executive committee of the National Committee on European Finance and was a member of the advisory committee of the American section of the International Chamber of Commerce. He was made a chevalier of the French Legion of Honor and of the Order of the Crown of Italy, and a Knight Commander of the Order of Leopold II by King Albert for his services to Belgium during the World War and after.

**ALFALFA.** The production of alfalfa hay in the United States in 1932 was above the average. Estimates by the Department of Agriculture placed the yield at about 26,000,000 tons as compared with 21,000,000 tons the preceding year and an average of 23,000,000 tons for the five years 1924-1928. The production of alfalfa seed, however, was far below the yields of recent years amounting to only 538,000 bushels, or 32 per cent less than in 1931 and over 50 per cent below the yield in 1930. The small seed crop was due to the reduced acreage of 275,000 acres, 24 per cent less than in 1931 and to an unfavorable season in the principal producing sections. The average yield of alfalfa hay per acre was 2.08 tons as compared with 1.82 tons the year before. The yields of the leading States in tons were as follows: California 2,836,000, Idaho 2,251,000, and Nebraska 2,223,000. These three States produced over one-fourth the tonnage of the entire country. Only seven other States produced over a million tons and these with the States mentioned yielded nearly 70 per cent of the country's crop. Nebraska again stood first in area with 1,170,000 acres, the only State with more than a million acres. California ranked first in average yield per acre, 3.4 tons, being followed by Washington with 3 tons.

During the fiscal year ended June 30, 1932, the United States imported 352,700 pounds of alfalfa seed all of which came from Canada. The seed laws of many States require that certain factors determining quality such as origin, percentage of purity, percentage of germination, and the number of noxious weed seeds per pound be shown on the label. Since the spread of sweet clover throughout the country and especially in alfalfa producing regions the admixture of sweet clover seed to alfalfa seed which is increasingly frequent has become a matter of concern to purchasers of alfalfa seed. The gross farm income from the production of alfalfa seed decreased from \$11,520,000 in 1930 to \$5,738,000 in 1931, or slightly over 50 per cent and production and market conditions in 1932 did not better the situation. Alfalfa meal production during the fiscal year reached only 177,301 tons as compared with 294,154 tons for the preceding year. Two varieties, Hardistan and Kaw, highly resistant to alfalfa wilt have been developed by the Department of Agriculture and the Kansas Agricultural Experiment Station and have been found to assure successful stands for several years in wilt infested areas.

**ALFALFA WEEVIL.** See ENTOMOLOGY, ECONOMIC.

**ALGERIA.** A colony of France in northern Africa, comprising the two great divisions of Northern Algeria and Southern Algeria. Northern Algeria has an area of 80,117 square miles and a population at the census of Mar. 8, 1931, of 5,978,883; Southern Algeria, an area of 767,435 square miles and a population of 574,618. Of the total 1931 census population of 6,553,451 (6,066,380 in 1926), 920,788 were European (762,852 French and 157,936 foreigners) and the remainder natives. The native population, entirely Moslem, increased from 5,202,000 in 1926 to 5,633,000. The chief cities, with their populations in 1931, were: Algiers (the capital), 257,122; Oran, 163,743; Constantine, 104,902; Bona, 68,778. For the five years 1924 to 1928 annual births and deaths numbered 163,900 and 108,917, respectively, the excess of births being 54,982

annually. In 1930, there were approximately 129,000 pupils in elementary and secondary schools and 2010 students in the university at Algiers.

**PRODUCTION.** Algeria is primarily dependent upon agriculture, which is restricted to the coastal valleys and plains. In 1931, there were 14,945,000 acres of cultivated land, 442,000 acres of permanent meadow, 1,149,000 acres under trees and shrubs, and 9,479,000 acres of forests. Sheep, numbering 4,871,000, produced about 28,094,000 pounds of wool in 1931 (49,266,600 pounds in 1930). Other livestock included 872,000 cattle, 2,631,000 goats, 187,000 horses, 484,000 mules and asses, and 210,000 camels. The 1931 wheat crop was 25,649,000 bushels; barley, 27,069,000 bushels; oats, 8,212,000 bushels; corn, 238,000 bushels; potatoes, 2,786,000 bushels; grapes, 418,887,000 gallons of wine; olives, 6,103,000 gallons of olive oil; tobacco, 20,283,000 pounds; cotton, 2,390,000 pounds; dates, 500,444,000 pounds. Mineral production in 1931, in metric tons, with 1930 figures in parentheses, was: Iron ore, 911,000 (2,234,000); iron pyrites, 21,305 (16,228); zinc ore, 7727 (22,163); lead ore, 9164 (13,945); coal, 25,683 (17,173); petroleum, 1080 (1854); phosphates, 565,000 (864,000).

**COMMERCE.** The value of 1931 imports was 2.4 per cent less than in 1930, while exports declined by 13 per cent. Imports were valued at 5,573,400,000 francs (\$218,478,000), as against 5,711,200,000 francs (\$223,880,000) in 1930; exports at 3,704,500,000 francs (145,217,000) as compared with 4,272,100,000 francs (\$167,468,000) in 1930. France provided about 77 per cent of the total imports and took 72 per cent of the exports. Cotton fabrics, machinery, and metal manufactures were the leading imports and wine (340,920,000 gallons, valued at \$76,901,000) was the chief export. Declared exports to the United States in 1931 were valued at \$920,000; imports from the United States in 1929 were \$9,707,000.

**FINANCE.** Total expenditures, including disbursements of the War and Marine departments charged to France, generally exceed Algerian revenues by about 75,000,000 francs (franc equals \$0.0392 at par). For the fiscal year ended Mar. 31, 1932, ordinary revenues and expenditures were 1,199,056,329 and 1,195,401,883 francs, respectively; extraordinary revenues and expenditures, 973,615,000 and 951,115,000 francs, respectively. The separate Post Office budget estimates balanced at 261,079,413 francs. In the 1932-33 budget, revenue was estimated at 1,799,770,663 francs and expenditure at 1,799,640,616 francs. The public debt at the beginning of 1930 totaled 926,000,000 French francs, or \$36,299,000.

**COMMUNICATIONS.** Railway lines open to traffic in 1930 totaled 3009 miles, of which about 2000 miles were Government owned; railway receipts for the year aggregated 395,065,000 francs. In 1932, there were 31,409 miles of highways, including 4037 miles of surfaced national roads; 90 per cent of the highway system was built in the preceding decade. The telephone and telegraph systems are government owned. Vessels entering the ports in 1930 numbered 4920 of 8,306,000 tons; vessels clearing aggregated 8,393,000 tons.

**GOVERNMENT.** The central executive authority is the Governor-General. He directs all the services with the exception of the non-Moslem departments of public instruction, justice, worship, and the treasury, which are controlled by

the appropriate Ministries in Paris. The Governor-General, with the Minister of the Interior, prepares the budget which is voted by the so-called financial delegations and by the Superior Council. The Superior Council is composed of elected members and high officials. There is also a purely consultative council of government. The colony sends to the French Parliament one Senator and three Deputies from each of the three departments. The Parliament at Paris has the sole right to legislate for Algeria. Governor-General in 1932, M. Jules Carde, appointed Oct. 3, 1930.

**HISTORY.** A troop train carrying 500 officers and soldiers of the French Foreign Legion plunged into a ravine near Tlemcen on Sept. 14, 1932, killing more than 50 and injuring more than 100.

**ALIEN DEPORTATION.** See IMMIGRATION.

**ALKALOIDS.** See CHEMISTRY, INDUSTRIAL.

**ALL AMERICAN CANAL.** See CANALS.

**ALLEGHANYITE.** See MINERALOGY.

**ALLEGHENY COLLEGE.** A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1932 was 604, and for the summer session 105. The faculty numbered 44 members. The productive funds of the college amounted to \$1,500,000, and the income for the year 1931-32 was \$425,899. The Reis Library contained 87,000 volumes. This library was also doubled in size by a \$100,000 addition, making its capacity 225,000 volumes. President, William P. Tolley, Ph.D., D.D.

**ALLEN, HORACE NEWTON.** An American diplomatist and missionary, died in Toledo, Ohio, Dec. 11, 1932. He was born in Delaware, Ohio, Apr. 23, 1858. Upon his graduation from the Ohio Wesleyan University in 1881, he studied medicine at the Miami Medical College and went as a medical missionary (Presbyterian) to China. In 1884, at the time of the *coup d'état* of Kim Ok Kiun, he was at Seoul, Korea, and saved the life of a relative of Queen Ming. He was made court physician and established a hospital under government control. When the first Korean legation went to Washington in 1888, he acted as interpreter and secretary. On his return to Korea he soon became noted for his knowledge of Korean affairs and in 1890 was made secretary of the United States legation. In 1897 he was promoted to minister resident and counsel-general, and from 1901 to 1905 served as minister. His publications include *Korean Tales* (1889); *Chronological Index of the Foreign Relations of Korea from the Beginning of the Christian Era to the Twentieth Century* (1900; supplement, 1903); *Korea—Fact and Fancy* (1904); and *Things Korean* (1908).

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'.** An association of clubs and groups formed for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. It was established in 1902 and in 1932 comprised more than 270 local branches, including French Alliances, affiliated societies, and French clubs in universities, colleges, and schools. Seven new groups were added to the Fédération during 1932. Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear

them. It organizes also lecture tours for distinguished French travelers and for French lecturers who live in America, assists in organizing courses in the French language and literature in coöperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. The official lecturers for the season 1931-32 were Julien J. Champenois, director in the United States during 1919-26 of the Office National des Universités et Écoles Françaises, and Léon Vallas, former professor of the history of music at the University of Paris, biographer of Claude Debussy, and editor of *Revue Française de Musique* and *Nouvelle Revue Musicale*. The Fédération's Assemblée Générale, attended by representatives of the various groups, was held in New York City Apr. 2, 1932. The official periodicals of the organization are *L'Écho de la Fédération* and *Bulletin Officiel*.

The officers in 1932 were: president, Frank D. Pavey; general vice president, William Nelson Cronwell; president of the executive committee, Albert Blum; treasurer, John F. Daniell; and general secretary, Roger Sherman. Headquarters are at 32 Nassau Street, New York City.

#### ALLOYS. See CHEMISTRY, INDUSTRIAL.

**ALSACE-LORRRAINE**, *äl'zäs'lör'än*. The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France by the Versailles Treaty (June 28, 1919), to date from the Armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin (formerly Lower Alsace), 1848 square miles and 688,242 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles and 516,726 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 693,408 inhabitants. Total area, 5605 square miles; total population, 1931 census, 1,898,376. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, as well as extensive iron-ore and potash deposits. Consult, Edmond Vermeil, "Religion and Politics in Alsace," *Foreign Affairs*, January, 1932.

#### ALTITUDE RECORDS. See AERONAUTICS.

**ALUMINUM**. New aluminum produced in the United States in 1932 amounted to 104,885,000 lbs. (52,440 short tons), valued at \$20,453,000, representing decreases of 41 per cent in quantity and 45 per cent in total value compared with 1931 according to statistics collected by the U. S. Bureau of Mines. Production in 1931 amounted to 177,544,000 lbs. and was valued at \$37,284,000, showing declines of 22 per cent in quantity and 27 per cent in value as compared with 1930. Secondary aluminum to the amount of 30,300 short tons was recovered during 1931; thus the total production of new and secondary aluminum for 1931 amounted to 119,072 tons. Figures are not available on the recovery of secondary aluminum in 1932. According to the *Engineering and Mining Journal*, the domestic price of new aluminum ingot 99 per cent pure was maintained at 23.3 cents a pound throughout the year. The open-market quotation at New York for virgin metal 98 to 99 per cent pure was held at 22.9 cents a pound.

There was a pronounced decline in consumption in 1932, which was partly offset by promising developments in certain uses in which declining consumption was less marked. Thus development in adapting the metal for architectural purposes continued. Aluminum sheet and insulating material have been used in wall con-

struction. Such walls are said to have an insulating value more than ten times that of an equal thickness of much heavier material, and their average weight is only 10 pounds a square foot.

The resistance of aluminum to acid corrosion by the atmosphere of cities encourages its use as roofing and as an ornamental metal on the exterior of important buildings. The same property of aluminum led to the extension of its use in the dairy industry. Aluminum in milk-tank trucks makes unnecessary an inner liner for tanks, decreases the dead load, and increases the pay load. Its use in milk cans is becoming more extensive; milk-bottle caps of aluminum foil that seal the bottle have been introduced. Aluminum foil is also used for wrapping butter and cheese.

In transportation aluminum is gaining wider application. Although its consumption in pleasure cars has declined, some manufacturers are understood to have reduced materially the weight of the chassis through use of aluminum. The tonnage of aluminum employed in trucks and busses has continued to increase. The metal makes possible the use of dump trucks and trailer units of large capacity. Considerable aluminum is used in the production of electric street cars, and an all-aluminum Pullman car was built.

A recent trial of duralumin skips and cages in three mines of the Rand in South Africa, according to *The Mining and Industrial Magazine of Southern Africa*, indicates economies resulting from use of this lighter metal. It is stated that, although the initial cost of duralumin equipment is more than double that of all-steel equipment, one of the skips has a capacity of 7 tons, instead of 6 tons, as do steel skips, while the gross load on the rope is 445 pounds less. A saving in current of £1000 per annum has been shown. For a given tonnage hoisting time is reduced nearly 20 per cent. No noticeable corrosion is recorded in skips that have been in service 12 months, although acid mine water corrodes steel cages.

The consumption of aluminum in aircraft is said to have declined sharply, but experimentation in this field continued. The welding of aluminum is being subjected to intensive research with especial reference to the requirements of aircraft.

Electrical conductors of a new type are being made of aluminum channels arranged face to face to form a hollow square in cross section. This type is more rigid and weighs much less than a flat bus bar.

Progress has been made in anodic coating of aluminum with a film of oxide that increases resistance to abrasion and corrosion. It also serves purposes of decoration, and as the oxide coating absorbs dyes the metal may be colored. This has already proved useful for packaging, and it is being applied to interior decoration.

In the past year there is said to have been extension in the use of aluminum paint for mill priming lumber and semi-fabricated products, such as sash and frames. The paint includes aluminum-bronze powder as a pigment.

A new alloy consisting of aluminum with 1 per cent each of manganese and magnesium is reported. Its field is expected to be between that of heat-treated strong alloys and that of simple wrought alloys.

Consumption of aluminum foil has increased,

The following quotation from *Metal and Mineral Markets* is of interest:

In Germany . . . the annual production (of aluminum foil) has reached almost 5000 tons. . . .

Among new applications, the use of crumpled foil as an insulating material is probably the most important. Extreme lightness—barely three ounces per cubic foot; high thermal efficiency; low heat storage; resistance to corrosion by fumes and moisture; and freedom from fire hazards are among the advantages gained; the material is easily applied, is clean, and vermin proof. Limited area of contact and the thinness of the sheets minimize conduction of heat through the foil itself. This material is rapidly finding wide application, in refrigerator systems on ships, railroad cars, and trucks, cases in which the light weight makes possible an important increase in pay load. Other uses are in household refrigerators, food industries, high-pressure steam installations, and home insulations.

Use of aluminum foil in printing is another new application demonstrated recently on the annual Leipzig Fair, the show place of German industrial and commercial progress. A printing plate, cheaper than the usual paper matrix, may be produced by writing on foil, either by hand or by machine. As many prints as desired, in several colors, may be reproduced from such a plate. Drawings may be made directly on the foil or by tracing from the original, and impressions from line cuts and type are also easily reproduced. The plates are waterproof, light proof, and true to type; they may be kept indefinitely without deterioration.

Models and statuary made from kneaded foil, for show cases and exhibits, produce most striking effects. Such applications as these, introducing the metal into entirely new fields, and involving no destructive competition with other metals, are encouraging signs. Smoothing out the curve of depression, they also offer hope of more speedy recovery when business again turns upward.

The European aluminum cartel, formed in 1926 by producers of Germany, France, Great Britain, and Switzerland, and subsidiary plants of Germany and Swiss companies in Italy, Austria, and Spain was reorganized as of Jan. 1, 1932. The new organization, called the Alliance Aluminum Co., with its office at Basel, includes all former members and the Canadian industry as well. The new cartel thus has achieved a world scope for all practical purposes, because the industry in the United States is chiefly concerned with the domestic market.

It was claimed that the price of £95 per ton, maintained by the cartel for two and one-half years until October, 1931, was too high, in view of the heavy decline in the prices of other metals and the contraction of demand for aluminum. The syndicate, therefore, on Jan. 1, 1932, reduced the fixed price charged by syndicate members to £80 a ton, gold. The original price, established in 1926, was £105; therefore the total reduction amounts to 24 per cent.

**AMANA COMMUNITY.** See COMMUNISM under *United States*.

**AMATEUR RADIO TELEGRAPHY.** See RADIO.

**AMERICAN ARCHITECTURE.** See ARCHITECTURE.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

**AMERICAN BAR ASSOCIATION.** See LAW IN 1932.

**AMERICAN CHEMICAL SOCIETY.** See CHEMISTRY, INDUSTRIAL.

**AMERICAN FEDERATION OF LABOR.** See LABOR, AMERICAN FEDERATION OF.

**AMERICAN LAW INSTITUTE.** See LAW IN 1932.

**AMERICAN LEGION.** An organization of World War veterans, chartered by Congress in 1919. Its purpose is "to uphold and defend the

Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, State, and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The Legion's fourteenth national convention was held in Portland, Ore., Sept. 12-15, 1932. There was an accredited delegate attendance of 1289, representing every State, the District of Columbia, nine departments outside the continental limits of the United States, and one foreign post, Brussels, Belgium. Unusual public interest was attached to the convention because of controversial issues and the fact that it was a presidential election year, although partisan politics are carefully avoided in any Legion connection. Among the distinguished guests present and addressing the convention were Secretary of War Patrick J. Hurley and Floyd Gibbons, the newspaper correspondent whose controversy over the ousting of "B.E.F." marchers in Washington earlier attracted national notice.

Among the outstanding mandates adopted by the convention were the following which the national legislative committee, meeting in November, selected as its major legislative programme: six pieces of disabled veterans' legislation, listed as presumptive class, to include all chronic, constitutional, and analogous diseases; extension or cancellation of limitations on filing insurance suits; dependency payments in permanent ratings to be not less than temporary rating; outpatient medical treatment for all World War veterans, not dishonorably discharged; extension to July 2, 1941, of the date prior to which a World War veteran must marry to entitle his widow to compensation of any pension; and condemnation of any attempt to write a pauper clause or needs clause into any legislation affecting veterans, their widows, or dependents. The legislative programme included also hospital construction, covering all requirements advocated by the Portland convention; immediate enactment of the Senate resolution to create a separate committee on veterans' legislation, such as now exists in the House; national defense; endorsement of the final recommendations of the War Policies Commission, the national legislative committee being instructed to obtain the enactment of bills already introduced to carry into effect the principle of universal draft in time of war; immediate payment of adjusted compensation; and support of legislation for the immediate repeal of national prohibition.

The accomplishments for the year 1932 up to the time of the national convention were reviewed in the report of Henry L. Stevens, Jr., the retiring national commander:

**Rehabilitation.** Money recoveries for veterans from the Government, effected through the work of the national rehabilitation committee of the Legion, during the fiscal year ending June 30, 1932, amounted to \$7,509,126, which was an increase of \$1,052,739 over the preceding fiscal year.

**Child Welfare.** Necessities of life were furnished direct to 2160 children of veterans in distress. Hundreds of thousands of dollars and other material aid were secured for veterans' children by local and department Legion officials from child welfare facilities in communities, counties, and States.

**Legislation.** An attempt by economy groups to make a horizontal slash of \$80,000,000 in benefits to disabled veterans and their dependents was successfully prevented. The rate on adjusted compensation loans was reduced; government term insurance was extended another five years; and codification and printing of old laws dealing with veterans of all wars was secured.

**Americanism.** Flag study sponsored by the Legion was used by 27,000,000 school children; over half a million participated in the junior baseball competition; and more than 35,000 school children received the Legion's school medal. There were also sponsored more than 200 worthwhile projects in community service.

**Employment.** More than 1,000,000 unemployed persons were placed in jobs, 3177 towns and cities reporting such Legion activities. A total of \$51,971,843 was pledged in private and public repairs and improvements under the so-called "made work" plan.

The membership of the American Legion on Dec. 2, 1932, was 930,163. The national officers elected for 1932-33 were: commander, Louis A. Johnson, Clarksburg, W. Va.; vice-commanders, Russell Meadows, Douglas, Ariz., Robert D. Flory, Albion, Nebr., William E. Easterwood, Jr., Dallas, Tex., John J. Maloney, Portland, Me., Charles A. Mills, Miami, Fla.; chaplain, the Rev. Irvin Q. Wood, Pocatello, Idaho; historian, Eben Putnam, Wellesley Farms, Mass.; treasurer, Bowman Elder, Indianapolis, Ind.; judge advocate, Remster Bingham, Indianapolis, Ind.; and adjutant, Frank E. Samuel, Indianapolis, Ind. National headquarters are at 777 North Meridian Street, Indianapolis, Ind.

**AMERICAN LITERATURE.** See LITERATURE, ENGLISH AND AMERICAN.

**AMERICAN SAMOA.** See SAMOA.

**AMHERST COLLEGE.** An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1932 approximately 700 students were enrolled. The active faculty, exclusive of administrative officers, emeriti professors, and those on leave, numbered 75. The productive assets of the college amounted to \$9,000,000, and the income for the year was \$808,000. The library contained 180,000 volumes. President, Stanley King, LL.D.

**ANABASINE.** See CHEMISTRY, INDUSTRIAL.

**ANALYSIS, CHEMICAL.** See CHEMISTRY.

**ANALYTICAL CHEMISTRY.** See CHEMISTRY.

**ANAPLASMOSIS.** See VETERINARY MEDICINE.

**ANATOLIA**, ân'a-tô'lî-â. An ancient geographical name for the land east of the Ægean Sea, now loosely applied to the western part of Asia Minor. See TURKEY.

**ANATOMY OF PLANTS.** See BOTANY.

**ANDORRA**, ân-dôr'râ. A tiny state in the Pyrenees, under the joint suzerainty of the French President and the Spanish Bishop of Urgel. Area, 191 square miles; population, 5231 in 1924; capital, Andorra-la-Vieja (population, 700). The Andorrans, who speak Catalan, are

governed by an elective council of 24 members, acting through a First Syndic. The two civil judges are appointed by France and the Bishop of Urgel, respectively. There is a customs union with France and a postal union with Spain.

**ANEMIA.** See FOOD AND NUTRITION.

**ANGLO-EGYPTIAN SUDAN.** A condominium governed by Great Britain and Egypt in the upper Nile region of Africa, extending south from Egypt and Libia to British East Africa and the Belgian Congo; bounded on the east by the Red Sea, Eritrea, and Ethiopia, and on the west by French Equatorial Africa. Area, estimated at 1,008,100 square miles; population recently estimated at 5,605,848. Capital, Khartoum, with 50,463 inhabitants; other cities, Omdurman, 103,669; Khartoum North, with adjacent rural district, 107,720.

In January, 1931, there were 89 elementary vernacular schools (Kuttabs) with 8348 pupils; 11 primary schools, with 1310 boy pupils; 21 girls schools, attended by 1946 pupils; and 768 native schools (Khalwas) aided by the Government, with 26,880 (1930) pupils. The Sudan furnishes most of the world's gum arabic, and exported, in 1931, 20,086 tons valued at ££602,753. The 1931-32 cotton crop was estimated at 200,000 bales (averaging 478 pounds); 106,000 in 1930-31. Area under cotton in the 1930-31 season amounted to 373,051 acres which yielded 513,820 kantars of 315 pounds of seed cotton. Senna, dates, ground-nuts, salt, ivory, hides and skins, and gold are other leading products. Live-stock in 1930 included about 1,505,000 cattle, 2,200,000 sheep, 400,000 camels, 22,000 horses, 200,000 goats, 5000 pigs, and 350,000 asses. Valuable forests border the Nile and its branches. Imports in 1931, including Government stores, were valued at ££3,761,013; and exports, including re-exports at ££1,717,078. The Egyptian pound averaged \$4.66 in 1931.

Budget estimates for 1931 balanced at ££4,398,618, including net receipts from railway and steamboat lines, compared with ££4,929,000 estimated in 1930. Railway lines open for traffic in 1930 totaled 1990 miles and linked the chief interior points with the Red Sea at Port Sudan and Suakin. There were about 225 miles of main highways besides 12,740 miles of roads passable to light motor cars in dry weather. A fleet of Government steamers sails the navigable arms of the Nile and its tributaries and there is a heavy trade by caravan.

Under the Anglo-Egyptian convention of Jan. 19, 1899, the Sudan is administered by a governor-general appointed by Egypt with the assent of Great Britain. The British and Egyptian flags are flown together. Since 1910, when a governor-general's council was created, laws have been made by the Governor-General in Council. The Sudan is divided into 13 Provinces, each under a governor. Following the assassination of Sir Lee Stack in 1924, Egyptian troops in the Sudan were evacuated and a force of Sudanese under British officers was organized under the direct authority of the Governor-General. Governor-General in 1932, Sir John L. Maffey. See EGYPT.

**ANGOLA** an-gô'la, or **PORTUGUESE WEST AFRICA.** A Portuguese colony on the west coast of Africa, situated between the Belgian Congo and Southwest Africa. Area, 486,071 square miles; population (1929), 2,500,000 including about 40,000 Europeans. Capital, New

Lisbon (Nova Lisboa); formerly known as Huambo; other important towns, Loanda, Cabinda, Ambriz, Novo Redondo, Benguela, Lobito, Mossamedes, and Porto Alexandre. The interior plateau lands are fertile and well watered. Lobito, considered the best natural port on the west coast of Africa, has replaced Benguela as the shipping point for southern Angola.

In 1930, there were 68 elementary schools for Europeans and 26 industrial and 20 agricultural schools for natives, with a total enrollment of about 5000. The principal products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products include gold, diamonds, malachite, copper, iron, petroleum, and salt.

Imports in 1930 amounted to 245,633; 206 angolares (80 angolares = 100 Angolan escudos) and exports to 233,968,548 angolares. Trade is largely with Portugal. Budget in 1931-32 balanced at 142,759,000 angolares.

Railway lines in operation in 1930 totaled 1436 miles. The Benguela Railway from Lobito was linked with the Katanga Railway in the Belgian Congo in March, 1931, affording a shorter outlet for the mineral wealth of Katanga and Northern Rhodesia, and completing the final link in a transcontinental system connecting Lobito with Beira on the east coast and with Cape Town on the south (see CONGO, BELGIAN). There are 18,000 miles of roads, 5790 miles of telegraph line, 259 miles of telephone line, and 19 wireless stations. Government is in the hands of a governor-general, assisted by a partly elective consultative council. There is a military force of 740 Europeans and 6000 natives. High Commissioner and Governor-General in 1932, José Dionísio Carneiro de Sousa e Faro.

**ANHALT**, an'halt. A state of the German Republic. See GERMANY under *Area and Population and History*.

**ANIMAL DISEASES.** See VETERINARY MEDICINE.

**ANNAM**, an-nām'. An Asiatic protectorate of France, forming a part of French Indo-China. King Bao-Dai (became king on Nov. 6, 1925) is the nominal head of the government, and is assisted by a Council of Ministers, but actual power resides in the French Resident-Superior. A Chamber of Representatives with limited powers was established in 1926. Resident-Superior in 1932, A. E. Le Fol. See FRENCH INDO-CHINA.

**ANNIVERSARIES.** See CELEBRATIONS.

**ANORTHOSITE.** See GEOLOGY.

**ANSCHLUSS.** The movement for the political union of Austria and Germany.

**ANTARCTIC EXPLORATION.** See POLAR RESEARCH.

**ANTHROPOLOGY.** The year has not been especially fertile in the appearance of either novel views or the collection of new materials. This is due only in part to the curtailment of investigations by the current economic depression, but must be set down also to accident. Some years have been richly productive, others lean: 1932 was one of the latter. Publication during the year was only moderate. The principal sources for published material during the year have been, in Europe, the *Anthropos* group in Vienna, and in the United States, the Smithsonian Institution and the University of California.

The two most striking news features of the year were the discovery of a rich treasure hoard at Monte Albán in southern Mexico, and of a

group of skeletons of the fossil human race, Neanderthal, at Mount Carmel, Palestine.

In January it was announced that A. Caso had uncovered a Mixtec tomb at Monte Albán, Oaxaca, containing gold work, semi-precious stones, and turquoise inlay which for intrinsic value have never been surpassed in America. Additional finds were made throughout the year, and only a beginning was made in the Monte Albán area. In this connection an important decision was rendered by the Mexican Supreme Court; that the country's archaeological sites are under the jurisdiction of the Federal government, and not under that of the individual states. Heretofore the Federal government has fostered the investigation and preservation of prehistoric treasures, but on the discovery of the great gold hoard at Monte Albán, the state of Oaxaca laid claim to sole right of exploitation. There can be no doubt that the decision is in the best interests of Mexican archaeology, since the states have neither the experience nor interest in conserving their heritage.

The remains of seven members of the Neanderthal race of 50,000 years ago were uncovered in a cave on Mount Carmel, near Haifa, Palestine, by T. D. McCown. This discovery was made in early May, immediately on resuming excavation at the point at which last year the skeleton of a Neanderthal child was uncovered. One of the adult skeletons was found clasping to his breast a huge jaw of a wild boar. The importance of the discovery lies not only in the large number of skeletons found, but that the remains indicate that there was a local Palestinian variety of the Neanderthal race.

**THEORETICAL ETHNOLOGY AND LINGUISTICS.** The principal proponent of generalized culture-historical reconstruction in the United States is A. L. Kroeber. A recent paper (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 29, no. 4) offers a reconstruction of a highly complex ceremonial development, the Kuksu cult of central Californian tribes. After indicating the intricate growth of the major part of the complex on the spot, Kroeber proceeds to trace its ultimate origin to Pueblo rituals in the Southwest, hence ultimately to Mexico. The fact that no traces of similar rituals are found in the intervening span of 600 miles is passed over lightly. It is sufficient to insist that rituals of this order could not develop independently in central California and the Southwest to convince this author that necessarily one must be derived from the other. The unsatisfactory aspect of this quite hypothetical reconstruction is not only the absence of convincing evidence, but that the task is allowed to rest at this point. The problems of the discrimination of learned and innate elements of culture, the processes of acculturation, and the like, which Kroeber states elsewhere are fundamental in anthropological inquiry have been further and further ignored in his recent contributions.

Even so, Kroeber's formulation is to be preferred to that of E. M. Loeb, who in *The Western Kuksu Cult* (same series, 33, no. 1) offers another reconstruction of the same complex. Loeb's method is wholly architectonic: starting with the assumption that certain elements are necessarily archaic (boy's initiation, ghost representation, death and resurrection ceremony, etc.), others are then conjecturally derived (as of later date) from the Northwest Coast and Pueblo centres of ritualism. In contrast, Kroeber's scheme has the merit of being essentially empirical.

While it is an open question whether statistical methods have any real value in the solution of ethnological problems, various anthropologists have from time to time tried their hands at inventing new statistical devices. The latest offering by Driver and Kroeber (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 31, no. 4) presents several formulae for the *Quantitative Expression of Cultural Relationships*. Metrical measures are proposed to show the extent to which one culture or culture-complex resembles the comparable set of traits among another people. On the basis of the closeness of the measures historical reconstructions are formulated. It is doubtful that these mechanical devices will find any acceptance among anthropologists in general. Not only does such mathematical treatment lend a spurious air of accuracy to data which cannot be forced into statistical frame, but they ignore the fact that historical developments in culture are known to be exceedingly intricate. Further, the fundamental problems of the nature of culture growth are wholly lost sight of in this attempt to make history the be-all and end-all of anthropological research.

Much more to point is the question of the stability of native cultures involved in L. M. O'Neale's study of the attitude of northwest Californian basket weavers to their craft (same series, 32, no. 1). Basketry among the Yurok and Karok "is thoroughly molded by a compact body of established traditions"; a standardization which sets in when the craft is learned from the older generation. Technique, materials, forms, and proportions of baskets are all fixed within narrow limits. Individuality has its opportunity in the creation of designs, but even here the suitability of the design to the object it embellishes, the bare tolerance accorded novelties, and the very real technical difficulties in working out a new design in the particular basketry technique, all operate against individual initiative and change.

Some observations on racial abilities were made on western and central Australian natives by S. D. Porteus (*Psychology of a Primitive People*, New York). These are people who in the popular mind represent the very lowest stage of human development. "Summarizing the test results we may say that, considering their unfamiliarity with the test situation the aborigines' response to tests of prudence and planning capacity, discrimination of form and special relations in test material familiar to them was little if any inferior to that of whites. In tests scored on speed their performance rated low, mainly because working against time was contrary to their habit. In rote memory they were particularly deficient when the test was an auditory one, less deficient, but still very inferior, when it was visually presented. They are not unintelligent, but are certainly inadapted to a civilized environment." The last statement would be of great importance were it warranted by Porteus's experience, but it certainly is not.

The cooperative survey directed by the Committee on Research in Native American Languages continued through the year. A report by F. Boas summarizing the field investigations from 1927 to 1931 (*Science*, May 6, 1931) indicates that most of these concerned North American languages. Attention was necessarily given to those on the point of extinction, although it is recognized that investigations of dialectic differ-

entiation, within the larger language families, have most to offer linguistic science. During the current year field work was carried on among the Bella Coola (Brit. Col.) by S. Newman, Washo (Nevada) by W. Dyk, Maidu, Yuki, and Patwin (Calif.) by H. Uldall and P. Radin, Pawnee (Okla.) by A. Lesser and G. Weltfish, and Chitimacha (La.) by M. Swadesh.

Similar direction is being given linguistic investigations in Africa by the International Institute of African Languages and Cultures (London) under D. Westermann.

Among the larger publications on native languages should be noted A. G. Morice's *The Carrier Language* (Vienna), a Canadian Athapaskan tongue, and E. Sapir's *Southern Paiute, a Shoshonean Language of Utah* (*Proc. Amer. Acad. Arts Sci.*, 65). A useful classification of dialects and political divisions in central North America was provided by Lesser and Weltfish's *Composition of the Caddoan Linguistic Stock* (*Smithson. Misc. Coll.*, 87, no. 6).

PHYSICAL ANTHROPOLOGY AND PREHISTORY. That *Pithecanthropus erectus*, the ape-man of Java, is a true genus was confirmed by the recent discovery of three more thigh bones by E. Du Bois among the materials he discovered with the original *Pithecanthropus* remains in 1891. The original report described a single femur from which the erect posture of this ancient proto-human was inferred. The three new femora are identical with the first, thus not only confirming the inference, but disposing of the old arguments that the single original skeleton was that of an isolated aberrant type. During the year W. F. F. Openoorth and C. ter Haar announced the discovery in Java of remains of a race resembling the Neanderthal of Europe, which they named *Homo (Javanthropus) soloensis*. Du Bois has also stated that two other skulls found in Java suggest the origin of the Australian natives.

It was reported during the year that evidences of human handiwork had been found in the cave at Chou Kou Tien near Peking in which the early proto-human form Peking Man (*Sinanthropus*) was found in 1929 (Breuil: *L'Anthropologie*, 42, 1). These are fragments of charcoal together with worked pieces of quartz and bone. If it be established that *Sinanthropus* is an archaic type of human and that the geological level is early Pleistocene (Ice Age), this evidence will thrust the beginnings of human culture much further back, and assign them to an earlier human type, than has hitherto been believed. New skeletal finds in the same cave include small bones of the wrist, which are reported to be definitely human in character. In fact, G. E. Smith offers his opinion that even though *Sinanthropus* be regarded as having lived at an earlier date than Java Man (*Pithecanthropus*) or Piltown Man (*Boanthropus*), yet he was more nearly an ancestor of our own than either of these, his elders.

Controversy continued through the year over the significance of the Oldoway skeleton discovered in Tanganyika, east Africa, in 1913 by H. Reck. It has been claimed by L. S. B. Leakey (*Stone Age Cultures of Kenya Colony*, Cambridge) that the skeleton was as old as the Pluvial deposit (corresponding to the Ice Age of Europe) in which it was found. Objection was raised that the skeleton would not have been articulated were it an original component of the water-borne gravels. Leakey admitted the remains were probably a burial on the spot, but insisted that the

superimposed strata were also Pluvial. Doubt was thereupon expressed that the stratum in which it was imbedded was significantly older than the higher levels (see *Nature*, v. 129 and 130). Early in the year Leakey reported finding a human jaw bone and three skulls with tools of European Chellean type in a fossil bed near Lake Victoria, not far from the Oldoway site. Their bearing on the original find is not clear.

The uncovering of a group of Neanderthal skeletons in the Cave of the Kids on Mount Carmel, Palestine, by T. D. McCown was hailed as one of the most important discoveries of fossil man yet made. In early May seven complete adult skeletons were found in the cave, immediately adjoining the child's skeleton discovered by McCown last year, and associated with industrial remains of the Mousterian culture epoch. At the close of the year D. Garrod discovered another adult skeleton in the Cave of the Oven at the foot of Mount Carmel. G. G. MacCurdy writes, "The specimens [of Neanderthal race] hitherto found in Europe have been so few and fragmentary that there was little evidence to suggest that the race or species might include a number of varieties. . . . The seven individuals just found . . . will, on account of their relative completeness, throw new light not only on the species as a whole, but also point to a Palestinian variety of the Neanderthal species." They differ from the European examples in that prognathism is confined largely to the upper jaw, the chin is not so receding, dentition is different, and the frontal and parietal portions of the skull are more highly developed (*Science*, June 17, December 23).

A revision of the relation of man to the primates was implied in the view of G. S. Miller (*Smithson. Misc. Coll.*, 85, no. 10) that human hairlessness is not the result of specialized development, but represents a probable survival of an ancient primate pattern. It is commonly assumed that human hairlessness, grayness, baldness, etc., are the result of artificial covering of the body. While the human hair pattern (i.e., distribution) is not exactly duplicated in other primates, all the elements can be found among them. For example, a partially denuded forehead appears in Celebean macaques, and a full form in the orang; most non-human primates have a bare area around the mouth, but the orang and the African guenon are definitely bearded like certain modern human races.

On the subject of racial differences F. G. Benedict concludes that there is positive evidence of a *Racial Element in Human Metabolism* (*Amer. Jour. Phys. Anth.*, 16, 463). The Maya of Yucatan were found to have a basal metabolism above the standard of Caucasians, with Australians, Tamils (Madras), and Chinese women below that standard.

A study of *The Anthropometry of the American Negro* by M. J. Herskovits (*Columbia Univ. Publ. Anth.*, 11) shows that the long continued crossing of whites and negroes has been arrested. A type is evolving which is relatively homogeneous. One partial factor is a strong tendency for dark men to marry light women. "This serves to set up a mechanism which, if continued, will bring about more Negroid features for this type in the future."

ETHNOGRAPHY. Relatively little significant or comprehensive work appeared in the investigations of Old World natives. Nevertheless, publication of briefer reports was brisk and will by

mere accumulation prove their value in the future.

The ethnographic survey of Polynesia undertaken by the Bishop Museum (Honolulu) has now reached the point where attention is directed to the smaller outlying islands. Such is T. R. Hiroa's *Ethnology of Tongareva* (Penrhyn Is.), an atoll northeast of Tahiti. At the same time more detailed information is appearing from the major groups. For example, E. S. C. Handy covers the topics *Houses, Boats, and Fishing in the Society Islands* (*Bull. Bishop Mus.*, 90) which are, of course, far from trivial concerns in the life of these islanders. A grammar and dictionary of the Marquesan language was published by R. I. Dordillon (Institut d'Ethnologie, Paris).

A good summary of the *Ethnology of Melanesia* (*Field Mus. Guide*, 5) by A. B. Lewis gives adequate attention to material existence. A special study of *The Sorcerers of Dobu* (London), an island of the D'Entrecasteaux group in western Melanesia, was made by R. F. Fortune and a systematic treatment of the distribution of certain forms of weapons in Melanesia was made by F. Speiser (*Zeitschrift für Ethnologie*, 1932, 74). From adjacent New Guinea, G. Bateson reported on the *Social Structure of the Iatmul People of the Sepik River* (*Occana*, 2, 245, 401). An account of the *Neo-Calédoniens* (Institut d'Ethnologie) was furnished by M. Leenhardt.

Activities originally engendered by the Australian National Research Council are now bearing fruit. There appeared a number of reports on Australian natives, especially on their social organization: e.g., on the Kimberley Division (n. w. Australia) and the Worimi, a Kattang people of New South Wales by A. P. Elkin, and on the totemic system of the Karadjeri tribe by R. Piddington.

Dutch anthropologists continued to proliferate material on the East Indies. Publications of the year were by Adriani on the Toradja (central Celebes), by Korn on customary law of Bali, by Ypes on inter-tribal relations of Tobo- and Dairi-Bataks (Sumatra). An account of the native industries of Java, Madura, Bali and Lombok was issued by the Java-Institute, Batavia. C. von Furer-Haimendorf offered material on the social organization of the Nagas of Assam (*Zeitschrift für Ethnologie*, 1932, 8) and B. Markowski on *Die materielle Kultur des Kabulgebietes* (Leipzig) in Afghanistan.

New African material is available from several localities. To his earlier account of the peoples of Ashanti (west Africa) proper, R. S. Rattray added a lengthy description of *The Tribes of the Ashanti Hunterland* (London). Several accounts of Congo natives appeared: one on the Bandas of the Ubangi-Shari by P. Daigre, another on the Bene-Nsamba, a Baluba group of the Katanga district (*Anthropos*, 27, 153, 525); a third by P. Schebesta on *Hambuti*: pygmies of the Congo (Leipzig). From farther north, J. F. Crazzolara published on the Shilluk of the upper Nile (*Anthropos*, 27, 183) and A. H. Bernatzik on Portuguese Guinea (*Aethiopen des Westens*, Vienna).

The problem of the antiquity of man in America continues a hardy perennial. This year provided its quota of reputedly ancient human remains, but as usual all the cases must be carefully sifted before they can be accepted. Near Clovis, New Mexico, arrowpoints were found in the vicinity of varied fossil remains, including the

mammoth. It is considered significant these were of the type found at nearby Folsom, where they occurred among the remains of an extinct species of bison. At Flagler Beach, Florida, an arrow-point was found underneath a mammoth jaw, with other artifacts a few feet distant (*Science*, May 13, 516; Nov. 25). Three finds of arrow-points with fossil remains of *Bison occidentalis* and mammoth, both extinct forms of Pleistocene age, have been reported from Nebraska. The association seems clear, but the age of the beds in which they occurred is in doubt (*Nature*, July 16, 87; July 30, 181). The most interesting find was that of a human skeleton lying beneath twelve feet of varved silt in the bed of the now extinct glacial Lake Agassiz in Ottertail county, Minnesota. The silting evidently took place at an early stage in the lake's history. A. E. Jenks reports that the skeleton is proto-Eskimo. With it were found an antler dagger and a shell pendant (*Science*, June 10, 607).

Stratified remains which bear on this question were reported at Signal Butte, western Nebraska, by the Bureau of American Ethnology. W. D. Strong found on the mesa top "three levels of human occupation separated in each case by some two feet of barren aeolian deposit. The uppermost occupation is prehistoric and contains pottery and artifact types suggesting some definite connection with the upper Republican culture of central Nebraska. The middle level is quite definite but thin: pottery is absent. The lowest level is thick, consisting of a series of open hearths and cache pits dug down into the underlying sand and gravel. Bone and chipped stone artifacts are abundant, polished stone rare, and pottery totally absent. The most abundant type of stone projectile points in the lowest level, while smaller, are of the same general form as those which have been found with extinct mammals in Nebraska. The lowest occupation level rests on water borne material laid down when the butte was still connected with the main escarpment to the south. Whether a time break occurs between the water borne materials and the earliest human occupation remains to be determined, but an early post Pleistocene dating for this horizon seems probable."

Works on the living tribes of the northern half of the continent have been relatively few during the year. A needed summary of *The Indians of Canada* (Ottawa) was published by D. Jenness. F. Boas added *The Religion of the Kwakiutl* of British Columbia (*Columbia Univ. Publ. Anth.*), given wholly in the form of statements of the natives, recorded in the vernacular. It was announced that F. de Laguna had found evidences of the ancient extension of the Alaskan Eskimo as far south as Cook's Inlet in a region occupied in historic times by Indians.

The investigation of the distribution of elements of native culture in eastern United States was continued by J. Cooper and R. Flannery, who report that most of the area east of the Mississippi has now been covered. Rituals of the Delaware (N. J.) and Fox (Ill.) were described by F. Speck and T. Michelson. Precise information on the tribes of the southern United States was augmented by J. R. Swanton's *The Social and Ceremonial Life of the Choctaw Indians of Mississippi* (*Bull., Bur. Amer. Ethnol.*, 103).

A possible time scale for the archeology of east central United States on the basis of prehistoric climates was suggested by P. B. Sears

(*Amer. Anth.*, 34,610). Interpreting pollens found in peat bogs as indicative of the flora of various periods and hence of the climate, after the method of Swedish botanists, he finds that in post-glacial times there has been a series of climatic shifts. These were successively, cold humid, cool dry (about 8000 years ago), humid (6-5000), warm dry (3000), transition (2-1000), present more humid climate. These agree fairly well with the prehistoric climates of northern Europe both in sequence and antiquity. Primitive cultivation of corn would thus have been possible in the Ohio valley through the last six thousand years, with optimum conditions in the warm dry period of roughly three thousand years ago. Coincidentally semi-steppe conditions made their appearance in the Western prairies, rendering corn cultivation impossible there. This scheme offers possibilities of assigning the successive prehistoric cultures now known in the Ohio valley to the several climatic periods.

A number of valuable ethnographic accounts go far to fill the gaps remaining in the survey of the Pacific States. Among them I. T. Kelley's *Surprise Valley Paiute* (n.e. Calif.) prove to have definite linkage with their Nevada relatives. A brief set of notes on the Tolowa (*Amer. Anth.*, 34) round out our knowledge of the northwest Californian type of culture. From the lower Sacramento valley is A. L. Kroeber's account of *The Patwin and their Neighbors*, heretofore poorly represented in reports. E. W. Gifford's *North Fork Mono* are a local Shoshonean group of the eastern foothills of the San Joaquin valley. From still further south appeared C. D. Forde's description of *Yuma Ethnography* (lower Colorado River). E. W. Gifford also published an account of *The Southeastern Yavapai*, linguistic relatives of the Yuma but occupying the mountains of central Arizona where they were subject to Apache influence (*Univ. Calif. Pub. Amer. Arch. Ethn.*, vols. 28, 29, 31).

Despite more or less systemic investigations among the pueblos of New Mexico and Arizona for 50 years, it is only at this late date that specific information is available on agriculture and land ownership. Among the most westerly group, the Hopi, C. D. Forde (*Jour. Roy. Anth. Inst.*, 61, 357) found this basic economy was essentially a male occupation, although the ownership of land rests with the matrilineal clans. That is, fields within the clan plots descend from mother to daughter whose husbands and sons are the cultivators. This parallels feminine ownership and transmission of houses. Some conflict with orthodoxy is found in the recurrent practice of men transmitting lands to relatives within their own clans.

The earliest date definitely assigned to a pueblo ruin is 797 A.D. This is the date at which a beam in a pit house was cut, according to F. H. Roberts. While inferentially many small ruins of the Southwest are earlier, this dating proves this archaic type of Pueblo ruin much closer to the known dates of true Pueblo ruins (the earliest of which are 861 A.D.-919 A.D.) than was believed.

Since many interpretations of North American Indian cultures rest on assumed connections with ancient Mexico, the well-nigh complete absence of information from northern Mexico has been a real handicap. R. L. Beals has now provided a *Comparative Ethnology of Northern Mexico Before 1750* (*Ibero-Americana*, 2), based on histori-

cal documents. In view of the disappearance of most of the native tribes little more can be expected from this quarter. Dealing with the same region Sauer and Brand described *Prehistoric Settlements of Sonora* (Berkeley, Calif.) with special reference to the terraced, entrenched hill structures.

One of the most impressive discoveries of relics ever made in pre-Columbian Mexico was that of a treasure-filled tomb at Monte Albán, Oaxaca. The first find, announced in January, was that of 10 Mixtec chiefs in a burial chamber originally erected by the Zapotecs, joint occupants of Oaxaca with the Mixtecs. Heaped over the bodies were cups and vases of jade, onyx, and rock crystal, with personal ornaments and utensils of gold. Many of these, as well as one skull, had been elaborately inlaid with turquoise. Numerous intricately carved bone objects were also part of the hoard. Other important additions to the Monte Albán collections were discovered throughout the year. According to the discoverer, A. Caso, the remains probably date from not long prior to the Spanish conquest. The scientific importance of the find lies in its addition to our scanty knowledge of the Mixtecs (*National Geog. Mag.*, Oct., 1932, 487).

The archaeological studies by the Carnegie Institution of Washington in Yucatan include the clearing of ruins at Chichen Itzá. An expedition to Calakmul, south-central Campeche, "brought knowledge of a very large, strategically located and hieroglyphically very fully documented Old Empire city." Excavations at Uaxatun, n. Peten, Guatemala, proved highly important in the discovery of much needed deposits of stratified refuse, on the basis of which the history of ceramic types can be unraveled. Attention was also given to allied ruins of the Guatemalan highlands. Ethnological studies were directed to the two extreme situations in Yucatan, at the wholly native village of Chan Kom and the modern city of Merida, for the purpose of discovering how modern civilization penetrates these Mayan communities. The medical survey concerned itself with studies of the incidence of tropical diseases and with investigations of basal metabolism (referred to above) and nutrition.

Importance attaches to J. E. Thompson's *Archaeological Investigations in the Southern Cayo District, British Honduras* because it is concerned not so much with the monumental ruins usually exploited in Central America, but with much needed evidences on domestic life (*Field Mus. Nat. Hist.*, Publ., 301). The same author with T. Gann presented a survey of this general field in *The History of the Maya* (London).

A brief *Ethnographical Survey of the Miskito and Sumu Indians of Honduras and Nicaragua* by E. Conzemius (*Bull., Bur. Amer. Ethnol.*, 106) was concerned primarily with the material life of these Central American peoples. Serviceable data on the *Indians of the Paraná Delta, Argentina* by combining archaeological with historical investigations was furnished by S. K. Lothrop (*Annals N. Y. Acad. Sci.*, 33, 77). R. Karsten published an account of the *Indian Tribes of the Argentine and Bolivian Chaco*.

*The Origin of Indian Civilization in South America* (Göteborg) lies in special developments from that basic, rudimentary culture which the first Indian immigrants brought to the continent, according to E. Nordenskiöld. The groundwork

still remains intact in the extremities of both Americas and in a somewhat modified form in the Gran Chaco and southern United States. If any of the higher civilizations of Middle America received an impetus from Oceania, as is commonly held and which Nordenskiöld doubts, that influence must be exceedingly ancient. It seems rather that the Andean and Central American civilizations have been reared on a common basis, largely in parallel but with a good deal of mutual influence. Central American influence on Peru lies very far back in time, while Peruvian influence to the north must be of late date. Nordenskiöld's interpretation brings an authoritative statement on what has for so long been an ethnographic "dark continent." With respect to Oceanic connections, R. B. Dixon makes a reasonably convincing case for the introduction of an important food plant, the sweet-potato, into Polynesia and eastern Melanesia in pre-Columbian times (*Amer. Anth.* 34, 40), since botanists place its origin in Central or South America. J. Tello has also recently discovered evidence of the great antiquity of this plant in Peru. Dixon is noncommittal as to whether it was carried westward by Indians or brought back by Polynesian voyagers to the New World.

**EXPEDITIONS.** The Göteborgs Museum (Sweden) reported expeditions to the Rio Juruá, South America, by C. Nimuendajú and to the Cuna of Panama by R. Pérez Kantule. The expedition of S. Hedin in China for the Naturhistoriska Riksmuseet (Stockholm) was completed this year, while S. Linné excavated a Toltec ruin at San Juan Teotihuacan, Mexico. Archaeological investigations on the southeastern Greenland coast by the Danes K. Rasmussen and T. Mathiasen and between Scoresby Sound and Ammassalik by E. Mikkelsen were reported. For the Koloniaal Instituut (Amsterdam) H. J. T. Bijlmer collected skulls in New Guinea and made anthropometric studies of the natives of southwest New Guinea and Halmahera. The University Museum (Cambridge, England) reports expeditions in India, Malaya, Siam, the Oceanic islands, Tanganyika, Natal, and West Africa. The Staatliches Museum für Völkerkunde (Berlin) sent F. Lessing to China and G. Waldschmidt to Further India. The Anthropos group (Vienna) supported ethnographic investigations by Bernatzik in the southeastern Solomon Islands, Lukas in Nigeria, Nadel in the western Congo, and Wölfel in the Canary Islands. L. Cipriani of the Museo Nazionale di Antropologia (Florence) made an expedition to the Taureg and Tebu of the Sahara. The Institut d'Ethnologie (Paris) reports studies on nomadism in Syria by Weulersse; in Africa on the Peul of Senegal by Gaden and by the Dakar-Djibouti expedition in Erythrea, in the Sanga region, and the Cameroons; in the Malay States among Negritos and maritime peoples by Cuisinier; in Bolivia by Dijour; and among the Guayaki of Paraguay by Velard.

The University Museum (Philadelphia) had a dozen field expeditions. Most of those in the Old World were concerned with Near Eastern archaeology: at Ur; Assyrian remains at Tell Billah and Tepe Gawra, Iraq; in Persia; at Beisan (Palestine), Meydum (Egypt), Lapithos (Cyprus), Minturo (Italy), with another in southeastern China. In the New World expeditions were dispatched to the Matto Grosso (Brazil), Piedras Negras (Guatemala), New Mexico, and Cook's Inlet (Alaska). For the University of Pennsylvania,

F. Speck visited the Delaware (Ontario and Okla.) and the Montagnais of Lake St. John, Quebec: A. I. Hallowell visited the Saulteaux of Berens River, Quebec. Archaeological studies by the American Museum of Natural History (New York) were made by W. C. Bennett at Tiahuanao, Bolivia, and Maracay, Venezuela; by G. C. Vaillant in the Valley of Mexico; and by J. Bird in shell-heaps of Tierra del Fuego. Ethnological studies in New Guinea were made by M. Mead, among the Pueblos (New Mexico) by C. Wissler, with anthropometric investigations in Assam and Burma by P. Mitra, and a study of race mixture in Hawaii, Japan, and China by H. Shapiro. The Museum of the American Indian (New York) undertook archaeological work in Honduras (G. Mason), Cape York, Greenland (J. Bird), in New York and New Jersey (Coffin and Turbyfill), and Cuba (R. R. Bennett), with ethnological work in Alaska (G. T. Emmons). Columbia University sponsored investigations of rituals among Navaho (New Mexico) by G. Reichard and Tsimshian (Brit. Col.) by V. Garfield; ethnology of Papago (Arizona) by R. Underhill, Lake of the Woods Ojibway by R. Landes, Western Dakota by E. Deloria, in Guatemala by R. Bunzel, Botocudo (Brazil) by J. Blumensohn, and Baganda (East Africa) by M. Mandelbaum. G. Wagner completed work on the Yuchi language (Okla.) and O. Klineberg continued investigations of selective migration. Ethnological field work of Yale University included investigations among the Tenina (Alaska) by C. B. Osgood, among Haida (Brit. Col.) by G. P. Murdock, Karok (Calif.) by V. McConnell, Canadian Sioux by S. Mekeel, and Maricopa (Arizona) by L. Spier.

Investigations of the Peabody Museum, Harvard University, include archaeological studies of Pueblo ruins in southeastern Utah by J. O. Brew, of Neolithic and later sites in Yugoslavia by V. J. Fewkes and in County West Meath, Ireland, by Hencken and Movius. Ethnological expeditions were made by F. Johnson to the Guaimi of Chiriqui, Panama, and by G. T. Bowles to western China and eastern Tibet. Anthropometric investigations were made by Erich in Montenegro. The University of Michigan had V. H. Jones collecting ethnobotanical data in the Pueblos and ethnographic work by M. R. Gilmore among the Arikara (North Dakota) and L. White among the Hopi (Arizona).

At Washington the Bureau of American Ethnology prosecuted archaeological work under F. H. H. Roberts in ruins of Pueblo I and II types at Allantown, Arizona; under W. D. Strong in Nebraska (cited above) and in Arikara villages at the mouth of the Grand River, South Dakota; under W. M. Walker in mounds at Jonesville, La. Ethnological studies were made by M. W. Stirling among the Jivaro of Ecuador, by J. P. Harrington among the nearly extinct tribes of southern California, by J. N. B. Hewitt among the Iroquois of Ontario. T. Michelson continued linguistic research among Cheyenne and Fox (Okla.). The U. S. National Museum had two expeditions to Alaska: A. Hrdlicka collecting in prehistoric sites on Kodiak Island and J. A. Ford at Point Barrow. Other archaeological investigations were made by F. M. Setzler in caves near Alpine, Texas; H. W. Krieger in Cuba; and J. T. Russell in caves of the Pyrenees. The Catholic University of America supported the ethnological work of J. M. Cooper among the Algonkians about James Bay, n. Canada.

Ethnological activities of the University of Chicago included investigation of social organization of the Winnebago and Sauk-Fox (Wisconsin) by R. Commons and S. Tax, of ritual and language of Navaho and Apache (New Mexico) by B. Haile and H. Hoijer, of economic life of Tlingit (Alaska) by K. Oberg, of acculturation and linguistics in Yucatan by R. Redfield and M. Andrade, of Chorti ethnology (Guatemala) by C. Wisdom. Archaeological work was continued in Illinois under T. Deuel and on the upper Mississippi by F. Cole. The Field Museum (Chicago) reports a joint expedition with Oxford University to the ruins of Kish, Mesopotamia, where early Sumerian and Sassanian remains were found.

In their local field (Washington and Oregon) the University of Washington sponsored studies of social organization among the Moses-Columbia by L. V. W. Walters, of general ethnography of Umatilla and Walula and of Cayuse language by V. F. Ray, and Coos ethnography by M. Jacobs. Ethnological field work of the University of California included E. W. Gifford among the North-eastern Yavapai (Arizona), I. Kelley among Southern Paiute (Utah), and in California among the Kern River Shoshoneans by E. W. Voegelin, Wappo by H. Driver, and a study of the 1870 Ghost Dance by C. Du Bois. Linguistic studies of the Kern River Shoshoneans and the Crow (Montana) were made by C. Voegelin and R. H. Lowie. The Southwest Museum (Los Angeles) reports archaeological investigations in the southern Californian desert by W. H. Campbell and in caves of White Pine county, Nevada by M. R. Harrington. Navaho (New Mexico) weaving was studied by C. Amsden.

**NECROLOGY.** Baron Erland Nordenskiöld of Göteborg, Sweden, who died July 5 (aged 54), was the foremost anthropologist in the South American field. Apart from explorations in the Argentine Chaco, Bolivia, and Panama, he was concerned largely with the collation of data from the whole continent, especially its material culture. To him is owing the only appreciable ordering of the chaos of this ethnological "dark continent." Sir Everard im Thurn, whose name is associated with the same continent, died October 8, aged 80. He served as Governor of Ceylon and Fiji after extensive explorations in British Guiana. John Roscoe, an English missionary who produced the standard accounts of the Baganda and kindred peoples of East Africa, died December 5, aged 61. R. R. Schuller, known for his work in Central America, died at Barranquilla, Colombia, January 18. Two American losses of the year were Francis La Flesche, himself an Omaha Indian, noted for his investigations of the Omaha and Osage tribes (September 5, aged 75), and Daniel Folkmar, responsible for the racial classification of the Immigration and Census Bureaus (July 21, aged 71).

**ANTIGUA.** See LEEWARD ISLANDS.

**ANTIOCH COLLEGE.** A nonsectarian coeducational institution in Yellow Springs, Ohio, founded by Horace Mann in 1853 and reorganized in 1920 by Arthur E. Morgan with the aim of embodying anew the educational philosophy of its first president. The number of students enrolled for the fall of 1932 was 548, of whom 354 were men and 194 women. The faculty for 1932-33 numbered 99. The productive funds of the institution amounted to \$206,529, and the operating income for the year was \$350,684. The

library contained approximately 39,771 volumes. President, Arthur E. Morgan, D.Sc.

**ANTIQUES.** See **ART SALES.**

**ANTI-SALOON LEAGUE OF AMERICA.**

A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. Its object, as stated in its constitution, is the extermination of the beverage liquor traffic, and it is pledged to avoid affiliation with any political party as such, maintaining an attitude of neutrality on all questions of public policy not directly concerned with the traffic in strong drink.

The League was established in 1895 by a coalition of the Anti-Saloon League of four States and the District of Columbia. At the end of 1932 it embraced 48 State or territorial Leagues and had affiliation with 45 other national temperance organizations, as well as with the World League Against Alcoholism (q.v.).

During 1932 the work of the League, which was conducted by more than 2000 representatives, included a widespread educational campaign on the evils of the use of alcohol and the duty of observance of the law, carried on through the press, the pulpit, the lecture platform, by radio and the drama. Its legislative programme comprised the presentation of testimony at hearings before Congressional committees on bills relating to prohibition, its enforcement, or its modification. None of these various measures was enacted except an amendment to the Revenue Bill to tax malt, wort and grape concentrates.

The League issued statistics, based on official reports, demonstrating that consumption of intoxicants had dropped to a small fraction of its former total and giving the consequent economic, social, moral and physical benefits of prohibition to the people of the nation. The League centred its activities on the organization of local and State groups for the encouragement of enforcement authorities and to secure the support of popular opinion for prohibition. In addition to many thousands of leaflets, documents and books distributed, it published *The American Issue*, in Westerville, O., with a monthly circulation of about 1,000,000 copies and with State editions in 22 States.

The officers of the League in 1932 were: President, Bishop E. G. Richardson, Philadelphia, Pa.; secretary, S. E. Nicholson, Media, Pa.; honorary treasurer, Foster Copeland, Columbus, O., treasurer, H. B. Sowers, Westerville, O.; general superintendent, Dr. F. Scott McBride, Washington, D. C.; director of the department of education, Dr. Ernest H. Cherrington, Washington, D. C.; attorney, Edward B. Dunford, Washington, D. C.

**AQUEDUCTS.** With the ever increasing demand for additional water supply for our great urban centres and the correspondingly increased cost of securing such supplies, it has become evident that groups of cities, rather than single cities, will undertake the great aqueduct constructions of the future. This movement toward the formation of "metropolitan water districts" has been growing in recent years. Boston early formed such a district; the Greater New York movement united several adjacent cities into a single water supply unit. More recently, thirteen cities have combined in the Colorado River

project. The recently organized State Water Policy Commission of New Jersey is planning for the future supply of proposed metropolitan districts, or areas, within that State. There is thus a well defined trend toward the consolidation of the water problem, and of economic resources to meet it, which is one of the most interesting developments in the field of public works which has occurred in many years.

In the domain of construction and design the ever-pressing need for economy, augmented by the current depression, has accelerated the development of welded pipe, and has turned attention to the need of providing protective coatings for steel pipe lines and even for the older and more durable cast iron mains.

Recent **YEAR BOOKS** have called attention to the four major aqueduct projects now under way or proposed. Of these, the Boston and San Francisco works are nearing completion; plans for a supply from the Western Catskills have been held up due to the financial difficulties in New York, and the Los Angeles project, authorized by a 5 to 1 vote on Sept. 29, 1931, has been made possible by action of the Reconstruction Finance Corporation.

The attention of hydraulic engineers throughout the world will undoubtedly be centred on the Colorado River-Los Angeles project for several years to come. It will be the longest aqueduct in the world, and, in the words of the *Western Construction News*, "Not since the Panama Canal has there been an hydraulic project to challenge the ingenuity of engineers or require such vast preliminary expenditure of human energy and money as the Colorado River Aqueduct."

**LOS ANGELES.** With no other adequate source of supply available and with the further development of the southern coastal plain of California absolutely dependent on an assured water supply, the Metropolitan Water District of Southern California has been planning for some nine years to go 239 miles to the turbid Colorado for supply. This great project, to take six years to build, to employ a maximum of 16,000 men, and to cost \$220,000,000 is now under construction. It is said that more than 150 possible routes have been studied in planning the line from the Colorado to the terminal storage reservoir which will serve the 13 cities of the Metropolitan District, of which Los Angeles is the largest. Over 40 distribution schemes have been analyzed in projecting the 157 miles of line required to distribute the supply over the area to be served.

Beginning at a point on the Colorado about 155 miles below the Hoover Dam, the water will be pumped, conveyed through grade conduit, tunnel, canal, and pressure pipe lines, across deserts, through mountains, and over valleys to furnish a supply of 969 million gallons daily (1500 cu. ft. per sec.). It is estimated that this will suffice for a population of 7½ millions, and, although the present population of the district is only 1½ millions, it is expected that the future growth and demand will require the full capacity of the aqueduct before the year 2000.

Although some of the vast preliminary road and power line constructions needed to reach the isolated area crossed by the aqueduct, was begun late in 1931, taxpayers' suits and financial difficulties hindered the sale of the authorized bonds and the future of the project seemed doubtful. The legality of the bond issue has since been established, however, and the pledge of the Re-

construction Finance Corporation to bid for a maximum of \$40,000,000 of the district bonds, assures the first two years of construction.

Calls for bids have been issued for the construction power line from the coast to the San Jacinto Tunnel, for a field headquarters at Banning, and for the San Jacinto Tunnel itself. This tunnel, for which a contract was signed at \$7,331,815 on December 12, will be almost 13 miles long (67,408 ft.) and 16 ft. in diameter. It is the first of three great tunnels (the West and East Coachella tunnels will follow) and it is proposed to excavate it from both headings and by two adits. As now planned the main aqueduct consists of 84.88 mi. of tunnel, 54.58 mi. of cut-and-cover aqueduct, 75.04 mi. of lined canal, and 24.52 mi. of concrete pipe. The total pumping lift of 1583 ft. is to be powered primarily from purchases from the Hoover Dam power plant but a small amount of power will be developed at drops on the aqueduct line itself.

Clearly the tunneling on this great work will be a controlling element of construction. Remembering the tunnel records made in the Roger's Pass and Cascade Tunnels (see 1928 YEAR BOOK) it will be interesting to note whether these remarkable records will be exceeded in the Colorado River aqueduct.

**SAN FRANCISCO.** Financial difficulties almost caused a shut down on the great Hetch Hetchy project early in the year. Bonds remained unsold and only a most extraordinary agreement between the forces engaged on the project and an emergency "Purchase Syndicate" avoided this calamity. Briefly, the syndicate bought the city bonds (\$1,500,000  $4\frac{1}{2}$  per cent) at par and as required to meet the monthly pay rolls. The employees contributed 10 per cent of their wages to the syndicate thus making good the 10 per cent discount necessary to secure a market for the bonds.

As noted in the 1931 YEAR BOOK, an emergency pipe line was under construction to make the Hetch Hetchy water available before the completion of the Coast Range tunnels. It is understood that this line, and the completion of the  $47\frac{1}{2}$  mile San Joaquin siphon, have met the emergency brought on by the 1931 drought. The final \$6,500,000 bond issue required to complete the Coast Range Tunnels and thus finish the system, was authorized by a vote of 2 to 1 in May. Bids on June 6, showed that the city forces were lowest, and, although outside contracts are required for all works over one million in amount, this bid was accepted. City forces are therefore carrying forward the 6.3 miles of tunneling and the 16 miles of tunnel lining which still remain before this great undertaking will be fully completed.

**ARABIA.** A peninsula in southwestern Asia situated between the Red Sea and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian Desert and the Sinaitic Peninsula. Estimates of the population range from 4,000,000 to 7,500,000. The inhabitants represent every stage of transition from the purely nomadic Bedouin tribes, occupying a large part of the interior, to the well-developed civic life of the large towns. The divisions of Arabia are defined as follows:

**KINGDOM OF SAUDI ARABIA.** The Kingdom of Saudi Arabia was, on Sept. 27, 1932, the official name of the territory formerly known as

The Kingdom of the Hejaz and Nejd and its Dependencies. Ruler in 1932, King Abdul Aziz Ibn Saud.

Hejaz occupies the western coast of Arabia between Trans-Jordan on the north and Asir on the south, the latter boundary touching the coast at about  $20^{\circ}$  N. latitude. The estimated area is about 150,000 square miles, although the land frontiers have never been definitely defined, and the population, largely composed of nomads, is placed at from 800,000 to 1,000,000. The chief cities, with their estimated populations, are Mecca, the capital of the Hejaz and the holy city of Islam (85,000); Medina (30,000), site of Mohammed's tomb; and Jidda (25,000), the seaport for Mecca. Mecca is visited annually by about 100,000 Moslem pilgrims from abroad, who represent the chief source of revenue for the government. The standard gold currency is the pound sterling, which is equivalent to 10 riyals in native currency. Agriculture is confined to the mountain oases and valleys, which produce fruits, dates, and some cereals. Hides, wool, gum, and clarified butter are the leading Bedouin products. Some Arab horses are exported. Imports of the Hejaz are estimated at from \$13,000,000 to \$15,000,000 annually. The southern section of the railway from Amman, Trans-Jordan, to Medina, has been out of commission since 1925.

Nejd occupies the highland of Central Arabia, with an indefinite area and a population estimated at 3,000,000. Riyadh, the capital, and Hufuf have populations of about 30,000 each. Dates, wheat, barley, fruits, hides, wool, horses, and camels are the chief products.

The Nejd was governed in patriarchal fashion by the King, acting through Emir Saud, his eldest son, who resided at Riyadh as Viceroy. The Hejaz had a Constitution issued Aug. 29, 1926, which vested all administrative powers in the King. By a decree of Dec. 9, 1931, King Abdul Aziz created a Council of Ministers for the Hejaz, composed of a President, together with the Minister of Foreign Affairs, Minister of Finance, and a Minister of the Consultative Council. There were six Departments of State and advisory councils of notables and officials approved by the King, including a consultative legislative assembly at Mecca, municipal councils in Jidda and Medina, and numerous tribal councils.

**ASIR.** A province on the west coast between the Hejaz and Yemen, formerly ruled by the Idrisi dynasty but since 1926 a protectorate of the Kingdom of Saudi Arabia. Estimated population, 1,000,000; capital, Sabya. Under an agreement reached between the Idrisi and Ibn Saud, Asir was practically annexed to the Hejaz in 1930. A dispute between Ibn Saud and the Iman of Yemen concerning the frontier between Asir and Yemen was reported to have been settled by a general treaty concluded on Dec. 15, 1931.

**YEMEN.** The Imamate of Yemen is an independent Arab state occupying the Red Sea coast between Asir and the British protectorate of Aden. The area is about 75,000 square miles and the population between 2,000,000 and 3,000,000. Sana', the capital, has about 25,000 inhabitants. Barley, wheat, millet, coffee, and hides are the principal products and exports. Revenues total about \$5,000,000 annually. Ruling Imam in 1932, Yahya Hamid ed-Din, who succeeded his father Muhammad in 1904.

A highway about 200 miles long was under

construction between Sana' and Hodeida, a port on the Red Sea. From Hodeida for 50 miles in a northeasterly direction the highway passes the Tehama, a low coastal plain. Then for the next 150 miles it winds over a mountain range to Sana' (altitude about 7500 feet). A second highway was under construction from Hodeida to Sana' which will extend in a curve to the south of the straight line between the port and the capital, and so pass around the mountain range. Motor vehicles using the new highways were expected to make the trip in 10 hours, as against five to six days required by pack animals.

**THE HADRAMAUT.** A region of fertile valleys to the east of Aden protectorate, the greater part of which is ruled by the Sultan of Makalla. The territory is under loose British protection and control.

**OMAN.** An independent state occupying the coastal fringe of southeastern Arabia; under the protection of Great Britain. Area, about 82,000 square miles; population, estimated at 500,000, chiefly Arabs but with a considerable Negro element along the coast. Muscat, the capital, has about 10,000 inhabitants, most of whom are Negroes or Baluchis. Exports, consisting of dates, dried limes, pomegranates, and dried fish, are exchanged principally with India. In 1930-31 imports were valued at £282,478 and exports at £132,797. Revenues total approximately 800,000 rupees (the rupee averaged \$0.3369 in 1931) annually. The reigning Sultan in 1932 was Seyyid Sir Taimur bin Feisal, who succeeded to the throne Oct. 5, 1913.

**KUWAIT.** An Arab territory fringing the northwestern coast of the Persian Gulf, with an estimated population of 50,000. The Sheik, Ahmed ibn Jabir al Subah, is subsidized by the British government. Capital, Kuwait.

**BAHRAIN ISLANDS.** An island archipelago in the Persian Gulf 20 miles from the Arabian coast, having an area of 250 square miles and a population of 120,000 ruled by Sheik Hemad bin Isa al Khalifa; under British protection. The chief islands are Bahrain (27 miles long and 10 miles wide); Maharag (4 miles long and ½ mile wide); Sitra (3 miles long and 1 mile wide); Nebi Saleh (about 2 miles in circumference). Capital, Manama (population about 25,000). The islands are the centre of the pearl-fishing industry of the Persian Gulf.

For other Arab or partially Arab states, see also IRAQ, PALESTINE, TRANS-JORDAN, SYRIA, and ADEN.

**HISTORY.** Another of the periodic tribal rebellions against the King, Abdul Aziz, broke out toward the end of May, 1932, under the leadership of Sheik Ibn Rifada el Awad of the Billi tribe, who was driven into exile in 1925 upon the overthrow of King Hussein of the Hejaz. A number of tribes, discontented as a result of economic suffering caused by drought and the decline in the number of pilgrims visiting Mecca, joined the revolt. Their forces were crushed in an all-day battle on July 31. Ibn Rifada and about 360 of his adherents were reported killed. The British government strengthened its forces in Akaba as a result of Ibn Rifada's revolt. Akaba, a port on the Gulf of Akaba of strategic importance in the defense of the Suez Canal, was annexed to Trans-Jordan in 1925 after the British prevented its occupation by Ibn Saud. The latter was reported as determined to incorporate Akaba within his kingdom.

Further fighting was anticipated in Arabia as a result of King Abdul Aziz's reported declaration that he did not recognize the Balfour Declaration in favor of a Jewish national home in Palestine. Also, the powerful Ruallah tribe of Southern Syria decided to assist in overthrowing the Ibn Saud dynasty of the Kingdom of Saudi Arabia and placing a member of the Hashimite family—that of King Hussein—upon the throne. An official mission from the Saudi Arabia Kingdom, headed by Emir Feisal, second son of King Abdul Aziz, visited most of the capitals of Europe, including Moscow and London, in the spring of 1932.

**ARBITRATION, INTERNATIONAL.** For an account of the earlier treaties (1908-1930) see the NEW INTERNATIONAL YEAR BOOK for 1930, pp. 45-47.

In 1931 the United States signed a treaty with Switzerland that embraced the arbitration and conciliation provisions which, in respect of other countries, are each the subject of separate treaties. Negotiations have been initiated for similar arbitration treaties with, Great Britain, Japan, Persia, Siam, Spain, Turkey.

Likewise in 1928, conciliation treaties similar to the Bryan treaties, were signed on the part of the United States, with: Albania, Austria, Czechoslovakia, Finland, Germany, Lithuania, Poland. These treaties have become effective by exchange of ratifications. During 1929, conciliation treaties were concluded by the United States with: Belgium, Bulgaria, Egypt, Estonia, Ethiopia, Hungary, Luxemburg, Rumania, Yugoslavia. These have become effective by exchange of ratification.

During the year 1930, conciliation treaties were concluded by the United States with Greece and Latvia. Negotiations have been initiated for similar conciliation treaties with Japan, Persia, Siam, and Turkey.

The policy which the American Government entered upon in 1928, has been to conclude arbitration treaties with countries with which the United States had Bryan Peace Treaties, but no arbitration treaties in force, at that time, and to conclude both arbitration and conciliation treaties with countries with which the United States did not have a treaty of either character in force.

The United States is a party to the two conventions for the pacific settlement of international disputes, signed at The Hague on July 29, 1899, and Oct. 18, 1907, respectively, the first of which is in force between the United States and fourteen countries, and the second of which is in force between the United States and twenty-nine other countries. The United States is also a party to the convention for the limitation of force for the recovery of contract debts, signed at The Hague Oct. 18, 1907, to which twenty other countries are parties.

Guatemala, Honduras, Nicaragua, Costa Rica, and the United States, are parties to a convention for the establishment of international commissions of inquiry, signed at Washington on Feb. 7, 1923. The United States is also a party to the treaty to avoid or prevent conflicts between the American States, which provides for the establishment of international commissions of inquiry, and which was concluded and signed at the Fifth International Congress of American States on May 3, 1923. Seventeen countries have ratified or adhered to the treaty; Brazil, Chile,

Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Mexico, Panama, Paraguay, Peru, United States, Uruguay, Venezuela. This treaty is often called the Gondra treaty, in recognition of its principal author, a delegate from Paraguay.

On Jan. 5, 1929, a Pan American Arbitration treaty and a Pan American conciliation treaty were signed at Washington by Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, United States, Uruguay, Venezuela.

**WAR CLAIMS.** The War Claims Arbiter Under Settlement of War Claims Act of 1928 reported to the U. S. Secretary of the Treasury that the work of the arbitration had been completed and that, by virtue of two certifications of awards, the terms of office of the Arbiter and of the officers and employees appointed by the Arbiter had expired.

The two certifications were in the claim of Berlin-Karlsruher Industrie-Werke Aktiengesellschaft in Docket No. 316 and the claim of Pallas Apparte Gesellschaft m.b.H. the only claims of German nationals which were the subjects of awards pending before the Arbiter after the first certification of awards.

On Aug. 2, 1928, upon the expiration of the time limit for filing claims with the Arbiter, the docket included 1180 cases. Comprised in these 1180 cases were 105 claims for the value of ships, five claims for the value of personal property contained in ships, one claim on account of a radio station, and 1069 claims, involving approximately 6000 patents, 108 applications for patents, and 454 trade-marks. Under the first Arbiter, who took office on Apr. 3, 1928, there were dismissed on jurisdictional grounds eleven claims for the value of ships and 165 patent and trade-mark cases, and awards were entered under Section 6 in two patent cases totaling \$3100 as the basic amount for the two cases, which, with interest from July 2, 1921 to Dec. 31, 1928, both dates inclusive, as provided by the Act, amounted to \$4,262.72.

Therefore, when James W. Remick took office as War Arbiter, succeeding the late Edwin B. Parker on Jan. 13, 1930, there were pending 1004 cases which included 94 claims for the value of ships, 5 claims (one of which was subsequently dismissed) on account of personal property contained in ships, one claim for a radio station, and 904 patent claims, involving approximately 5000 patents and 100 applications for patents. Of the 904 patent claims, 423 were dismissed by the present Arbiter and awards entered in 481 patent claims as hereinafter described.

The Arbiter awarded, as the value under the Act of the 94 ships, \$74,243,000, of which \$53,994,909.09 was the basic amount and \$20,248,090.91 was the interest under the Act. One of the five claims for the value of personal property contained in ships was dismissed on jurisdictional grounds and awards were entered in the four remaining cases amounting to \$9933, of which \$7224 was the basic amount, and \$2709 was the interest under the Act. The grand total of the awards in favor of German nationals under Section 3 of the Act on account of the 94 ships and the four claims for personal property in ships amounted to \$74,252,933, of which \$54,-

002,183.09 represented the basic amount, and \$20,250,799.91 constituted the interest under the Act.

Awards in favor of German nationals were entered by Arbiter Remick pursuant to Section 3 in 313 cases involving 3788 patents, 34 applications for patents, and one radio station, in the basic amount of \$9,079,830 with interest of \$3,405,557.83, making a total of \$12,485,387.83. The sum total of awards to German nationals under Section 3 on account of ships, patents, and one radio station was \$86,738,320.83 including interest, which falls short of the \$100,000,000 maximum appropriation authorized by Congress under Section 3 by \$13,261,679.17.

Under Section 6 awards were made in favor of Austrian nationals in 138 dockets, involving 194 patents, in the basic amount of \$663,740, with interest amounting to \$248,947.94, making a total including interest of \$912,687.94. Awards were entered under Section 6 in favor of Hungarian nationals in 31 dockets, involving 30 patents, in the basic amount of \$39,125 with interest amounting to \$14,674.56, making a total including interest of \$53,799.56. The amounts of awards mentioned in the two preceding sentences include the two cases in which awards were made under Section 6 by the first Arbiter. One of these cases, involving two patents, resulted in a basic award in favor of an Austrian national in the sum of \$3000, with interest amounting to \$1125.21, making a total including interest of \$4125.21. The other case which involved one patent resulted in a basic award in favor of a Hungarian national in the sum of \$100, with interest amounting to \$37.51, making a total including interest of \$137.51. The total amount, including interest, awarded under Section 6 in favor of Austrian and Hungarian nationals is \$966,487.50, which falls short by \$33,512.50 of the maximum appropriation of \$1,000,000 authorized by Congress.

The expenditures made by the War Claims Arbiter from the beginning of the Arbitration on Apr. 3, 1928, to its close on Dec. 15, 1931, amounted to \$136,862. Pursuant to the allocation required by subsection (1) of Section 6 of the Act the Arbiter decided that 83 per cent of this amount should be borne by the German Special Deposit Account, 16 per cent by the Austrian Special Deposit Account, and 1 per cent by the Hungarian Special Deposit Account.

**GENERAL AND SPECIAL CLAIMS.** The U. S. Department of State reported that the only arbitrations now in progress (1932) are the general arbitration of the pending claims of the United States and Panama, and the arbitration of the claims of American citizens against the German government arising out of the World War. The arbitration of general and special claims against the government of Mexico which had been in progress since 1924 was suspended during the latter part of 1931 because of the expiration of the two Conventions between the United States and Mexico from which the respective arbitral commissions derived their jurisdiction.

The only arbitration convention which is now awaiting the approval of the United States Senate is the Special Claims Convention between the United States and Mexico extending the life of this Special Claims Commission. The approval of the Senate to the extension of the General Claims Commission between the United States

and Mexico was given in the form of a Senate resolution.

The status of the *I'm Alone* case was not materially changed during 1932. The United States counsel were awaiting the brief to be filed on behalf of Canada. See *NEW INTERNATIONAL YEAR BOOK*, 1930, p. 46.

Robert E. Olds, formerly Under Secretary of State was appointed a member of The Hague Arbitration Tribunal in succession to the late R. W. Bowyer.

The Anglo-German mixed arbitral tribunal was provisionally dissolved as of February 7, by exchange of notes between Germany and Great Britain.

The Mexican Senate approved the award of the King of Italy, in favor of France, dated Jan. 28, 1931 in the arbitration between France and Mexico over Clipperton Island.

The claims of the United States against Germany based on the *Black Tom* and *Kingsland* cases, and involving \$40,000,000 for alleged sabotage in the World War, was settled in favor of Germany by a decision of Associate Justice Owen D. Roberts of the U. S. Supreme Court, acting as umpire in the German-American Mixed Claims Commission.

Eugene Borel, Arbitrator in the United States—Sweden arbitration, rendered a decision in favor of the United States in a claim based on the alleged detention of two Swedish motorships by the United States during the World War.

The Court of Claims decided the case of *Flensburger Dampfer-Compagnie* (a steamship corporation operating under the laws of Prussia) versus the United States.

The report of Robert W. Boynge, American agent of the Mixed Claims Commission (U. S. and Germany) on claims from June 30, 1928—June 8, 1932, was published as Senate Document 146, Seventy-Second Congress, Second Session.

**ARBITRATION, LABOR.** See *LABOR ARBITRATION AND CONCILIATION*.

**ARBOR DAY.** See *CELEBRATIONS; FORESTRY*.

**ARCHÆOLOGICAL INSTITUTE OF AMERICA.** A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has largely accomplished its purpose through its schools and a number of important committees, including the American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Bagdad, the School of American Research in Santa Fe, N. M., the American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Medieval and Renaissance Studies. In 1932 it had 55 affiliated societies, or chapters, with a membership of 3425.

The thirty-third general meeting of the institute was held at Syracuse, N. Y. Dec. 28-30, 1932. In connection with its study of the Mythology of All Races, the institute published *Semitic Mythology*, by Stephen H. Langdon. The official organ is the *American Journal of Archæology*, a quarterly, while *Art and Archæology*, a non-technical monthly, is published by the institute's Washington society. The officers in 1932 were: President, Louis E. Lord, Oberlin College, Oberlin, Ohio; first vice president, David M. Robinson, Johns Hopkins University; general secre-

tary, Albert Billheimer, New York University; treasurer, Rollin H. Tanner, New York University; and recorder, Horace W. Wright, Lehigh University.

**ARCHÆOLOGY.** The last few years have shown a growing interest in the exploration of the ancient sites in Syria, Palestine, and Mesopotamia. The past year has been no exception to the rule. Egypt, Greece, and Italy have of course continued to receive considerable attention.

**EGYPT.** South of the great temple at Abou Simbel in Egypt the flight of steps which led down to a tomb were found covered with the skeletons of horses, camels and dogs which had been sacrificed at the funeral of the owner of the tomb. In another tomb were found the remains of four horses wearing elaborately silver-mounted harnesses. Nearby were the skeletons of four men whose manner of death was indicated by the ropes still found about the necks. In still another chamber were discovered the bones of forty-six dogs and a colt as well as those of a strangled groom.

Near Beni-Salame, 30 miles from Cairo, have been found the evidences of a neolithic settlement dating about 5000 years B.C. The people who lived here ate wild game such as the boar and gazelle but they also kept cattle and seemed to have developed agriculture to a fair degree, for threshing floors and storage bins were found. The houses took the form of oval clay huts half sunk in the ground. Entrance was through a hole in the top.

One of the most important discoveries at Gizeh was that the fourth pyramid which so much resembled a mastaba belonged to queen Khent-Kawes. The inscription on the door jamb of the chamber which was cut in the solid rock describes the queen as "King [perhaps Ruler] of Upper and Lower Egypt and mother of the King of Upper and Lower Egypt, daughter of the God." Nearby were uncovered a series of rock-cut burials which formed a street that ran out probably into the desert. The largest was that of queen Bunefer; the others were those of royal priests.

At Meydum has been found a relief portrait of king Seneferu who built the pyramid at this place. This is the only known contemporary likeness of this prince. In the 18th dynasty cemetery some 30 tombs were opened and were found generally to have a "T" shape with a rectangular pit and a small chamber at the bottom. One tomb contained vessels with eye-paint, alabaster jars and some Ægean ware of the late bronze age. . . . To the north of the pyramid lies a large Ptolemaic cemetery in which interments reaching down to Christian times were opened.

Interesting discoveries have been made at Tel el Amarna, the capital of the Pharaoh Ikhnaton, the so-called heretic king. Work was concentrated upon the great official buildings, namely the small temple called Hat Aten or "Castle of the Disk," the private palace of the king and the public or state palace. The two palaces were connected by a bridge in which was a window from which the king showed himself to his people. The private palace was surrounded by a garden in terraces approached from the north by a gateway which was flanked on either side by flower beds. It was from this garden that the bridge led to the state palace. In the eastern part of the house were magazines. In this part was found a fine sculptor's trial piece and a wooden ushabti case in which were the handles of two walking-sticks. These were in the form of human hands. Not the least interesting was the evidence

discovered which seems to indicate that toward the end of his career Ikhnaton made efforts to effect a reconciliation with the orthodox priesthood and that Nefertiti the queen stood out against this move and actually withdrew to her own palace. The inference to be drawn seems to be that she may have been the force which led the king into his monotheistic beliefs.

**SYRIA AND PALESTINE.** An interesting start was made this year by Americans in digging at Antioch. Here a fine floor mosaic of the second century of our era was uncovered. It showed a reclining figure of Dionysos stays and dancers, and another panel showing the Judgment of Paris.

At Beisan, ancient Beth-shan, diggings in the level of the time of Seti I uncovered a large building, controlling the way to the top of the tell, which was found to contain an inner hall and a group of narrow buildings on the north, east, and south sides. Excavations at Gaza, conducted by Sir Flinders Petrie, have brought to light three superposed palaces dating from the years 3100, 2300 and 2100 B.C. In the earliest building was found a bath lined with plaster and approached by steps. In a foundation deposit of the last palace was discovered the skeleton of a horse which had been sacrificed and parts eaten at the ceremony. From the palace a secret passage was found to lead out into the desert affording a way of escape in time of siege. In a cave on the western side of Mt. Carmel were uncovered the skeletons of three people of the Neanderthal type. The floor of the cave was covered with the bones of animals and Mousterian implements.

Excavations by Liverpool University at Jericho have brought to light undisturbed royal tombs, evidence from which indicates that these kings in the fifteenth century were subject to Egypt. The latest dated deposit is from the time of Amenhotep III. One tomb of the time of Thothmes III and Hatshepsut contained as many as five hundred vases.

Garstang, who has been working at the site of Jericho, suggests Hatshepsut as the princess who discovered the infant Moses. In other words, the tombs of the kings contain considerable pottery and scarabs which point to the time of the exodus as that of Hatshepsut.

Some four hundred yards west of the city 25 bronze age graves were opened. From them were obtained about 1500 objects of that period. It was discovered that in the middle bronze age, that is, about 2000 B.C., the site of Jericho was surrounded by a strong mud brick wall with the gate protected by a massive tower. About 1800 B.C. the city covered about twelve acres and contained about three thousand people. In the sixteenth century the place, which had flourished under the rule of the Hyksos kings, fell before the power of Egypt.

At Mizpah excavations have brought to light many Cypriote vases antedating the year 1000 B.C. showing that contact with the Mediterranean was close. The temple of the queen of heaven, mentioned in Jeremiah, was cleared out, giving the first well-preserved gate discovered in Palestine.

From Ras Shamra, in northern Syria, has been recovered in the necropolis, what is probably the earliest record of a financial crash. The information is supplied by a tablet which appears to be warrant for the arrest and extradition of the minister of finance who had apparently brought on the disaster by his misdeeds in office. The

king who had issued the warrant was, it seems, much incensed to learn that the offender had been allowed to go free on bail after his arrest.

Of especial interest is the discovery at Samaria that Ahab's "House of Ivory" was something more than a myth. In the palace were found ivory panels which might well have served as ornaments for the king's bed or the walls of the rooms. One fragment, about 4.5 cm. in height shows two crouching lions. Others show a decided Egyptian influence, combined with influences from Mesopotamia.

Excavations at Sechem have uncovered massive cyclopean walls with a tower gate having a tower at the four corners of the structure. The walls can be traced for an unbroken circuit of such an extent as to include a city of 15 acres. In a tomb discovered in the necropolis of Tell en-Nasbeh has been found a fine agate seal in the form of a human eye bearing on the back an inscription in old Hebrew characters which reads "Belonging to Jaazaniah, servant of the king." Below the inscription is a figure of a crowing cock. This Jaazaniah was one of the officers of king Jehoiakim's army at the time Nebuchadnezzar captured Jerusalem.

**MESOPOTAMIA.** Excavations conducted at Bagdad by the University Museum, Philadelphia, have revealed that the palace was dedicated to Shalmaneser, son of Ashurnasirpal. From the second stratum has been taken a tablet of the time of Tiglath Pileser I. This refers to goods shipped to Nineveh through a broker named Yakub.

In the throne room of the palace of Sargon at Khorsabad has been found a huge monolith base of the throne measuring 12 by 15 by 5 feet. Sculptures on the sides show the king triumphant. The throne base had two small flights of steps. In the palace were three temples; those of the Moon-god, the Sun-god and Ningal the wife of Sin the Moon-god.

At Nineveh the excavators have dug down to the virgin soil and as a result of their work have been able to establish five prehistoric periods by means of the pottery found at the different levels. The earliest which was coarse plain ware carrying incisions is placed not later than 5000 B.C.; the second shows brilliantly painted ware done in three colors with affiliations with the early pottery of Carchemish; the third was marked by infant burial urns of great polished ware and seal impressions of animals done with great delicacy; the fourth contained red slip ware and seal impressions dating about 4000 B.C.; the fifth dating about 3000 B.C. supplied wheel-made vases and Sumerian seal impressions.

At Nuzi, about 200 miles north of Babylon, has been found the oldest known map in the world. It dates about 2500 B.C. and is small enough to be held in the palm of the hand. Three points of the compass are indicated together with the garden land of a man named Azala. Place names, a river, and neighboring mountains are shown. At Persepolis a foundation document has been found which tells of the completion of the Hall of the Hundred Columns by Artaxerxes. Diggings have shown that the elaborate drainage system of the platform was carefully laid out before any of the buildings were erected.

Finds of great importance have been made at Tel Asmar, some 50 miles north of Bagdad, where pottery with figures of elephants, rhinoceroses and crocodiles were recovered. These creatures were unknown in Babylonia at this time, 2000

B.C., and it is argued that the objects must have come from the Indus valley thus establishing a connection between Mesopotamia and the East.

In ancient times the city of Tel Asmar, or rather, the city on that site was connected with the river by canals. The name of the place was Eshnunna. Explorations on the site have afforded information reaching from the third dynasty of Ur to the time of Hammurabi's conquest in the twentieth century. From some 1400 clay tablets found on the site it was discovered that the kings of Eshnunna were vassals of Ur at the time of the third dynasty.

At Tepe Gawra the University Museum of Philadelphia found a town dating from the fourth millennium B.C. The arrangement shows a carefully laid out plan with the streets grouped around a market place. To the north were the shrines, in the centre the citadel, and to the south the residential district. All the walls were decorated with offsets. The place dates about 3700 B.C. making it the oldest town known. From the third millennium comes a fine seal representing the marine abode of Ut-apeshtim, the Babylonian Noah.

Work has continued at Ur. On the outskirts of the pre-dynastic cemetery was found a grave the pit of which had been filled in at three different times. At the bottom level were found perfect traces in the clay of the coffin which had been constructed of reeds with a wooden frame. The roof was gabled. The date of the burial is a little before the time of Sargon of Akkad, 2630 B.C. Other work on this site has resulted in the clearing of the base of the ziggurat and the resulting clearing of buildings of the first dynasty. A very thick terrace wall of heavy, dressed stones enclosed a group of rooms built of mud bricks as to the walls and with beaten clay floors. The clearing away of a massive wall, under the temenos wall of Nebuchadnezzar, revealed a complete temple with its entrance hall, paved court and three sanctuaries. The front was decorated with the regulation vertical grooves seen in Mesopotamian architecture.

GREECE. The American school of Classical Studies has successfully conducted its second campaign on the site of the ancient agora. The work was carried on in four city blocks two of which had been attacked in the 1931 campaign. In the northern sector, which lies just under the Theseum, were found traces of the Royal Stoa, identification of which was confirmed by this year's digging. In this quarter was discovered a building which is thought to have been used by the administrative officers of the Stoa. In the second sector, which lies to the southeast of the first, was located a wide street with buildings on each side. A long building which appeared on the east has been tentatively called the Stoa of Zeus Eleutherios. During the course of the campaign were found several fine Greek sculptures the most beautiful of which is a bronze female head somewhat over life size. This was discovered in a well together with Megarian bowls and lamps of the early third century. Another was a marble statue of a woman reminding one, as to pose, of the Nereids of Xanthos. It dates not later than the early fourth. The third is the statue of Hadrian which was located last year. The pottery recovered covers a wide range of dates from Middle Helladic down. Not the least interesting of the finds was an inscribed fragment of pottery bearing the name Aristides and

referring to the famous person of that name who was ostracized. Another interesting discovery was that of a dicast's bronze identification ticket and a bronze disk used in voting.

The Germans have continued their work in the Ceramicus where they have found many inscriptions. One gives a list of the Argives who fell at Tanagra in 458 B.C. In the neighborhood of the Sacred Gate of Themistoclean times the gateway and the Eridanos enclosure have been laid bare. Besides this a pre-Mycenaean cemetery, which was discovered in 1927, has been examined and 24 burials opened. This dig disclosed that there was no break here between late Mycenaean and proto-geometric times, that is in the 11th-12th centuries.

At Perachora (Corinth) excavations have brought to light beautiful bronze vessels of the seventh and sixth centuries. At Corinth itself two marble heads of Roman date have come to light. One, that of a woman, wears a turreted crown and probably represents the city of Corinth.

The Swedes have been working at Agia Irini in Cyprus where they have found a cult place dating about 1200 B.C. Originally the place had an open area surrounded by a row of priests' houses. In the course of the centuries the site was modified. One change took place about 1000 B.C. although the god still continued to be represented by the bull. A second change occurred about 700 when a new altar was erected. In the neighborhood of 600 still another change was made. At this time the temenos was considerably enlarged. Many terra cotta figures were found on the site varying from 20 cm. to life size. In all there were about 2000. They were arranged in concentric rows around the altar.

Also at Vournos in Cyprus an American expedition, under Dr. B. H. Hill, has located a palace and many unusual ritualistic vases with plastic figures on them. Some of the scenes suggest analogies with Minoan hinting at the survival of cult practices. The same expedition opened a number of prehistoric and geometric tombs. These burials belong to the Middle Bronze age (c. 1800 B.C.). From one grave over 325 fine bronzes were taken. Mostly in perfect condition they include ax-heads, knives, swords, daggers, pins, needles, tweezers, and rings.

At Troy Americans, working under Professor Blegen and Professor Sempel, with the assistance of Dr. Doerpfeld, ended their first campaign July 1. Two untouched sites within the citadel were dug to a depth of 3 meters. The upper layers, of Roman date, represent Troy IX. Below this came two prehistoric levels one at a depth of 1.70 m. the other at 2.75. In the upper one of these were found parts of a four-roomed house in one room of which was a domed oven of crude brick. Remains of another house were found at the other level. It is possible that this house belongs in the late part of the fourth city while the other belongs in the fifth.

This year Prof. D. M. Robinson, of Johns Hopkins University, continued his important work on the site of Olynthus. The excavations were concentrated upon the residential area. Here the city was found to be laid out in a regular fashion with some 13 streets crossing three main avenues at right angles in the true Hippodamean fashion. The city blocks were found to be of exactly the same size (86.5 by 35.5 m.) each containing 10 houses. The houses are very important for the history of domestic architecture since they are

the only houses of the late fifth and early fourth centuries of any importance yet found. The general plan shows the rooms opening on several sides of a court with the more important facing the south to get the warmth of the winter sun. These buildings had a second story.

Not the least important of the finds here were several fine mosaics of colored pebbles which were used as floors. These were found generally in the *andron* which was the important part of the house. The designs include geometric patterns, combats, and fantastic creatures. That showing Bellerophon on Pegasus slaying the Chimæra is the earliest mosaic known to contain a mythological scene.

ITALY. At Anzio, the site of ancient Antium, has been found a fine Hermes of the first century A.D. and a sculpture showing an Amazon riding down a fallen Greek. At Ardea was found proof that the site was occupied from the Early Iron Age down to the second century B.C. At Cecina one of the most important Etruscan tombs has been discovered. It is circular with a vaulted ceiling about 7 feet in height with the centre supported by an octagonal column. A square vestibule leads into the circular part of the tomb.

Professor Maiuri believes that he has found at Cumæ the actual grotto of the Cumæan Sibyl. The cave consists of an excavated tunnel running north and south along the top of the hill. It is 20 feet in height and 10 in width at the level of the floor, and 40 feet in length. At regular intervals, on the side to the sea, are lateral tunnels cut through to the outside of the hill, thus admitting light. Half way along the main tunnel three more lead out to three pools in which the Sibyl bathed before giving her prophecies. The grotto terminates in a large room in which are three arched niches.

At Herculaneum two complete *insulae* have been cleared. On the eastern side these extend as far as the city limits. The houses found proved to be very fine, with verandas and terraces looking toward the sea. The supports for these terraces were strong buttresses resting on the native rock. On the sea front of the houses were rooms opening on the loggias where one could rest and view the sea. Two houses of this patrician type were found, one has been named the "House of the Mosaic Hall" the other the "House of the Stags." Among the more humble houses were discovered two-family dwellings with light partitions of frame and plaster.

At Lake Nemi the second ship of Caligula has been completely recovered. The vessel is 233 feet long and 79 wide, and has a gallery for 100-150 rowers on each side. This gallery is 15 feet wide amidships and 26 at each end. Because it has been more deeply buried in mud than its companion, this ship is better preserved. In the centre of the deck is a small temple. Near the second vessel was found also a small boat 33 feet long by 4 feet 8 inches wide.

The excavations at Ostia have brought to light a fragment of an ancient *Fasti Annales* which, in a way, corresponds to our modern newspapers. This one, from the time of Trajan, contains many laudatory references to his works, such as that on the Appian Way, his rebuilding of the temple of Venus Genetrix, and the dedication of his column.

In the "House of Menander" at Pompeii three skeletons were found in an upper room where they had been caught by the disaster of the year

79. The house has now been practically completely cleared, and in it was discovered, besides the bodies just mentioned, a cart, the iron fittings for which are almost intact.

In Rome the excavations have now laid bare the whole of the Basilica Ulpia and have also revealed a Greek and a Latin library which stood near the basilica. The shops near the forum of Julius Cæsar have been cleared. In front of them are the round bases for columns which supported a double aisled portico. In the forum itself the houses which stood in the west part have been removed revealing a narrow strip of pavement.

At Tivoli the villa of Horace has been completely excavated showing a building some 140 feet wide and 363 long. In it were 24 rooms, 3 swimming pools, hot, warm and cold baths, and a garden covering 2900 square yards.

GENERAL. At Zara in Dalmatia has been found the forum of Augustus. At the site of Heraclea, in France, in the delta of the Rhone, excavations have uncovered the ruins of many houses and streets. In Bubenac, a suburb of Prague, a Roman settlement of the first century of the Christian era has come to light. In the centre of the city of Tarragona, in Spain, a circus of Roman times has been found. At Barcombe Mills, near Lewes, in England, a perfect bit of Roman road has been uncovered. It was part of the main road from London to Lewes. At St. Albans, ancient Verulamium, a Roman house with mosaic floor showing the head of a sea god has been found.

**ARCHITECTS, THE AMERICAN INSTITUTE OF.** The national organization of the American architectural profession, founded in 1857. Its objects are to organize and unite in fellowship the architects of the United States; to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession and to make it of ever-increasing service to society; and to spread an understanding of art and service among the people.

Among the activities of the institute are devising methods, in coöperation with the architectural departments of the leading universities, for improving and extending architectural education not only in the universities but in the lower schools. It has perfected a model law for the registration of architects and assists its chapters in securing the enactment of proper registration laws in the various States. In collaboration with the Bureau of Standards, the American Engineering Standards Committee, the American Society for Testing Materials, the National Fire Protection Association, and similar organizations it has developed a service for architects which will give them for their actual problems data relative to building materials and data obtainable from no other source. It maintains a service to inform the prospective builder of the value of the architect's services from the æsthetic as well as the practical point of view.

The institute is governed by officers and a board of directors elected by, and responsible to, the delegates from the 67 chapters assembled at the annual convention. The directors and executive committee hold quarterly meetings in various parts of the United States, and the regional directors keep in active touch with the work of local chapters throughout the year. The membership in 1932 numbered more than 3400 of the 10,000 practicing architects in the United States.

The sixty-fifth annual convention, held in Washington, D. C., Apr. 27-29, 1932, reaffirmed

the stand taken by the 1931 convention that the operation of State, municipal, and other bureaus for the designing of buildings and monuments was an invasion of the field of individual professional activity and that these governments should discontinue as competitors in business with their private citizens. There was also urged by the retiring president, Robert D. Kohn, improvement of social conditions through large-scale housing operations. The officers elected for 1932-33 were: president, Ernest J. Russell of St. Louis, Mo.; first vice-president, Charles D. Maginnis of Boston, Mass.; second vice-president, Horace W. Peaslee of Washington; secretary, Frank C. Baldwin of Washington; treasurer, Edwin Bergstrom of Los Angeles, Calif.

The property maintenance capital of the institute in 1932 amounted to approximately \$73,000, the income being devoted to the maintenance of The Octagon, the historic colonial building owned by the institute. The organization's property and funds totaled \$507,019, of which \$53,817 belonged to the Waid Education Fund, the income being used to defray expenses of lecturers sent to various chapters and schools. The institute publishes *The Octagon, a Journal of the American Institute of Architects*; *Handbook on Architectural Practice*; *Autobiography of an Idea* and *A System of Architectural Ornament* by Louis H. Sullivan; *Bertran Grosvenor Goodhue—Architect and Master of Many Arts*; *Charleston, S. C.* (vol. i, Octagon Library of Early American Architecture); *Standard Contract Forms and Standard Filing System*; and documents on the ethics of the profession. Headquarters are in The Octagon, Washington, D. C.

**ARCHITECTURE.** Architecturally, the year 1932 was a disappointment. Depression conditions, almost world-wide, not only reduced building everywhere, but even in housing, the most socially necessary and promising field, compelled a drastic reexamination of the question, and in some cases a regrettable lowering of standards. Thus in Germany many municipalities, as well as the Prussian Government, began to experiment with "self-help" housing for the unemployed—mere shacks, often at scarcely decent subsistence levels, without plumbing or electricity. It is the plan to have these built largely by the unemployed themselves on agricultural land in a desperate attempt to make the unemployed self-supporting. It is noteworthy that in design the greater number return to old German traditional forms. Similarly, in America, the West Side Chamber of Commerce of New York City conducted an examination into what could actually be built to-day on American city land at its grossly inflated values, for the lower income groups, who cannot afford more than \$6.00 per month per room. The result, designed by Howard Burton, is a complete *reductio ad absurdum* of present conditions—a scheme of endless north-south rows of flats 20 feet apart, and 4 and 5 stories high. Such a scheme could not be better named than "How to create new slums"; yet without drastic governmental action it is all that is possible under the present system. Now the tragedy of such things as this proposal, or the German self-help housing is, that if built on a large scale, and if successful, they would constitute a definite turning back the clock, a definite abandonment of even the hope of a decent living standard on the part of those whose standard is low enough already.

**THE UNITED STATES.** The building industry of this country has suffered from the depression perhaps more severely than any other. In the first eight months of the year, for instance, according to Dodge Reports, total construction contracts were roughly \$929,800,000, as opposed to \$2,311,600,000 for the corresponding period of 1931, a decline of about 60 per cent! And of this amount nearly half consisted of roads, sewers, and similar projects. The large projects completed or carried on during the year, like Rockefeller City, New York, and the Century of Progress Exposition, Chicago, were begun or decided on prior to the depression. And the Government programme of public works has lagged disappointingly. The Reconstruction Finance Corporation has been so busy making "financial" loans to Banks, Railroads, and so on, that its loans to "self-liquidating projects" (of which much had been hoped, especially along housing lines) are as yet but scanty. Even the Hillside Housing Project in the Bronx, New York City, designed by Clarence S. Stein, which had been promised a large loan, aroused such discussion because of its effect on the local real-estate situation, that it is in a deadlock.

An important event during the year was the traveling exhibition of Modern Architecture, sponsored by the Museum of Modern Art in New York City. This lavish presentation by photographs and models was unfortunately not made inclusive; it was, with a few exceptions, limited to that class of stark functionalist designers who have created what they term "The International Style"—Le Corbusier, Miès Van der Rohe, Gropius, Howe, and Lescaze, etc. The exhibition thus became unduly propagandist in tone, rather than informative. The whole controversy with regard to the International Style, with its insistence upon lack of ornament, and the forced expression of modern methods and materials (some as yet by no means perfected) bids fair to be of considerable historic importance. Needless to say, the protests against the "International" attitude by those who believe architecture is still a matter of individual creation, still a fine art, were numerous and, in some cases, eloquent.

The end of the year saw the opening of the first two units of Rockefeller City (by Reinhard and Hofmeister, Corbett, Harrison, and MacMurray, and Hood and Foulhoux), the Radio City Music Hall, and the "Roxy" Theatre, the first seating over 6000, the second slightly over half as many. Architecturally, their interiors proved more exciting and more satisfactory than the exteriors. The Music Hall is a great trumpet shaped auditorium, with walls and ceilings blended into one curve. Breaks in this surface allow concealed lighting and ventilation, and the entire effect is most impressive. The Theatre is totally different, with vertical walls of wood veneered on metal, a horizontal ceiling, and a great chandelier; the effect, despite its size, is definitely intimate. Both are furnished with ample and luxurious lounges, etc., in which many of the best of the modern New York designers had a hand. The Music Hall and its appurtenances were under the general control of Donald Deskey; the Theatre under that of Eugene Schoen. It is not necessary to enter here into more discussion of the wider social, economic, and artistic implications of the whole group. These were touched upon in the article on Architecture in last year's **INTERNATIONAL YEAR BOOK**, and the whole mat-

ter analyzed forcefully in one of Walter Lippmann's articles for the New York *Herald-Tribune*.

Work on the Chicago World's Fair progresses. During the year the Hall of Science, by Paul Cret, the Electricity Building, by Hood and Foulhoux, the Transportation Building by Corbett, Harrison, and MacMurray, and the Administration Building by Holabird and Root were all substantially completed. Extended comment must await the opening of the Exposition; in the meantime, however, it is possible to note the curious fact that allies this Chicago group to Rockefeller City—the total absence of any monumental group plan. Thus the buildings are not arranged so that each helps the other, and the total effect is more impressive than that of the mere sum of the aggregates, but they are treated as mere individual entities, almost unrelated.

The work on the complex of Governmental buildings to fill the "Triangle" between Pennsylvania Avenue and the Mall in Washington, D. C. still continues. Here again the general plan is crowded and confused, apparently working for individual small centres of interest rather than any large and clearly apprehended effect. The existence of this quality in the three largest projects in recent American architecture (the Washington Triangle, Rockefeller City, and the Chicago World's Fair) cannot but arouse the disturbing question: have we American architects forgotten how to plan? Have we been so obsessed with the mere practical question of furnishing square feet (usually too many) of building on square feet of land (usually too few) that the tremendous opportunities of group arrangement to give group effect have simply faded from consciousness?

One group of buildings completed during the year forms a welcome exception—the War Memorial Buildings in San Francisco—a Veteran's Memorial Building, and the San Francisco Civic Opera House, both by Arthur Brown, Jr., with G. Albert Lansburgh collaborating on the Opera House. Despite the purely academic style of these buildings, in a conventional Doric order, they form one monumental whole with the City Hall, and create a mass effect of dignity and space unusual in this country. The plans of the individual buildings are clear, simple, and direct, that even the over-heavy interior detail cannot hide a certain nobility of conception.

The Louisiana State Capitol, at Baton Rouge, La., by Weiss, Dreyfous, and Seiferth is another example of a plan more beautiful than the details of its execution. The style is that type of modernized classic that seems more and more to be the accepted official style of the country. The building in general mass, as in style, is obviously influenced by Goodhue's epoch-making Nebraska Capitol; like the older building the Louisiana Capitol has a high office Tower instead of a dome, and depends much on incidental monumental sculpture. Lorado Taft, Lee Lawrie, Ellerhausen, and others furnished this: in the main the result is dignified, clear, and effective. The interiors are also effective and imaginative, but one questions as inharmonious the use of archaeological forms in the Senate Chamber.

Among other public buildings, the auditorium of the State Education Building in Harrisburg, Pa., by Gehron and Ross deserves mention for its simple dignity and its stunning decorations by Eric Gugler; and the City Hall at Kalamazoo,

Mich., by Weary and Alford, for its dignity and direct use of the modernized classic. The Water Tower in Washburn Park, Minneapolis, Minn., by H. W. Jones, has colossal figures decorating its buttresses, and shows exceptional thought applied to a practical necessity. The Veteran's Memorial Bridge at Rochester, N. Y. by Gehron and Ross is a superb arched bridge with great power in its simplicity, and the American Legion Memorial Chapel at Lakehurst, N. J. by Paul Cret, is a simple French Gothic building with a walled fore-court.

The Olympic Stadium at Los Angeles, Calif., by John and Donald Parkinson was more than adequate for the games for which it was built, and its monumental handling of its concrete walls and great arched entrance is characteristic of the underlying classicism of much of the best American work, even when without any trace of archaeological detail, and in a modern material. The Joslyn Memorial (an auditorium and museum) in Omaha, Neb. by J. and A. McDonald shows the same desire for classic dignity; its scale is beautifully handled, and its flanking masses well enframe the central colonnade.

Paul Cret's Folger Shakespeare Library, in Washington, is a monumental and attractive addition to the Washington buildings, with a quiet and dignified exterior, necessarily kept harmonious with the ruling classic of the city. The interiors are generally in the Elizabethan style, and there is a small theatre built as closely as possible in the style of the theatres of Shakespeare's own time. This extreme contrast in style and effect between outside and inside is regrettable if the building is considered as pure architecture, but it is a necessary result of the requirements and the site.

Three theatres of semi-civic type deserve mention. The Pilgrimage Play Theatre at Hollywood, Calif., by W. L. Woollett is an outdoor theatre with an enclosure of concrete using imaginative and fantastic forms, and the Guild Hall at East Hampton, Long Island, and the Kalamazoo Civic Auditorium, Kalamazoo, Mich., both by Aymar Embury II, are good examples of the small theatre with adjacent museum and reception rooms, etc. The East Hampton example has a charming colonial exterior surrounding a theatre unduly fantastic and frivolous; the Kalamazoo building is in a quiet modern style.

In educational work, the year was marked by the continuation of building at Princeton, by C. Z. Klauder, in the typical collegiate gothic style for which he is famous; by the completion in Rollins College, Winter Park, Fla., of the Annie Russell Theatre (by Kiehel and Elliott) and the Knowles Memorial Chapel (by Cram and Ferguson) in the usual undistinguished Florida Spanish; by the opening of the Cornell Law School, Ithaca, N. Y., the gift of Myron C. Taylor, built from the designs of Jackson, Robertson, and Adams in a simple collegiate Gothic; and in Chicago, by the International House (for foreign students) by Holabird and Root, in which the Gothic and modern styles seem contending for mastery, and the magnificent University of Chicago Field House, also by Holabird and Root, enclosing a vast arena 368 feet by 165 feet. Noteworthy also are the Harvard Biological Laboratories, Cambridge, Mass., by Coolidge, Shepley, Bulfinch, and Abbott, whose starkly simple brick exterior is relieved by a great frieze of animals cut into the brick from the design of Katharine

W. Lane; and the Slovak Girls' Academy, Danville, Pa., by H. Sternfeld, interesting for its imaginative and generally successful attempt to find a logical modern treatment for rough stone walls, and for its slim and interesting tower. The Santa Barbara School for Boys, Carpinteria, Calif., by R. D. Johnson, is a delightfully simple airy group with a modernized Spanish flavor.

**ECCLESIASTIC WORK.** The completion of the Washington, D. C. Episcopal Cathedral nave, by Frohman, Robb, and Littell, showed a charming and successful piece of archæology, of the high quality the previous work in Washington led one to expect; but as a serious contribution to the stream of American church architecture it leaves much to be desired; creation along those lines must be sought elsewhere. The Washington example is too bookish, too much the museum piece.

The Church of the Precious Blood, Astoria, N. Y., by H. L. McGill is interesting in its frank use of concrete trusses, and of rich marbles and metals inside, as well as a general freshness of composition; in quieter and less forced ways, G. B. Kaufman's Westwood Community Church, Los Angeles, is equally fresh. The Memorial Terrace Mausoleum, Glendale, Calif., by F. A. Hanson, with D. C. Allison as consultant mixes many styles without conviction, and the Mission Dolores Church of H. A. Minton is adequate California Spanish archæology.

The continuing colonial tradition in American churches is best represented by the Glenn Memorial Church, Atlanta, Ga., by Hentz, Adler, and Shutz, whose interior is more consistent than its exterior; and by the new building of the All Souls Unitarian Church in New York City, by Hobart Upjohn, daring in the powerful scale of its lofty spire and of its simple and monumental interior. It is altogether a most satisfactory solution of a discouragingly difficult problem—the design of a church for a congested city site in such a way as to dominate the much larger neighboring apartment houses.

**HOSPITALS, CLUBS, ETC.** The outstanding event of the year in this class of buildings was the opening of the vast plant on the East River in New York City of the combined New York Hospital and Cornell Medical Centre, by Coolidge, Shepley, Bulfinch, and Abbott. This enormous group of gleaming white buildings is remarkably impressive especially from a distance. Many details can be adversely criticized—an erratic use of pointed arches, for instance, and of other archæological elements in such a modern whole—yet if architecture really is the organization of space, surely this is a great architectural work. Its great masses are superbly organized and the main composition has a remarkable æsthetic directness, clarity, and simplicity.

Other hospitals deserving notice are the Springfield Hospital, Springfield, Mass. by Stevens and Lee and C. F. Neergaard, and the Kings County Hospital, Brooklyn, N. Y., by Leroy P. Ward.

The Woman's City Club, of St. Paul, Minn., by Magnus Jemme, has a most interesting plan of related polygons, and is a delightfully straightforward expression of modern materials, such as steel window sash. The Midland Country Club, Midland, Mich., by Frantz and Spence, is also modern, well planned, and with attractive interiors, but its modernity of feeling seems some-

how not quite at home in its rural surroundings.

**COMMERCIAL AND INDUSTRIAL BUILDINGS.** As might be expected, few important office buildings were built during this year. The cities seem to be largely overbuilt in office space, due to the frenzied construction during the boom years of extravagant and over-easy credit. Of office buildings completed during the year by far the most important architecturally was the Philadelphia Savings Fund Society Building, by Howe and Lescaze. Here for the first time the cantilevering and the horizontal emphasis and the elimination of all ornament of the "International Style," were applied to a skyscraper. The result is an exterior that somehow looks experimental; the relationships of vertical and horizontal, of tower and banking room below seem unintegrated, forced. Yet there is a simple directness about it all that is obvious, and the interiors are beautiful in proportion and noble in material. The whole building is bound to produce controversy, but it is bound to produce stimulation as well. The type is not a cheap type to build; its apparent economy is apparent only; and the question is necessarily aroused as to where simplicity and functionalism become artificial and forced.

Among the more conventional office buildings, the Lincoln-Liberty Building, Philadelphia, by J. T. Windrim, and 75 Federal Street, Boston, Mass., by Thomas M. James, are much alike in their simple verticals and somewhat incoherent setbacks. The Architects Building, Philadelphia, by members of the Philadelphia Chapter of the A.I.A. under the executive direction of V. D. Abel, is noteworthy on account of its direct unassuming simplicity, and the Valley Bank and Trust Co. Building, Phoenix, Ariz., by Morgan, Wells, and Clements, and H. H. Green, because of its rich delicacy. The Richman Building, Detroit, Mich., by Albert Kahn, frames its windows in one great rectangle frame. The South Western Bell Telephone Building at San Antonio, Tex., by I. R. Timlin, shows the almost necessary conflicts aroused by using the Spanish Baroque details on a vertically treated building. The best bank buildings of the year are the Los Angeles Branch of the San Francisco Federal Reserve Bank, by John and Donald Parkinson, nobly simple, and the delightful State Mutual Building and Loan Association, at Los Angeles, by W. Richards, with a sculptured base.

The Paramount Theatre, at Oakland, Calif., by Miller and Pflueger, with rich surface relief on the interior plaster walls, is gay and more skillful in composition than most such interiors; and the Cinema Art Theatre, Chicago, Ill., by Armstrong, Furst, and Tilden is noteworthy for its charming and direct simplicity, both outside and in. One interesting innovation in moving picture theatres was tried experimentally during the year—the sloping of the auditorium floor up toward the stage instead of the reverse. In this manner gallery slopes can be much reduced, and with the correct placing and angle of the screen the result is said to be increased comfort for all the audience.

**DOMESTIC.** Houses, in the main, continue conservative in style, so that it is the more modern types which seem romantic rather than the quieter traditional examples. Yet popular taste seems more erratic than for years. One type of taste swings madly into an extravagant "stage scenery" type of romanticism, full of artificial ir-

regularities, and false textures all represented at their worst by the "Wonder House" constructed as an ideal dwelling in the Wanamaker store in New York City; the same romanticism, the same love of the artificially antique can be seen used more skillfully—with disarming charm—in such houses as that of Gilbert Browning, Greenwich, Conn., by F. J. Forster and R. A. Gallimore. By contrast with this "escape" romanticism, most of the houses of colonial or Georgian inspiration seem straight-forward and modern; such are the Goodrum House, Atlanta, Ga., by Hentz, Adler, and Shutze, and the beautifully simple small houses on Colony Hill, in Washington, D. C., by H. W. Peaslee. The group for E. A. Bailey on Lookout Mountain, near Los Angeles, Calif., by Roy Selden Price, is a sort of fantasy on a colonial theme. Perhaps the best and most quietly effective houses, perfectly modern in their frank use of materials and their frank expression of plan, and yet based on a local tradition, are such variations of the wooden California ranch house as that of Clarence P. Day, San Marino, Calif., by H. R. Kelley, or that of J. D. Kern, Brentwood Heights, Calif., by John Byers. Equally fresh, simple, and expressive is the Rosengarten Estate, Chestnut Hill, Pa., by Willing, Sims, and Talbott. The most interesting of the purely modernist houses is that of F. V. Field, New Hartford, Conn., by Howe and Lescaze.

**HOUSING, ETC.** Housing activity was largely confined to studies, to proposals of projects, and to experimental buildings. Among the studies those of Henry Wright, on relative costs of serviced and non-serviced apartments, and on optimum types for different land values were especially interesting. The Lower East Side Planning Association of New York City, conducted a study of possible tenement developments in that area by Harland Bartholomew and Associates, City Plan and Landscape Engineers, and John Taylor Boyd, consulting architect. This study proved conclusively the wastefulness of the present block sizes, and the advantages of a larger unit, the "super-block." Among the projects the chief was Clarence Stein's group of many apartment houses, the Hillside Housing, for the Bronx, New York (already mentioned). Experiments along the line of the factory built house continued widely, both under corporation and individual auspices, but few important results were published. Buckminster Fuller continued his study of buildings hung from a central supporting mast—a method extraordinarily efficient in the use of materials, but giving rise to endless structural and maintenance problems as yet unsolved. Bowman Brothers of Chicago published various schemes based on isolated supports; a house of frameless steel sections, field welded, and one with an enamelled sheet steel exterior were built by other architects. This whole field of research is obviously still in its infancy.

**ENGLAND.** The amount and quality of building in the British Isles held up remarkably well despite the financial stringency, a fact that may reflect some essential differences between the credit systems of England and the United States. This is true of both public and private work. Public work includes the great Ulster Parliament Building, at Stormont, Belfast, by Arnold Thornby. It is a disappointing building in a sort of obviously official and heavy handed classic, well planned but far from exciting. Much more interesting is the Southampton Civic Centre by

E. B. Webber, simpler in detail, but with sufficient interest in massing to create a true monumental effect; its quiet and delicate Roman detail is merely incidental. The greater ostentation of the columns of the Sheffield City Hall, by E. V. Harris, makes a less effective exterior; but the interior is magnificent. The New Lambeth Bridge, London, by Sir George Humphreys, Sir Reginald Blomfield, and G. Topham Forrest, is a dignified addition to the London bridges: it has five gracefully arched spans. The Shakespeare Memorial Theatre, at Stratford on Avon, by Evelyn Scott, Chesterton, and Shepherd, has a beautiful plan, based on the precedent of the best modern German theatres, which should make it an excellent acting theatre. In style it is entirely without archaeological flavor; its quiet brick masses growing so naturally from the plan are admirable; they seem to "belong." The decoration consists of effective sculpture by Eric Kennington, and the richness of the incidental materials around doors, windows, and the like.

Of the commercial buildings, the most interesting is the Daily Express Building, Fleet Street, London, by Herbert O. Ellis and Clarke. It is entirely faced with black glass, with stainless steel strips covering the joints and working harmoniously with the window divisions. It is a daring, subtle, and successful design. In an entirely different vein, the monumental classic buildings that are arising along the embankment in London are making over the river aspect of the city. Whatever one's opinion of the use of Roman and Renaissance details to-day, it is undeniable that that group of great white façades over the water is most impressive. Among the London buildings of this type may be noted Unilever House, by Sir John Burnet, Tait, and Lorne; the National Provincial Bank, by Sir Edwin Cooper; Shell Mex House (more modern in detail, though similar in spirit) by the Messrs. Joseph; and Brettenham House, by Wm. and Edward Hunt. Broadcasting House (mentioned last year) by G. Val Myer, is impressive with its swelling curves, and its sculptured groups by Eric Gill, but it is chiefly remarkable for its varied and daring interiors by Raymond McGrath, Wells Coates, Edward Maufe, Dorothy Trotter, and S. Chermayeff. In Liverpool the classic Martin's Bank, by H. J. Rowe, deserves notice for its superb plan.

In industrial work, the New Boot's Factory, at Beeston, Nottingham, by Sir Owen Williams, is a straightforward expression of cantilevered construction with continuous windows, interestingly light and airy, and the Victoria Coach Station, London, by Wallis Gilbert and partners effectively combines horizontal strip-windowed wings with a vertical polygonal entrance tower. Moore's Garage, Kensington, by Robert Sharpe, combines an L-shaped building with a service station in the angle; the curved corners and continuous windows of the building give it a definite and unusual architectural value.

There was considerable activity in School and College construction during the year. Sir G. G. Scott added to Magdalen College, Oxford, a new quadrangle in quiet unassuming collegiate gothic; at Cambridge, Benson Court was built for Magdalene College by Sir Edwin Lutyens, in a more manneristic style, neither old nor modern. Other educational work deserving notice comprises a charming new Library for Wesleyan Theological College, Richmond, by E. Maufe; the Modern School for the Blind, Liverpool, by Mino-

prio and Spenceley; the double brick quadrangle for the Stamford Senior Boys School at Stamford by Percy Howard; the simple brick Residence Hall for Armstrong College, Newcastle on Tyne, by A. Dunbar Smith, and especially the extremely successful Manchester Grammar School, by Worthington and Jones, which so simply combines the charm of simple brick work with a slight and unforced Georgian flavor.

The recent advances in freedom in English Church design continued; especially interesting was St. Andrew's Church, Luton, by Sir G. G. Scott, with side aisles carried through the buttresses of the nave arches. St. Nicholas, Burnage, Manchester, by Welch, Cachemaille-Day and Lander, has an interesting simple exterior, but interiors over-heavy and forced; and St. Columba's Church, Liverpool, by B. A. Miller, is a daring and interesting experiment, not entirely successful, in varying the height of nave from low at the entrance to high at the sanctuary. E. Maufe's winning competition design for Guildford Cathedral is superficially Gothic in style; but this apparent trace of archæology is apparently only, and the whole conception is superbly original.

In house work, the most interesting is undoubtedly that done in a freely creative style. English architects of houses, as of commercial buildings, seem rapidly working out an independent way of designing that is as unrelated to the current cant of the "International Style" as it is to the past. In some cases it resembles slightly some of Mendelsohn's early work, but it nearly always retains something of the Georgian solidity. Marshall Sisson's brick house in Cambridge is characteristic, as is Broadlands, Ascot, by Minoprio and Spenceley, and the Hendon Sculptor's studio by John Pym. The bungalow at Bewdley, by Pritchard, Godwin, and Clist, is more like the International style work, while Frederick Etchell's lovely London house, with an interesting courtyard plan, has a façade delicately Georgian.

The most interesting housing work of the year was all in London, consisting of Levita House, St. Pancras, for the London County Council, by G. Topham Forrest, and the further housing estates in St. Pancras on Drummond Street and Brent House at Hackney, both by I. B. M. Hamilton. These are of the usual London type, with outdoor communicating balconies, and are beautifully planned around large gardens and smaller service courts. Aldford House, Park Lane, by Val Myer and Watson-Hart, is an interesting example of the recent luxury apartments being built in London.

The most important Canadian work includes the Confederation Building in Ottawa, by T. W. Fuller, in the somewhat unfortunate Romantic Château Type already set in the Canadian capital; the heavy official classic National Research Building in Ottawa by Sproatt and Rolph; the General Hospital, St. John, New Brunswick, by Pond and Pond, and Martin and Lloyd; St. Paul's Hospital, Vancouver, B. C. by Gardiner and Mercer, and the dignified Civic Auditorium at Winnipeg, Manitoba, by Northwood and Chivers, Pratt and Ross, and J. N. Semmens. The Extension of the Royal Ontario Museum in Toronto, by Chapman and Oxley, is a delightful piece of neo-Byzantine in rough stone and polychrome ornament. The General Electric Building, in Montreal, by Ross and MacDonald, is a simple piece

of modern commercial design with beautiful proportions; somewhat similar in spirit is the North American Life Building in Toronto, by Marani, Lawson, and Morris.

At Delhi, in India, a vast building around six courts was built from the designs of C. and F. Blomfield. Despite an open and effective plan, the building itself proved disappointing through the attempt to use the usual "British Empire" type of classic, with none of the original imagination shown in the earlier Delhi buildings.

FRANCE. In general, French official buildings continued disappointing in their use of an arid, rectangular, wire-drawn modern classic, with neither the dignity of Renaissance work nor the freshness of the modern. The new Service Technique des Constructions Navales, in Paris, is typical. The Ministry of Merchant Marine, Paris, by A. Ventre, is rather fine in a blocky manner; the courts, in a pure "International Style," are more interesting. The Municipal Salle des Fêtes, at Arles, by Castel and Dallest, has good interiors, rich and imaginative. The new station at Versailles-Chantiers, by A. Ventre, is also excellent, both in plan and in its simple arched entrances. The new Havre Station is less interesting.

The great block of industrial loft buildings on the Rue Balard, Paris, by J. Demaret, is interesting in its continuous sweeping horizontals like those so much used by Mendelsohn, in Germany; somewhat similar, though less consistent, is the Store called the "Trois Quartiers," by L. Faure-Dujarric. The Decré store, in Nantes, by the late H. Sauvage, is interesting in its all glass front. Several interesting moving picture theatres were completed during the year; especially the huge Gaumont Palace, by M. H. Belloc, and the lovely and unconventional Cinéma Victor Hugo, by Ch. Siclis, both in Paris. The Tribune of the Race Course at Compiègne, by P. Claparade, strikes a note of humorous anachronism in its false half-timbered front to a modern concrete grand stand. In the destroyed sections of France, much of the rebuilding is strangely hesitant in style, full of half-hearted attempts to follow local tradition without a deep understanding of it. Thus the Chamber of Commerce Building at Cambrai, by Herscher and Leprince-Ringuet, in brick and stone, succeeds only in aping an outworn art-nouveau; the Hôtel de Ville at Montdidier by Duval and Gonse, despite an excellent plan, has a similar character.

In apartment house and domestic work, the new buildings are almost entirely purely modern in planning and style. The Paris Apartment House by Ginsburg and Lubetkin is typical in its large windows across a narrow front. A new apartment, pent house and terrace by LeCorbusier and P. Jeanneret has great "chic"; it is thoroughly elegant in conception and detail. R. Mallet-Stevens' villa at Seceaux much resembles earlier work of his; the villa at Garches by A. and G. Perret is more classic in conception, with a beautiful plan, and attempts to give a frank expression of its concrete structure. In ecclesiastical work, the most noteworthy was a series of Churches and Augustine Monasteries by the well known Don Bellot, especially the church—quite modern in detail—at Audincourt (Doubs).

GERMANY. The depression resulted in an enormous diminution of work completed in Germany during the year. Little important governmental building was done except in schools; among

these must be mentioned the Hanover buildings by K. Elkhart, the Waldorfer School, Hamburg, by F. Schumacher, and schools at Gutach-in-Breisgau and Königstein, by M. Weber. All are, like the majority of contemporary German buildings, entirely free from traditional forms; those of Schumacher and Weber have the greatest human charm. Max Taut's great school in Berlin-Lichtenberg is, on the other hand, despite its interesting plan forms, harsh and arid.

The chief commercial building of the year was E. Fahrenkamp's enormous Shell Oil Building in Berlin, more interesting than successful, with horizontal strip windows and curved corners. Max Taut's recent Berlin office buildings are less manneristic, less forced, though equally modern. The Hamburg Shell Building, by R. Brünig, is an adequate addition to the city. H. and E. Gildermeister's Nordwollehaus, in Bremen is superbly simple, dignified, and gracious. The Roentgen Ray Factory at Hamburg-Fuhlsbüttel, by K. Schneider, the Mine Buildings at Herne, by Strunck and Wentzler, and the Klosters Electric Works by the Brunold Brothers, all exemplify the expected careful planning and creative thought which is characteristic of recent German industrial work.

In domestic work, modern trends reign supreme, but little is of the stark International Style type. His own Düsseldorf house by H. Jungmanns, for instance, is full of the influence of Frank Lloyd Wright's free creation. Elsaesser's great Frankfurt palace for a millionaire is full of imagination, as is the house on the Alster by Fahrenkamp. A house on the Taunus, by P. Behrens, is a superb creation, beautifully planned, with quiet, gracious, and luxurious interiors; it seems to belong to its site.

The amount of city housing fell off enormously during the year, reflecting the severe public credit stringency. Of the groups built, the apartments at Augsburg (the Lessinghof) by T. Wechs, at Munich by Otho Kurz, and at Berlin-Neuköln, by A. Klein, are the best. Noteworthy also is a little community of high-gabled small houses built for the Reichsheimstätten at Oberrnigk, Breslau, by M. Schemmel.

Other German buildings deserving notice are the eccentric but effective Heilig-Geist Church at Frankfurt, by M. Weber; the Sonnenblick Sanatorium at Marburg a.d. Lahn, by Hebebrand and Kleinertz; the Children's Clinic of the Essen City Hospital, by E. Bode; the Hamburg Golf Club at Altona-Rissen, by Elingius and Schramm; and the Café and Dance Hall at Bad-Tolz, by Moll and Von der Velden.

ITALY. Italian taste still wavers, with rather deplorable results, between a heavy Baroque Renaissance and more modern types. Turin, as might be expected, is the centre of the most baroque forms; the Building of the Campagna Anomina d'Assicurazione di Torino, by E. Decker, and the Orthopedic Pavilion of the Maria Vittoria Hospital, both at Turin, are typical. Roman work tends to be more restrained, more monumental; the influence of the high Renaissance is stronger. Thus the Ministry of Aeronautics, Rome, by R. Marino, achieves a kind of brutal dignity that is effective; the interiors are large and well done. The same architect's Elementary School in Rome is somewhat similar in character; the Pontifical School of the Brothers of Nostra Signora della Misericordia, in Rome, by A. Calza-Bini, and M. DeRenzi, is more quietly Renaissance. There were

also effective rather Renaissance apartment houses by R. Perullo and S. de Rose, and by V. Gavalleri, and more modern (and more interesting) apartment houses in Rome by P. Aschieri, and at Ostia by M. Marchi, with interesting balconies and setbacks.

The extremely fresh and imaginative modern design of the Giovanni Berta Stadium at Florence, by P. L. Nervi, makes beautiful use of its concrete, with daring and beautiful cantilevers. The Club House of the A.M.I.L.A. on the Lake of Como, by P. Lingeri-Tremezzina, is an effective work in the International style; equally modern is the beautiful Hotel Monte Verità, at Ascona, by the German E. Fahrenkamp.

OTHER COUNTRIES. In Holland, the most important work comprised Unilever House, Rotterdam, by H. F. Mertens, with typically interesting brickwork; the building for Het Volk, Amsterdam, by J. Buijs and J. Lürsen; the stunning Department Store De Bijenkorf, at The Hague, by W. M. Dudok; and good simple housing at The Hague, "Hogenhoucklaan," by F. Lourysen.

Switzerland saw much building, revealing influences from both the German and French modern schools, and also a charmingly direct and non-stylistic approach characteristic especially of Switzerland itself. The great Medical School at Berne University by Salvisberg and Brechbühl shows the more radical type; the same architects' Suva Insurance Building in Berne is less forced. Interesting schools were the Primary School in Berne—Bumplitz, by K. Indermühle, a high school at Zurich by A. Frölich, and the Friesenberg School at Zurich by Henauer and Wilschi. The Golf Club "Zumickon," at Zurich, by the same architects, is imaginative and charming, as are the two new business buildings on the Marktgasse at Berne, one by Trachsel and Abühl, and one by Gerster, which preserve the old arcades and eaves line of the street. The "International Style" is represented by the Temporary Building of the Disarmament Commission of the League of Nations, at Geneva, by A. Guyonnet, and the Clarté Apartments at Geneva by LeCorbusier and P. Jeanneret, which consist of four superposed duplex apartments, with an almost continuous glass frontage. Charming houses in a freer vein at Zurich, by W. Moser, and at Lucerne, by A. Meili, also deserve notice.

The most interesting Swedish buildings were the Concert Hall at Helsingborg by Sven Markelius, with an interesting arrangement of café and entrance hall; the Riksförsäkringsanstalt in Stockholm, a dignified executive office building around an oval court, by Hedberg and Nelson with a façade by A. F. Kyrkogata; and housing near Stockholm by Björn Hedvall, Sundahl, and Thundström, and the lovely group at Malarsee by Sven Wallender. In Denmark the Sea Baths at Bellevue, by Arne Jacobsen, and good houses in and near Copenhagen by A. Jacobsen, K. Holmgaard, and V. Luritzen deserve note; as do the houses in Oslo, Norway, by A. Pederson, and at Trondheim, Norway, by A. Bugge. The high quality of Finnish architecture continued. Especially interesting were U. Ullberg's Pantlaneinrättning and his Petri-Pauli Församlingshus, both in Viborg; and the large Helsingfors apartments, as well as the Trade School, by V. Vahakallio. Other important works were the Coöperative in Rauno, by Aulanko and Huttunen, the Lutheran Church, Helsingfors, by H. Ekelund; sanitaria by Jung and Jung and by E. Forsman,

and the University Dental Clinic, Helsingfors, by the late A. Lindgren.

In Hungary the outstanding work was the great memorial square in Szeged, by B. Rerrich, surrounded by a memorial arcade, the Bishops' Palace, and the University. Notable also was the village of experimental houses at Budapest, by Ligeti and Molnar.

The great event of the year in Russia—and one perhaps with a significance wider than now appreciated—was the *volteface* of the Russian Government with regard to architectural style. It involved an official abandonment of the "International Style," and the doctrine of the building as a machine, claiming that the essence of building was not a mechanical but a humanistic matter. It condemned all buildings designed along the lines of Le Corbusier, Gropius, etc., and also the American sky-scraper school, as purely bourgeois manifestations, expressing only the slavery of the individual to machines and profits; and it urged a more free, more decorative approach, using more sculpture and mural painting, and founded on a thorough appreciation of the architectures of the past. As a result, the design for the great people's palace, the competition of which was held last year and won by the American, Hamilton, is to be completely junked and the whole question reexamined.

South American Architecture remains as a whole undistinguished. A Municipal Library in Rio de Janeiro, by E. Bahiana, is well above the average; it is designed in a sort of American Modernism. The Centro de Almaceneros Minoristas, by Danero and Manfredi, has an attractive modern little theatre, and the School of the Republica Oriental de Uruguay, by the government school architect, is commendably simple. The most interesting South American work to-day is undoubtedly that which is most radical, and which approaches most closely the International Style. Examples are the excellent Hindu Club at Buenos Aires, by A. V. Vilar, with a clever plan, and an outdoor swimming pool; and a house in Belgrano, near Buenos Aires, by A. Prebisch.

**ARCTIC EXPLORATION.** See POLAR RESEARCH.

**ARDEALITE.** See MINERALOGY.

**ARENS, FRANZ XAVIER.** An American musician, died in Los Angeles, Calif., Jan. 28, 1932. He was born in Neef, Germany, Oct. 28, 1856, but was brought to the United States at the age of 10. Later he returned to Germany to attend the Royal Conservatory of Music in Dresden. He studied under Rheinberger, Wüllner, Abel, Janssen, and Kirchner. Following his graduation in 1885 he became conductor of the Philharmonic Orchestra of Cleveland, Ohio. From 1890 to 1892 he was again in Europe in charge of the "American Composers' " concerts. He conducted the Indianapolis Music Festival from 1892 to 1896 and took part in the musical activities at the World's Columbian Exposition of 1893. On removing to New York City in 1897 he became conductor of the New York Manuscript Society's concerts, and in 1900 he founded the People's Symphony Concerts for the purpose of bringing the best music to the masses. From the beginning these concerts, which Mr. Arens conducted at Cooper Union, were successful, and the movement spread to other cities. In 1910 he formed a chamber-music organization, called the People's Symphony Auxiliary Club, the concerts of both organizations being held at the Washington Irving

High School. He retired in 1926, living thereafter in California.

**ARGENTINA.** A federal republic occupying, with Chile, the southern third of South America; consisting of 14 Provinces, 10 Territories, and the Federal District. Capital, Buenos Aires.

**AREA AND POPULATION.** With an area of 1,153,119 square miles, Argentina had an estimated population on Apr. 8, 1932, of 11,050,000, compared with 7,885,237 at the census of 1914. With the exception of about 30,000 Indians, the inhabitants are of European antecedents. Over 30 per cent of the Argentinians live in 10 cities. Buenos Aires alone had an estimated population of 2,195,200 on Apr. 8, 1932. Other leading cities are Rosario (estimated, 1931), 480,936; Córdoba, 1930, 253,182; La Plata, 1928, 165,813; Avellaneda, 1930, 209,512; Tucumán, 91,216. For the five-year period 1925-29, births and deaths averaged 304,465 and 135,912, respectively, exclusive of the Territories. Immigration in 1931 declined sharply to 56,333 from 124,006 in 1930; emigrants numbered 53,677 (59,734 in 1930). Immigrants are mainly Spaniards, Italians, and Slavs. The new British settlement of Victoria, on the Paraná River, was founded in 1932.

**EDUCATION.** Although primary education is free, compulsory, and secular, 21.98 per cent of all voters were illiterate in 1930 (35 per cent in 1916). Primary schools in 1931 numbered 11,330, with 1,509,373 pupils; secondary, normal, and special schools, 456, with 62,674 pupils. There are national universities at Córdoba (2500 students), Buenos Aires (12,532), La Plata (3000), Tucumán (600), and Santa Fé (National University of the Litoral, with branches in Rosario, 4000).

**PRODUCTION.** Argentina ranks among the first five nations of the world in agriculture and stock raising, the products of which are for the most part exported. Due to the lack of adequate mineral, fuel, and water-power resources there is no basis for extensive industrial development. Manufacturing is confined principally to the preparation of foodstuffs. The area of land under crops and cultivated grasses totaled 62,479,000 acres, or 9 per cent of the total area, in 1928-29. Nearly 30 per cent of the entire country is suitable for cultivation but the system of land tenure, under which some 17,000,000 acres of farm land are held in estates of 25,000 acres or over, prevents the proper utilization of the soil. There are about 2,600,000 acres of orchards, vineyards, and yerba maté, 304,000,000 acres of pasture land, and 186,000,000 acres of forests. Production of the chief crops for the 1931-32 season, with 1930-31 figures in parentheses, follows in metric tons: Wheat, 6,149,000 (6,421,837); oats, 1,006,000 (765,108); corn, 9,464,320 (9,744,780); and linseed, 2,171,000 (1,784,807). Alfalfa, cotton, potatoes, sugar, vegetable oils, and tobacco are other leading products. Production of quebracho-extract for export (140,996 tons in 1930) is an important industry.

Livestock at the census of July 1, 1930, included: Cattle, 32,211,855; sheep, 44,413,221; horses, 9,858,111; swine, 3,768,738. Meat refrigeration is the leading industry. There were exported in 1931 553,519 metric tons of frozen and chilled meats, compared with 565,100 tons in 1929. Flour mills have an annual average output of about 7,000,000 sacks. The dairy and textile industries have expanded, the latter under high tariff protection. Petroleum production in

1931 increased to 11,608,000 barrels, from 8,908,792 barrels in 1930. State-owned old fields produced the bulk of the supply. Mining is of limited importance the principal metals worked being gold, silver, copper, and tin. Tungsten, coal, borate, salt, and limestone are also found.

COMMERCE. Argentina's unfavorable trade balance in 1930, amounting to \$111,326,200, was changed in 1931 to a favorable balance of \$120,351,774. The 1931 exports increased slightly to \$621,341,697 from \$595,681,055 in the previous year, while imports declined approximately one-third to \$500,989,923 from \$717,007,262 in 1930. According to the Argentine economist, Dr. Alejandro E. Bunge, exports in 1931 were 70 per cent greater in volume than in 1930, while the nation imported only 15 per cent of the total goods consumed, as against 40 per cent a few years earlier. Imports in 1931 came chiefly from the United Kingdom, \$102,836,816 (\$142,165,722 in 1930); United States, \$82,873,130 (\$158,224,646); Germany, \$59,169,496 (\$84,373,127); Italy, \$41,609,307 (\$66,980,611); France, \$30,717,727 (\$43,196,776). Exports went principally to the United Kingdom, \$239,117,771 (\$217,635,816); the Netherlands, \$65,140,686 (\$55,501,467); Belgium, \$57,097,574 (\$54,982,818); France, \$52,488,845 (\$39,894,862); Germany, \$51,008,313 (\$52,533,412). Of the total 1931 exports, \$218,705,673 represented live animals and meat products and \$376,379,337 farming products. The leading imports, in order of value, were fuel and lubricants, textiles and their manufactures, alimentary substances, iron and steel and their manufactures, and machinery and vehicles. The above figures were converted to dollars from gold pesos at the gold peso's par value of \$0.97.

Preliminary figures for 1932 placed exports at 566,366,000 gold pesos (640,588,000 gold pesos in 1931) and imports at 367,956,000 gold pesos (516,484,457 in 1931). As compared with 1931, exports declined 11.6 per cent and imports 28.8 per cent. The favorable balance of trade in 1932 was 198,410,000 gold pesos (124,073,994 gold pesos in 1931).

FINANCE. The budget for the calendar year 1932, as approved by the Chamber of Deputies in March, 1932, was estimated to balance at 839,263,376 paper pesos (about \$209,815,844 at 1932 exchange rate). Due to an unexpected decrease in national revenues, the Minister of Finance on Nov. 10, 1932, estimated a deficit for the year of 50,000,000 pesos (about \$12,850,000). The Treasury's statement of actual payments and receipts during the calendar year 1931 showed total receipts of 820,244,000 paper pesos (1,266,980,000 in 1930) and total expenditures of 833,366,000 paper pesos (1,250,294,000 in 1930). Including other charges applicable to the 1931 account, the deficit for the year was estimated at 109,000,000 paper pesos, as against a deficit approximating 378,000,000 paper pesos in 1930.

The annual report of the Corporation of Argentine Bondholders, issued in July, 1932, placed the foreign debt at 993,719,000 paper pesos (about \$248,430,000), the internal funded debt at 1,403,853,000 pesos (about \$350,943,000), and the floating debt at 1,474,000,000 pesos (about \$370,000,000). This made a total national debt of 3,871,572,000 paper pesos (about \$967,893,000). In the same report, the total public debt of the 14 Provinces was placed at 1,174,710,764 paper pesos (about \$293,677,691) and that of the 21 municipalities at 371,113,570 paper

pesos (about \$92,778,392). The total internal and external debt of the nation, Provinces, and municipalities in 1932 amounted to a per capita debt of \$167, compared with \$289 for the United States and \$930 for the United Kingdom.

Argentine currency consists of gold and paper pesos, with a par value for the former of \$0.9648 and for the latter of \$0.4245. The average exchange value of the gold peso in 1931 was \$0.6674; of the paper peso \$0.2936.

COMMUNICATIONS. Railways in operation at the beginning of 1931 totaled 25,435 miles, of which 5922 miles were state owned. On Aug. 20, 1932, a 283-mile stretch of line across Northern Argentina, connecting Tucumán with Córdoba and Mendoza, was opened to traffic. The line opened to active settlement a fertile frontier region adapted to the production of grain, linseed, and cattle. Highways in 1931 extended about 128,690 miles, of which 2000 miles were good motor roads. Air lines connected Buenos Aires with numerous cities in the Republic and others throughout South and North America. Vessels entering Argentine ports in the foreign trade in 1930 numbered 2557, of 9,886,812 tons.

GOVERNMENT. The Constitution, which was suspended from Sept. 8, 1930, to Feb. 16, 1932, vests executive power in a president elected for six years, and legislative power in a national congress, comprising a senate of 30 members elected for nine years, and a chamber of deputies of 158 members elected for four years. The Governors of the Provinces exercise extensive powers independently of the central executive. President in 1932, Gen. Don Augustin P. Justo, who was elected Nov. 8, 1931, and succeeded Provisional President José Francisco Uriburu on Feb. 20, 1932. Vice President and President of the Senate, Señor Guilio Roca.

## HISTORY

POLITICAL DEVELOPMENTS. The internal political situation was sufficiently stabilized by General Justo's overwhelming victory in the elections of Nov. 8, 1931, to permit the reestablishment of constitutional government early in 1932. Final results of the voting, announced by the National Electoral College on Jan. 30, 1932, gave General Justo 234 electoral votes to 124 for his opponent, Dr. Lisandro de la Torre. Provisional President Uriburu immediately convoked the provincial electoral colleges for February 5 to replace with elected Governors the Federal interventors who since the 1930 revolution had governed 12 of the 14 Provinces. On February 20, General Justo was formally installed in the Presidency. True to his pledge, Provisional President Uriburu stepped aside when the work of his *de facto* régime was ended. Widely acclaimed by his countrymen, he retired to Paris, where he died on April 29 (see URIBURU, JOSÉ FRANCISCO).

Constitutionalism became effective with General Justo's inauguration, General Uriburu having paved the way with decrees pardoning former President Hipólito Irigoyen and authorizing the return of many exiled political enemies. The new President immediately restored the Constitutional guarantees suspended by the Provisional government, ended the régime of martial law, and convened the newly elected National Congress in special session on March 28 to deal

with the critical financial condition of the government.

Although Argentina alone among the South American republics continued to meet the service of interest and amortization on its foreign debt, the financial and business situation was menacing. The government had a floating debt so large it could no longer be covered from general revenues. There was a large budget deficit. Salaries of public employees were badly in arrears. And the peso was depreciating alarmingly in the exchange market. The difficulties confronting business was indicated by bankruptcies involving the record sum of 369,618,792 paper pesos during 1931, a sum 60 per cent greater than in 1930.

The Government's programme for meeting its financial needs included taxes on incomes, inheritances, and sales, drastic economies in the public services, and the release of 3000 conscripts in June, despite the completion of only half of their term of military service. Extensions until 1933 were secured on \$20,000,000 of 6 per cent notes due to American bankers on April 1 and July 1, 1932. On April 27 all purchases of foreign exchange were made subject to governmental permit. On May 25 a patriotic loan of 500,000,000 pesos paper was launched to pay back salaries of public employees and other domestic bills.

Supported by the National Democrats and Radical Antipersonalistas, General Justo had a majority in both houses of Congress in support of his programme. The National Democrats held 64 and the Radical Antipersonalistas 26 of the 158 seats in the Chamber, the remainder being divided among the Independent Socialists (44), Progressive Democrats (13), and Socialist Alliance (11). In the Senate there were 15 National Democrats and 11 Radical Antipersonalistas against 2 Independent Socialists, and 2 Progressive Democrats. Accordingly, the bulk of the government's tax and economy proposals were passed by Congress. Additional taxation was envisaged in a national highway law signed by the President on October 5. It was similar in many respects to the Federal aid highway laws of the United States.

While approved by the Left groups, who dominated the Chamber, these measures aroused the hostility of the taxpayers, the conservative elements, and many army officers, who had supported General Justo in the Presidential election. Talk of another coup against the government among these elements brought the radical and labor elements to the President's defense. On June 13, a mass meeting of all the Leftist parties, excluding the Irigoyen and Alvear Radicals, pledged themselves to oppose any effort to overthrow President Justo by force. A number of taxpayers' strikes were organized by agriculturalists, breeders, and industrialists. The Government, however, tempered the radicalism of the extreme Left groups. It successfully opposed a measure for inflating the currency. In the second half of the year favorable crop prospects and sustained cereal prices served further to allay conservative discontent.

The Irigoyen, or Personalista, Radicals, who had been ousted from power by the popular revolution of Sept. 6, 1930, remained unreconciled to the Justo government. On December 16, police agents in Buenos Aires nipped in the bud an elaborate conspiracy for the overthrow of the government. The former Radical Presidents

Hipólito Irigoyen and Marcelo T. de Alvear were arrested along with a score of Radical leaders. A state of siege, suspending all constitutional guarantees except the right of trial before civil courts, was authorized by Congress on December 17 for 30 days, despite the opposition of Socialist deputies, who were prevented by troops from leaving the Chamber and breaking a quorum. Applied at first to Buenos Aires, the state of siege was extended to all the Provinces on December 19 on the ground that the Radical organizations in a number of Provinces were involved in the plot.

According to documents made public by the government following its raids on Radical centres throughout the city, the plotters planned to turn the city over to criminals and terrorists for 48 hours in revenge for its repudiation of the Radical régime in 1930. Unable to gain the support of the army, the conspirators determined to seize power by means of bands of civilians armed with hand grenades. An official cabinet statement alleged that the revolutionists planned "to kidnap and kill high public officials, take possession of public buildings housing vital services, (and) destroy others with hand grenades. . . ." Over 4000 bombs and hand grenades were seized by the police. The connection of the Anti-personalista, or Alvear wing of the Radical party with the conspiracy was not clear, the government disclaiming responsibility for the arrests of Señor de Alvear, Honorio Pueyrredón, former Ambassador to the United States, and other Anti-personalista leaders. At the end of the year they were still in custody of the judges investigating the plot.

Meanwhile, an extra session of Congress had been in session from November 21 to consider new legislation proposed by the government, including the establishment of a government monopoly of the oil industry and government control of the meat-packing business and the production, sale and exportation of grain. Congress was asked also to approve a 1933 budget carrying expenditures of 865,113,500 paper pesos and revenue estimates of 870,254,000 pesos, or about \$216,278,375 and \$217,563,500, respectively. Finance Minister Hueco's budget called for new taxes to bring in an additional 41,000,000 pesos (about \$10,500,000) of revenue. On December 21 Congress rejected the tax-increase proposals, in response to nation-wide protests and threats of further tax-payers' strikes. Previously (December 13) Congress had rejected a Socialist bill to suspend sinking-fund payments on Argentina's foreign and internal debt. Bills passed by Congress authorized the construction of a new trans-Andean railway connecting Salta, in northern Argentina, with Antofagasta, Chile, and re-established commercial relations with Chile. The railway between Mendoza, Argentina, and Los Andes, Chile, which had been closed for eight months in connection with a tariff dispute, was reopened on December 5.

While the Socialists were not directly implicated in the Radical conspiracy, the coercion exercised by the government on December 17 in securing authorization for a state of siege caused the Socialist Deputies to absent themselves from the Chamber, which was thereafter unable to function for lack of a quorum. The increasingly difficult financial system led the Bank of the Nation to secure the services of Sir Otto Niemeyer, vice governor of the Bank of England, as adviser on the banking and exchange situation. Early in

December, it was reported that the Provinces of Buenos Aires and Córdoba and the city of Tucumán were attempting to negotiate moratoriums or agreements for reduced interest and amortization payments with foreign bankers. Buenos Aires Province officials announced December 24 that British and French bankers had agreed to an arrangement whereby the Province would save 27,000,000 pesos (about \$8,939,000) annually for three years on debt service. New York bankers had not accepted the plan.

A notable development of the year in the domestic field was the passage by Congress of a law extending to women the same political rights and duties as men, including the suffrage but excluding the obligation to bear arms. On October 21, an Argentine court ordered the release of 134 members of the notorious Zwi Migdal Society imprisoned since 1929 as a result of a campaign against white slavers. The court ruled that the society could not be considered an illicit association under Argentine law.

**FOREIGN RELATIONS.** The outbreak of the Bolivian-Paraguayan conflict in the Chaco Boreal, threatening to upset the status quo in South America, confronted Foreign Minister Saavedra Lamas with a delicate and potentially dangerous situation (see BOLIVIA under *History*). In general, the sympathies of the nation were on the side of Paraguay. Argentina's economic ties with Paraguay were closer than those with Bolivia and an Argentine mission had been training the Paraguayan army. The Foreign Office played a leading part in the efforts of the neutral powers to restore peace. Nevertheless in a secret note to the Commission of Neutrals at Washington, the Foreign Minister vigorously opposed proposals for the establishment of a neutral blockade or boycott to enforce peace. He declared that the League of Nations was the sole organization legally authorized to undertake such measures. His stand blocked effective action in the dispute by the 18 other Pan-American governments.

This stand was significant, in view of the action of the Chamber of Deputies on September 28 in approving a bill authorizing Argentina's full membership in the League of Nations. The bill carried a reservation against the recognition of the Monroe Doctrine as a regional agreement, such recognition being accorded the Monroe Doctrine in Article XXI of the League covenant. The action of the Chamber cleared up Argentina's ambiguous position with relation to the League. It was regarded as a member by the League Secretariat, although dues had not been paid since 1928. But due to President Irigoyen's action in joining the League without consulting Congress, his action was held unconstitutional from an internal viewpoint.

On November 17, Foreign Minister Saavedra Lamas published the text of a proposed South American anti-war pact, which Argentina had submitted to other South American countries in June and which he said had been accepted by several.

A serious threat to Argentina's important cattle-raising and meat-packing industry developed in July, when representatives of South Africa and Australasia at the Ottawa Conference of the British Commonwealth of Nations demanded that Great Britain grant them tariff and other concessions which would permit an increase in their meat shipments to the British

market. Alarmed by this possibility, Minister Saavedra Lamas proposed the negotiation of reciprocal tariff conventions to the United States and other countries active in Argentina's foreign trade. The American Ambassador replied that the American tariff law did not permit the President to enter reciprocal agreements of this kind.

In the agreement finally reached at Ottawa, the British government declined to do more for the Dominions than to restrict British purchases of Argentine meats to the 1931 level. However, the unfriendly attitude evidenced toward foreign investments in Argentina (in which British capital predominated) toward the end of 1932 produced a change in British policy. Argentina was informed that this feature of the Ottawa agreement would be continued for only 18 months and that unless reciprocal advantages were forthcoming from Argentina her meat exports to Great Britain would thereafter be curtailed in favor of the Dominions. It was announced October 28 that President Justo would send a special embassy to London, headed by Vice President Julio Roca, to negotiate a commercial agreement.

Periods of strained relations with Uruguay and Peru also marked the year. Uruguay severed diplomatic relations July 13, following charges that Argentine officials had kept under surveillance a Uruguayan cruiser and its officers sent to Buenos Aires July 9 to participate in the Argentine Independence Day celebration. It had been rumored that Gen. Severo Toranzo, commander of the Argentine Army under ex-President Irigoyen and an exile in Uruguay, was on board the cruiser. The severance of relations produced extraordinary demonstrations of mutual regard between the two peoples. Uruguay sent a confidential agent to Buenos Aires to discuss the resumption of normal relations and this was accomplished by a protocol signed September 12. See URUGUAY. Strained relations with Peru resulted from widespread protests in Argentina against the action of the Peruvian government in holding the Peruvian Aprista leader, Haya de la Torre, on charges of conspiracy and sedition. Petitions for his release, formulated by the Argentine Chamber of Deputies and various organizations, led the Peruvian Ambassador in Buenos Aires to protest against these interferences in Peru's internal affairs. See PERU under *History*.

The cordial relations with the United States reestablished by the Provisional government of General Uriburu were maintained throughout 1932. In July, the Foreign Minister rejected a Peruvian proposal for concerted Latin-American reprisals against the tariff policy of the United States (see PERU). A similar response was given to proposals for a Latin-American customs union, designed chiefly to counteract the economic preponderance of the United States.

**ABRIEL DAM.** See DAMS.

**ARIZONA, POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 435,573, as against 334,162 in 1920. Phoenix, the capital, had (1930) 48,118 inhabitants.

**AGRICULTURE.** The table on page 59 gives the acreage, production, and value of the principal crops for 1932 and 1931.

**MINERAL PRODUCTION.** The profound depression of the copper-mining industry was particularly felt in Arizona, not only by reason that this State was the Union's leading copper producer and preëminently devoted to this

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1932	113,000	82,000 <sup>a</sup>	\$3,157,000
	1931	176,000	115,000 <sup>a</sup>	4,238,000
Hay	1932	147,000	373,000 <sup>b</sup>	2,380,000
	1931	139,000	379,000 <sup>b</sup>	3,407,000
Wheat	1932	29,000	609,000	329,000
	1931	24,000	672,000	497,000
Corn	1932	41,000	615,000	400,000
	1931	36,000	576,000	488,000

<sup>a</sup> Bales. <sup>b</sup> Tons.

branch of the mineral industry, but also because the decline in the State's copper output was more severe than for the country as a whole. Arizona's production attained only 400,344,909 pounds of copper for 1931, slightly more than two-thirds of the 570,897,080 for 1930 and less than half of the 820,206,475 for 1929. It fell further, to 183,887,000 lbs. for 1932. As decline in price went hand in hand with decline in quantity, the fall in the totals by value was even more marked; the copper product, by value, declined from \$36,522,387 (1931) to \$11,217,107 (1932). The production of gold, which in some other regions afforded a slight compensation for the reduced activity in other metal-mining, continued to fall in 1931, attaining for that year 136,805 fine ounces, as against 148,681 for 1930; in value, \$2,828,000 for 1931 as against \$3,073,000 for 1930. For 1932 it fell further to 66,980 ounces; by value, \$1,384,000. Production of silver diminished to 4,070,860 fine ounces for 1931, from 4,910,394 for 1930; and in value, more substantially to \$1,180,549 for 1931, from \$1,890,502 for 1930. For 1932 it dropped in quantity to 1,974,946 ounces; in value, to \$556,935. Outside of \$516,886 produced of stone, chiefly of inexpensive grades, no other mineral product attained to so much as \$500,000 for 1930. The total value of the State's mineral product was, duplications eliminated, \$82,933,802 for 1930; for 1929, \$157,959,792.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$7,960,042 (of which \$2,256,452 was for local education); for interest on debt, \$89,280; for permanent improvements, \$6,386,756; total, \$14,442,078 (of which \$7,081,019 was for highways, \$1,406,166 being for maintenance and \$5,674,853 for construction). Revenues were \$13,546,724. Of these, property and special taxes furnished 43.3 per cent; departmental earnings and compensation to the State for officers' services, 3.5; sale of licenses, 21.6 (in which was included a gasoline sale tax that produced \$1,878,150). Funded debt outstanding on June 30, 1931, totaled \$301,157. Net of sinking-fund assets, the debt was \$269,539. On an assessed valuation of \$718,579,181 the State levied in the year ad-valorem taxes of \$5,830,021.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 2472.46. Some 21 miles had been abandoned in the year previous.

**EDUCATION.** The work of the public schools during the year was handicapped, according to report in the *Journal* of the National Education Association, by almost universal reduction in teachers' salary schedules and suspension of automatic increases in their salaries; also by some curtailment in the teaching forces. School budgets in preparation at the end of the year were re-

ported as effecting curtailment of expenditure at the prevailing rate of about 15 per cent.

**CHARITIES AND CORRECTIONS.** Under the law as existing in 1932 a Board of Directors of State Institutions exercised control of the State institutions having the care or custody of persons. Each institution was administered by a superintendent under the authority of this board. The board consisted of three members: the Governor (who was president of the board), the State Treasurer, and a secretary (C. M. Zander), who was executive officer and purchasing agent. The institutions thus controlled were: State Prison, Florence; State Hospital for the Insane, Phoenix; Pioneers' Home, Prescott; State Industrial School, Fort Grant; State School for Girls (juvenile offenders), Randolph.

**LEGISLATION.** A special session of the State Legislature, which adjourned on January 11, provided for the needs of the State, excepting relief for the unemployed, as recommended by Governor Hunt. It placed a tax on chain stores but defeated bills to impose an income tax and a tax on luxuries.

**ELECTIONS.** The State cast a strongly Democratic vote on November 8, on both Presidential and State tickets. Dr. B. B. Moeur, Democrat, was elected Governor. Carl Hayden, Democrat, was reelected to the United States Senate. The voters ratified the repeal of the State prohibition law.

The popular vote for President was: Roosevelt (Dem.), 79,264; Hoover (Rep.), 36,104.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, George W. P. Hunt; Secretary of State, Scott White; Treasurer, Mitt Sims; Auditor, Ana Frohmler; Attorney-General, K. Berry Peterson; Superintendent of Public Instruction, C. O. Case.

**Supreme Court:** Chief Justice, Alfred C. Lockwood; Associate Judges, Henry D. Ross, A. G. McAlister.

**ARIZONA, UNIVERSITY OF.** A coeducational State institution of higher learning in Tucson, Ariz., founded in 1885. The 1932 autumn enrollment totaled 1926; the registration for the summer session of 1932 was 484. The faculty numbered 190. The income for the year 1931-32 was \$1,465,907. The university receives both Federal and State support. The library contained approximately 93,000 volumes. President, Homer LeRoy Shantz, Ph.D., Sc.D.

**ARKANSAS, POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 1,854,482, as against 1,752,204 in 1920. Little Rock, the capital, had (1930) 81,679 inhabitants.

**AGRICULTURE.** The following table shows the acreage, production, and value of the principal crops for 1932 and 1931:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1932	330,000	1,260,000 <sup>a</sup>	\$38,430,000
	1931	356,000	1,907,000 <sup>a</sup>	52,633,000
Corn	1932	1,993,000	35,874,000	10,045,000
	1931	1,954,000	43,965,000	16,267,000
Hay	1932	697,000	691,000 <sup>b</sup>	4,258,000
	1931	726,000	873,000 <sup>b</sup>	6,778,000
Rice	1932	150,000	6,900,000	2,553,000
	1931	177,000	9,558,000	4,206,000
Oats	1932	114,000	1,596,000	367,000
	1931	160,000	4,160,000	1,123,000
Potatoes	1932	37,000	2,627,000	1,681,000
	1931	43,000	3,655,000	1,901,000
Sweet potatoes	1932	38,000	2,660,000	1,277,000
	1931	32,000	2,624,000	1,601,000

<sup>a</sup> Bales. <sup>b</sup> Tons.

**MINERAL PRODUCTION.** There occurred another sharp diminution in the State's production of petroleum, its chief mineral product, to the quantity of 14,791,000 barrels for 1931, from 17,390,000 for 1930; and to the total value of \$7,200,000 (1931), from \$17,390,000 (1930). Gasoline produced from natural gas amounted to 26,282,000 gallons for 1931, as against 30,637,000 gallons, in value \$1,757,000, for 1930. Of natural gas itself, the figures on production for 1931 were not available, but there were produced in 1930, 18,585,000 M cubic feet, in value \$3,540,000. The quantity of coal mined totaled 1,238,000 short tons for 1931, as against 1,533,434 for 1930, for which year the total value of the coal output was \$5,153,000. Production of bauxite, of which the State continued to furnish the greater part of the domestic supply, fell to 186,697 long tons for 1931, from 315,273 for 1930; and to the value of \$1,081,450 for 1931, from \$1,823,389 for 1930. The clay products of 1930 (the latest tabulated year) were valued at \$1,074,103, as against \$2,024,403 for 1929. Sand and gravel and stone were each produced to a total of more than \$1,200,000 for 1930. The total value of the mineral product of the State, duplications eliminated, was \$34,901,476 for 1930; for 1929, \$41,324,576.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$16,203,756 (of which \$3,413,245 was for local education); for interest on debt, \$7,542,158; for permanent improvements, \$30,917,909; total, \$54,687,571 (of which \$27,431,289 was for highways, \$2,771,608 being for maintenance and \$24,659,621 for construction). Revenues were \$23,412,776. Of these, property and special taxes furnished 31.2 per cent; departmental earnings and compensation to the State for officers' services, 4.6; sale of licenses, 48.1 (in which was included a gasoline sale tax that produced \$6,529,156). Funded debt outstanding on June 30, 1931, totaled \$156,856,920, of which \$133,858,753 was for highways. Net of sinking-fund assets, the debt was \$156,849,350. On an assessed valuation of \$614,414,458 the State levied in the year ad-valorem taxes of \$4,861,774.

The State increased its debt to some degree in the course of 1932 by borrowing from the Reconstruction Finance Corporation of the Federal government. The Corporation reported at the end of the year that it had authorized loans to Arkansas, up to December 23, totaling \$1,319,168. This borrowing was for the purpose of obtaining funds with which to provide for the relief of destitute persons in the State. Arkansas obtained loans for this purpose month by month, beginning with September. They started at the approximate rate of \$250,000 a month and rose to the neighborhood of \$500,000 a month with the advent of winter. They sufficed for the absolute sustenance of an average of some 10,000 families.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 4812.54. In the year previous, 14 miles of line had been abandoned.

**EDUCATION.** A plan of work for the reorganization of the curriculum for the common schools, over a period of three years, was put under way. The certification of teachers was taken over by the State department of education. The number of persons of school age in the State, in the aca-

demic year 1931-1932, was reported as 640,028. There were enrolled in the public schools 446,151 pupils. Of these, 392,240 were in common schools or elementary grades; in high schools, 53,911. The expenditures of the year for public-school education totaled \$12,856,322. Salaries of teachers averaged, by the year, \$592.

**LEGISLATION.** A special session of the State Legislature was held in the spring, terminating on April 12. Some 69 of the 100 members of the State House of Representatives, insistent on passing measures of retrenchment that Governor Parnell opposed, attempted to convene the House in a rump session despite his order dissolving the session. The State Senate, however, obeyed the Governor's proclamation and dissolved. The State Supreme Court brought the session definitely to an end by declaring the rump House not to be lawfully in session.

A measure was passed to refund \$47,000,000 of road-improvement district bonds, partly assumed by the State in 1927, into a 4½ per cent issue, pledging the revenue of the State Highway Department, above a limit of \$1,000,000 a year for highway maintenance and another million for construction, to the redemption of the new bonds. The Legislature voted a resolution to memorialize Congress, requesting that it vote immediate full payment of the soldiers' bonus.

**POLITICAL AND OTHER EVENTS.** It was reported in March that 15,000 farming families had been enrolled in a voluntary united effort to embellish rural property in the State, which had been under way four years, under supervision of county agricultural agents and of the University of Arkansas. During the early part of the year a number of constitutional amendments, some of disputed practicability, were initiated by popular petition; one proposed tax-exemption for all homesteads owned by residents of the State who were heads of families; another proposed a sales tax; another, four year terms for State officers, a limited system of recall, split sessions of the Legislature, and prohibition of new State offices. Hattie W. Caraway, widow of the late Senator Caraway, was elected his successor (for unexpired term) in the United States Senate at a special election on January 12. She was renominated for the succeeding full term in the Democratic primary on August 9.

**ELECTIONS.** The State voted the Democratic Presidential ticket by a large majority on November 8. The popular vote for President was: Roosevelt (Dem.), 189,602; Hoover (Rep.), 28,467. J. M. Futrell, Democrat, was elected Governor, and the other Democratic candidates for State offices were elected, as well as seven Democratic incumbents in the Federal House of Representatives. The voters rejected a proposed constitutional amendment to create a State sales tax of 1 per cent on all merchandise except farmers' sales of their own products. They also rejected proposals to make homesteads tax-exempt; to set State aid to schools at \$6 minimum, per capita of the school population, and to prohibit further sale of road bonds unless approved by two-thirds of the voters.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, Harvey Parnell; Secretary of State, Ed. F. McDonald; Treasurer, Roy Leonard; Auditor, J. O. Humphries; Attorney-General, Hal L. Norwood; Superintendent of Public Instruction, C. M. Hirst.

**Supreme Court:** Chief Justice, Jesse C. Hart;

Associate Justices, Frank G. Smith, T. H. Humphreys, William F. Kirby, Thomas M. Mehaffey, E. L. McHaney, Turner Butler.

**ARKANSAS, UNIVERSITY OF.** A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871. It comprises the colleges of arts and sciences, education, engineering (including experiment station), graduate school and schools of law, business administration, and medicine, the last named being in Little Rock. In the autumn of 1932 the enrollment was approximately 2000, and for the summer session it was 639. The number of faculty members was 200. The endowment amounted to \$132,000, and the income for the fiscal year ending June 30, 1932 was \$870,000. The library contained approximately 110,000 volumes. Among the important gifts received during the year was \$5000 a year for three years, beginning January, 1931, for museum purposes from the Carnegie Foundation. President, John Clinton Futrell, LL.D.

**ARMAMENTS, LIMITATION OF.** See **DISARMAMENT**; **NAVAL PROGRESS**; **MILITARY PROGRESS**; **GREAT BRITAIN, FRANCE, AND ITALY** under *History*.

**ARMENIA.** The name applied, since Dec. 2, 1920, to the Socialist Soviet Republic of Armenia. On Jan. 16, 1923, Armenia became one of the three constituent republics of the Transcaucasian Socialist Federated Soviet Republic (q.v.), which is a member of the Union of Soviet Socialist Republics. Capital, Erivan, with a population of about 75,000 in 1929.

Occupying the southwest frontier region of Transcaucasia, and bounded by Turkey and Persia on the west and south, respectively, Armenia has an area of 11,945 square miles and a population of 1,032,700 (Jan. 1, 1931). About 120,800 pupils are enrolled in elementary schools. The country is essentially agricultural, with a cultivated area of about 1,000,000 acres in 1929-30, including more than 44,000 acres devoted to cotton. On Aug. 1, 1931 the collective farms equaled 26 per cent of the peasant farm total. In the first ten years of the Soviet régime, the construction of 187 miles of canals placed 900,000 acres of land under irrigation. Ten new hydro-electric plants were constructed also. The production of Armenian state industry (1929-30) was valued at 49,000,000 rubles (1 ruble equals about \$0.515 in the Soviet Union). See **UNION OF SOVIET SOCIALIST REPUBLICS**.

**ARMIES.** See **MILITARY PROGRESS**.

**ARMITAGE-SMITH, SIR SYDNEY** ARMITAGE. A British financial expert, died in London Oct. 31, 1932. Born Sept. 3, 1876, he attended New College, Oxford, and was a fellow of University College, London. He entered the service of the Treasury in 1902 and was appointed in 1908 private secretary to the Chancellor of the Exchequer. He was a member of the West African currency committee during 1911-12, secretary to the Royal Commission on Civil Service during 1912-14, and assistant secretary of the Treasury in 1913. In 1918 he was appointed a member of the Royal Commission on Decimal Coinage and in 1919 of the Royal Commission on Income Tax. He represented the British Treasury at the Paris Peace Conference in 1919. During 1920-21 he was financial adviser to the Persian government, receiving in recognition of his services the Grand Cordon of the Order of the Lion and Sun of that government. In 1924 he

was appointed secretary-general of the Reparation Commission, which office he held until 1930. He served also on the financial missions to the Leeward Islands and St. Lucia in 1931 and to Tanganyika Territory in 1932. He was created a Companion of the Bath in 1918 and a Knight Commander of the Order of the British Empire in 1929.

**ARSON.** See **CRIME**.

**ART EXHIBITIONS.** *The Tenth Olympiad.* Outstanding among the exhibitions of the year, because of size and unique character, was the exhibition of **ART IN RELATION TO SPORT**, held in connection with the Tenth Olympic Games in Los Angeles, from July 30th to August 31st. This exhibition comprised over 1100 works—oil paintings, water colors, drawings, prints, sculpture in the round and in relief, medals, architectural designs and models, and a few examples of the decorative arts by artists and craftsmen of thirty-two nations.

To an extent the exhibits were hung in national groups. The collection, exceedingly varied, and upheld to a high standard of artistic merit, occupied fifteen galleries, the rotunda, foyer and the main halls of the Los Angeles Museum of History, Science and Art, Exposition Park, which is opposite to and not far distant from the great stadium in which the Olympic field and track events took place. Almost all of the works included in this exhibition were by living artists, produced within the last four years, and of subjects pertaining to sport. A few amplifying exhibits—works by great deceased artists—were included as loans from public museums and private collectors, but these did not compete for honors. The exhibition was assembled by the Olympic committees of the several nations, under the auspices of the International Art Committee of the Olympic Games and the direction of the American Federation of Arts.

Prizes in the form of medals and diplomas were awarded by international juries in Architecture, Painting, Sculpture, Music and Literature. These awards were ceremoniously announced in the stadium in precisely the same manner as were the awards for athletic contests. An illustrated catalogue of the exhibition was issued. The attendance during the four weeks that the exhibition was on view exceeded 348,000 persons.

*George Washington Bicentennial.* The Two Hundredth Anniversary of the birth of George Washington was celebrated in the National Capital and in other cities by special exhibitions, pageants, etc. In Washington there were two principal exhibitions—one in the **CORCORAN GALLERY OF ART**, the other in the **NATIONAL GALLERY OF ART**, United States National Museum. The former assembled by a special committee of experts, consisted of portraits of "George Washington and his official family," and included works lent from public and private collections, chiefly by early American portrait painters of distinction. The latter was prepared at the request of the National George Washington Bicentennial Commission by the National Commission of Fine Arts and consisted of several group exhibitions. These groups were a series of commemorative mural paintings illustrating the life of George Washington by members of The Mural Painters of New York; a collection of works in sculpture by American sculptors assembled by the National Sculpture Society, indicative of progress in this

art during the last hundred years; a collection of 132 large photographs of works in architecture, painting, sculpture, and landscape architecture by Fellows of the American Academy in Rome assembled by the Alumni Association; and a series of plans, drawings, and photographs showing the development of the National Capital, a contribution from the National Park and Planning Commission and the National Commission of Fine Arts. These exhibitions both opened on the 22d of February and continued through Thanksgiving Day.

The METROPOLITAN MUSEUM OF ART, New York, in commemoration of the Washington Bicentennial, opened in February a special exhibition of Washingtoniana. This exhibition was set forth in the Ball Room from Gadsby's Tavern at Alexandria, Va., which now forms a part of the Museum's American Wing and continued until November 27.

An especially interesting exhibition appropriate to the occasion was shown also at YALE UNIVERSITY. The MINNEAPOLIS ART INSTITUTE and the MUSEUM OF FINE ARTS, Boston, both made memorial contributions in the way of special exhibitions.

A commemorative portfolio of twenty etchings by twenty of America's most distinguished etchers entitled "The Bicentennial Pageant of George Washington," illustrating scenes in the life of Washington from boyhood to his last days at Mount Vernon, was issued in an edition of a thousand copies with an introductory essay and biographical notes. The first copy of this portfolio was presented to the President of the United States, Herbert Hoover. Simultaneously, the etchings were publicly exhibited at Kennedy and Co.'s in New York.

*Indian Tribal Arts.* A comprehensive exhibition of Indian Tribal Arts was assembled by a self-organized committee of experts and shown first at the GRAND CENTRAL ART GALLERIES in New York, later in a number of the leading museums in other cities, with the purpose of demonstrating to the public the cultural instincts and achievements of various tribes of American Indians. A portion of this exhibition was shown in the U. S. Gallery at the Venice Biennial Exhibition during the Summer, creating much interest.

The exhibition of *Mexican Arts*, organized by the AMERICAN FEDERATION OF ARTS through the coöperation of the Carnegie Corporation of New York and the late Dwight Morrow while Ambassador to Mexico, which had been on circuit for more than a year, continued on its travels during the first half of 1932, spreading the knowledge of the native arts of Mexico and increasing the vogue therefor.

An Argentine painter, *Quiros* by name, held, by special invitation, an exhibition of his works in the MUSEUM OF THE HISPANIC SOCIETY, New York, the latter part of March and the early part of April, calling forth much favorable comment and introducing to art lovers in this country the works of a South American of exceptional interest and quality.

In the BROOKLYN MUSEUM, under the direction of William Henry Fox, an exhibition which gave an exceedingly interesting survey of *Modernism* in America from 1880 to 1900 was held, in the early part of the winter. Included in this exhibition were works by the leading American artists of those twenty years, many of whom had not theretofore been regarded in this par-

ticular category but whose works, when brought together, gave indication of modern trends. Many of the paintings in this exhibition were private loans.

A memorial exhibition of paintings by the late *Sir William Orpen* was held in the KNOEDLER GALLERIES, New York, re-emphasizing the brilliance of this lately deceased Irish painter, introduced to American art lovers, incidentally, by the International Exhibitions at the Carnegie Institute, Pittsburgh.

Witnessing again to the increasing wealth of American collections in foreign works, an exhibition entitled "From Van Dyck to Lawrence," held at the NEWHOUSE GALLERIES, New York, was significant.

Indicative of the continued interest in the works of the *French Modernists* were two exhibitions shown in New York during the first half of the year. One was entitled "From Cezanne to Picasso" and comprised eighteen carefully selected paintings. This was shown in the DUDENING GALLERIES. The other was at DURAND RUEL'S, and consisted of works by Gauguin, Cezanne and Redon—all exceptionally fine examples.

Because of the financial depression and resultant need, several notable exhibitions were held in New York during the year for the benefit of various charitable funds. The first of these was an exhibition of recent portraits by Philip de Laszlo, the Hungarian-British portrait painter, which was held at KNOEDLER'S in January. Later, in these same galleries, was to be seen a notable exhibition of works by Renoir.

At AVERELL HOUSE, for the benefit of the Musicians' Emergency Aid Fund, twenty-two paintings from Lord Sackville's collection, Knole House, Sevenoaks, Kent, were placed on view prior to sale.

At the AMERICAN ART ASSOCIATION-ANDERSON GALLERIES, New York, a loan exhibition of *portraits by distinguished painters* was shown for the benefit of the Free Milk and Coffee Stations for the Unemployed. And under the auspices of the Women's Division of the Architects Emergency Committee for Unemployed Architects and Draftsmen (to aid whom a fund of \$100,000 was raised) an exhibition of Architects' Hobbies was held from May 25th to June 3d. It is not usual in this country for admission fees to be charged to exhibitions in dealers' galleries, but under these circumstances the public gladly paid the price and, aside from aiding the charity, were well rewarded by the excellence of the works shown.

At the METROPOLITAN MUSEUM OF ART, New York, a *Memorial Exhibition of works by Samuel F. B. Morse* was held in February in the Gallery of Special Exhibitions, marking the 100th anniversary of the invention of the telegraph. Later in the Spring commemorative ceremonies were conducted at the Capitol in Washington.

In November, and for a period of six months, the METROPOLITAN MUSEUM OF ART, placed on view in its gallery of Special Exhibitions, the valuable collection of paintings and objects of art collected by the late *Colonel Michael Friedsam*, and presented by his executors, in accordance with his wishes, to the Museum early in the year.

At the WHITNEY MUSEUM, New York, from October 18 to November 16th, a memorial exhibition of the works of Glenn O. Coleman, who died in May was held.

"DUCHESS DE POLIGNAC"

By Vigee Lebrun

From the Curizon Collection Sold in New York City in 1932

This Museum opened on November 22 its first Biennial Exhibition of Contemporary American Art from which extensive purchases were made for its permanent collection from a \$20,000 fund donated by Mrs. Whitney for the purpose.

In recognition of fifty years of distinguished achievement in painting, the American Academy of Arts and Letters set forth in its Galleries, Broadway and 55th Street, New York, in November to continue to the following April, a comprehensive exhibition of the work of Gari Melchers, a member of the Academy and one of the country's most distinguished artists. Mr. Melchers, whose death occurred less than a month later, was present at the opening on November 6, at which time the American Institute of Arts and Letters, affiliated with the Academy, awarded to him its medal for distinguished achievement in art.

Despite the depression, professional art organizations, such as the National Academy of Design, New York, the Pennsylvania Academy of the Fine Arts, Philadelphia, the water color clubs and societies, and the print clubs, all held their annual exhibitions as usual. Fewer sales were made, but attendance was increased, apparently, rather than diminished.

The PENNSYLVANIA ACADEMY OF FINE ARTS, the oldest art organization in the United States, held its 127th Annual Exhibition from January 2d to March 21st, and the following prizes were awarded: Temple Gold Medal, to Paul Bartlett for "The Sand Barge"; Lippincott Prize, to Hilda Belcher for "Portrait by Night"; Mary Smith Prize, to Virginia Armitage McCall for "Waldron Academy, Overbrook"; Beck Gold Medal, to Saul for "Child with Instrument"; George D. Widener Memorial Gold Medal, to C. P. Jennewein for "Indian and Eagle," to be erected at Tours, France, as a memorial by the United States; James A. McClees prize, to A. Stirling Calder for his monument to Shakespeare to be erected in Philadelphia on the Parkway.

The NATIONAL ACADEMY OF DESIGN held (as has been customary since its merger with the Society of American Artists) two exhibitions during the year,—one the 107th Annual in the Spring; the other, known as the Winter Exhibition, in late November and December. The prizes awarded at the former were: First Altman prize, to Victor Higgins for "Winter Funeral"; Second Altman prize, to George Oberteuffer for "The House of the Rabbi"; the Thomas B. Clarke prize, to Robert Brackman for "Portrait"; the Ellin P. Speyer prize, to Ralph H. Humes for "Wounded Crow"; Second Hallgarten prize, to Joseph Schlaikjer for "Little Ones"; Third Hallgarten prize, to Carl W. Peters for "Barnyard"; and the Isaac N. Maynard prize, to Mahonri Young for a portrait bust of Emil Carlsen. The First Hallgarten prize was not awarded for the year 1932.

This was followed by the so-called Winter Exhibition of the National Academy of Design which opened on November 26 and continued to December 20. Prizes totaling \$3650 were awarded as follows: Carnegie prize, \$500, to the Gifford Beal for his painting "Northeastern"; Thomas R. Proctor prize, \$200, to Kenneth K. Forbes of Toronto for his portrait of "Captain Melville Millar"; first Altman prize, \$1000, to Leon Kroll for "Summer, New York"; second Altman prize, \$500, to Wayman Adams for portrait of "George (Pop) Hart"; Julia A. Shaw memorial prize,

\$100, to Katherine M. Johnson, Oswego, N. Y., for "From a Provincetown Roof"; Isador medal to Paul Sample of Pasadena, Calif., for "Unemployment"; the J. Francis Murphy memorial prize, \$150, to Donald Teague of New Rochelle, N. Y., for "Eastern Point Light"; Edwin Palmer memorial prize, \$1000, to Charles H. Woodbury of Boston, Mass., for "The Changing Wind"; as well as two prizes in Sculpture—the Elizabeth N. Watrous gold medal to John Flanagan for "Frame of Medals," and the Helen Foster Barnett prize, \$200, to Katherine W. Lane, Manchester, Mass., for "Narcisse Noir."

The Art Institute of Chicago held its Annual Exhibition of American Paintings and Sculpture from Oct. 27, 1932 to Jan. 2, 1933, and the following awards were made: The Mr. and Mrs. Frank G. Logan Medals and Purchase Prizes of \$1500, \$1000, and \$500 were awarded respectively to Nicolay Cikovsky for "Pigeons," to Sidney Laufman for "Landscape," and to Judson Smith for "A Deserted Mill"; the Norman Wait Harris Silver Medals and Prizes of \$500 and \$300 each were awarded respectively to Henry Varnum Poor for "Hudson Valley at Bear Mountain," and to Simka Simkhovitch for "Amazon Carrousel"; the M. V. Kohnstamm Prize of \$250 was awarded to Raphael Soyer for "Subway"; the Martin B. Cahn Prize of \$100 to Laura Slobo for "Sixth Street—4 p.m."; the William R. French Memorial Gold Medal to Victor Higgins for "Winter Funeral."

The Corcoran Gallery of Art, Washington, D. C., opened on December 4, its Thirteenth Biennial Exhibition of Contemporary American Paintings, consisting of 345 works by 281 artists. The following awards were made: W. A. Clark first prize, \$2000 and Corcoran gold medal to George Luks for "Woman with Cat"; W. A. Clark second prize and Corcoran silver medal to John R. Grabach for "Spring Planting"; W. A. Clark third prize and Corcoran bronze medal to David Silvett for his portrait "Thornton Nye of Wytheville, Va."; honorable mention and \$500 to N. C. Wyeth for "In a Dream I Saw Washington." From this exhibition the Corcoran Gallery purchased the paintings receiving the first and third prizes and also paintings by John Sloan, "Yeats at Petit Pas," and by Alexander Brook, "Portrait of My Wife."

Innovations brought about by the depression were open air exhibitions and barter sales held in New York and elsewhere. The first in this country was held in Washington Square, New York. During a period of nine days the total receipts amounted to over nine thousand dollars, upwards of sixteen hundred works being sold. Later similar sales took place in Cleveland, Chicago, and elsewhere. In some instances works were bartered rather than sold, the artists taking in exchange for their paintings, clothing, food, and professional services.

**FOREIGN. England.** A great exhibition of French Art was held at Burlington House, London, in January. Loans were made by the Louvre, French Abbeys, and Cathedrals, and by private and public collections. Many distinguished works came from American collections. This exhibition gave, it is said, an "unrivalled pictorial history of French art from the 12th century down to the present day," but one-third of the exhibits consisted of works of the 19th century.

Mr. C. H. Collins Baker resigned as Keeper of the National Gallery of Art, London, to ac-

cept a position in the research department of the Huntington Gallery, San Marino, Calif.

*Italy.* The American Academy in Rome, of which J. Monroe Hewlett, mural painter and architect, was appointed Director and assumed charge in the summer of 1932, held competitions for Fellowships as usual, and the following awards were made: In Painting, to James Owen Mahoney of Dallas, Tex.; in Sculpture, to Robert J. McKnight of Springfield, O.; in Architecture to George Nelson of Hartford, Conn.; in Landscape Architecture to Henri E. Channe of Tompkins Corners, N. Y.

In the Biennial Exhibition of Art in Venice, held during the summer of 1932, American art was again well represented. One gallery was given over to paintings by George Bellows, one to paintings by Arthur B. Davies, while a third gallery was devoted to the works of contemporary painters—Maurice Sterne, Gari Melchers, Charles W. Hawthorne, John Sloan, Robert Spencer, Maurice Fromkes, Frederick J. Waugh, Leon Kroll, Robert Henri, Hovsep Pushman, Leopold Seyffert, Walter Ufer, Randall Davey, Ernest L. Blumenschein, Max Weber, and Bernard Korf. A group of animal subjects in sculpture by Herbert Hazeltine was also included. The collection was assembled by Martin Birnbaum under the auspices of the Grand Central Galleries, New York, and the patronage of George D. Pratt.

The First International Art Congress was held in Venice simultaneously with this Biennial Exhibition and was attended by representatives of nine European countries. The object of this Congress was to consider practical problems. A number of recommendations were made which it is hoped will be embodied in bills to be introduced to various parliaments.

*The Netherlands.* The University at Amsterdam celebrated its tercentenary by an exhibition of works by Rembrandt, which opened on June 11th. The collection, which was assembled by F. Schmidt Degener, consisted of 42 paintings, 178 etchings and 122 drawings.

*Spain.* The Government of Spain, in an endeavor to safeguard its art treasures, passed certain laws, forbidding the export of works of Spanish art or their sale to foreigners, and has set aside its cathedrals and other great buildings as national monuments under Government control.

*Germany.* The German Federation of Arts called world attention to the danger of unskilled restoration of old paintings, asking for a law to license restorers only upon evidence of competence, and to restrain those who are incompetent from undertaking commissions.

*France.* A portrait by the late Thomas Eakins, entitled "Clara" was given by the Pennsylvania Museum to France, gratefully accepted and hung in the Louvre. The American School of Fine Arts at Fontainebleau celebrated its Tenth Anniversary during the summer of 1932. A museum at Meudon on a hilltop near Rodin's former home has been given to France by Mrs. Jules Martbaum of Philadelphia to house a collection of casts of work by Rodin. The official dedication is to take place in the spring of 1933. See ART MUSEUMS; ART SALES; PAINTING.

**ART EXHIBITIONS FOR CHARITY.** See ART EXHIBITIONS.

**ARTIFICIAL SILK.** See RAYON.

**ARTILLERY.** See MILITARY PROGRESS.

**ART INSTITUTE OF CHICAGO.** See ART MUSEUMS.

**ARTISTS.** See MUSIC; PAINTING; SCULPTURE.

**ART MUSEUMS.** The art museums of the country suffered quite generally from reduced budgets during the year. The Detroit Institute of Arts, which is supported entirely by city funds, was at one time in danger of closing. This calamity, however, was averted, but the activities of the museum were reduced and the Director, Dr. William R. Valentiner, at his request, was granted a year's leave of absence without pay for special research in Europe.

The Carnegie Institute of Pittsburgh did not hold its usual yearly International Exhibition. The Pennsylvania Museum of Art in Philadelphia was only open three days a week for the greater part of the year. The Butler Art Institute of Youngstown, O., was open only one or two days a week. Beginning October 1st, the Phillips Memorial Gallery in Washington was open only on Saturdays.

The Berkeley Museum, Berkeley, Calif., supported by memberships, the local Chamber of Commerce, and the city, was obliged to close on account of lack of funds.

Despite this discouraging curtailment of museum activities, quite a number of important accessions were made by American museums, either through gift or purchase.

The Art Institute of Chicago was greatly enriched through the bequest of the late Martin Ryerson, who left to the Institute his entire collection of rare and valuable paintings. A large portion of this collection had for some years been on view in the Institute as a loan. To his widow he left a life interest in the works remaining in the home.

The permanent collection of the Art Institute of Chicago was further enriched through a bequest from Mrs. L. L. Coburn of French paintings, books for the Ryerson Library, and a third interest in her residuary estate.

Princeton University acquired by bequest of the late Junius Morgan (who died on August 18th in Switzerland) his valuable collection of prints, engravings, and etchings.

The Parrish Memorial Art Museum at Southampton, L. I., was left one-half of the residuary estate of the late Samuel Parrish, its founder and former President.

To the Pennsylvania Museum, John T. Morris bequeathed a fund of \$25,000, the income of which is to be used for the purchase of objects of merit and rarity for the Museum.

The Metropolitan Museum of Art received money from five bequests amounting to \$59,000, as well as special gifts of unnamed sums from a number of donors.

Amherst College received from Mr. George D. Pratt a number of paintings and several works in sculpture by contemporary American artists.

From Mr. Edward S. Harkness Yale University received an Elihu Yale Tapestry woven by John Vanderbank about 1700, the last of a series of four Chinoiserie Tapestries, ordered originally as a wedding present for Yale's daughter Catherine, who married Dudley North, Baron Guilford. Yale University also received from Mr. Francis P. Garvan, in memory of Harry Payne Whitney, "The Whitney Collection of Sporting Art," comprising prints, paintings, drawings, and sculpture, representing almost every sport; and through the bequest of the late Chauncey M.

Depew, Jr., a portrait of George Washington by Gilbert Stuart.

The Philadelphia School of Design for Women, through merger with the Moore Institute of Art, Science, and Industry, received \$3,000,000 endowment, provided for in the will of Joseph Moore, Jr.

For the year ending Sept. 30, 1932, the Carnegie Corporation of New York reported gifts and grants in the field of art in the United States amounting to \$414,000. These were distributed as follows: \$79,000 to college art departments for instruction and equipment; \$196,000 to museums and art institutions; and \$137,000 for other activities outside of these two groups.

The Kansas City (Missouri) Art Museum, which has not yet opened, acquired, among other works, important paintings by Ingres and Chardin; a Boilly, a Cranach, a Lorraine, and a Dou.

Among the purchases made by the Cleveland Museum of Art was a relief plaque of a Singing Boy by Luca Della Robbia. This was purchased from the Dreyfus Collection, which was exhibited at the Fogg Art Museum, Cambridge.

The Toledo Art Museum acquired a still life painting by Emil Carlsen. This Museum also acquired, through the Holden Fund, a painting by Filippino Lippi of "The Holy Family with St. Matthew and St. John."

The Cincinnati Museum acquired a fine El Greco—"The Crucifixion, with View of Toledo."

The Department of Fine Arts, Carnegie Institute, Pittsburgh, acquired a portrait by Sargent of Homer Saint-Gaudens and his Mother.

The Museum of Fine Arts, Boston, acquired a portrait of the Poet, Gongora, by Velasquez, painted in 1622; also a portrait of Mrs. Gilbert L. Parker by Thomas Eakins.

A painting by Pietro di Cosimo was purchased by the Wadsworth Athenaeum, at Hartford, Conn.

The Minneapolis Art Institute purchased a Roman marble figure of Agrippina, the younger, of the Augustine period, and also a landscape by Ruissdael.

The New York Metropolitan Museum of Art acquired an Archaic Greek statue of Apollo type, of about 600 B. C., and a famous Greek terra cotta—an ancient reproduction, a little less than a quarter life size, of Diadoumenos by Polykleitos. Thirteen paintings by contemporary American artists were also acquired for the Museum's permanent collection.

The Ranger Fund for the purchase of works by American artists, administered by the National Academy of Design, acquired nine paintings during the year 1932: works by Robert Henri, Leopold Seyffert, Jonas Lie, Frederick C. Frieseke, Eugene Higgins, Wayman Adams, Bruce Crane, Jerome Myers, and Eric Hudson, which were assigned to various art organizations throughout the country. Announcement was made that during the last three years, despite the depression, the Academy had succeeded in increasing this fund of \$250,000 to nearly \$400,000 through judicious investment.

In December the following additional purchases were made from the Ranger Fund: "Room in Arlington Museum," by Charles Bittering; "Rhododendron," by Herman Dudley Murphy; "Pale Light of Dawn," by Spencer Nichols; "The Benediction of the Sea," by John Noble; "The Path of Light," by Malcolm Humphreys; "The Blue Jar," by Cullen Yates; "Mist and Snow,"

by Walter Palmer; "Last Snow," by Theodore van Soelen.

Two new museums came into existence. These are the Lyman Allyn Museum in New London, Conn.; and the Museum of Art in Eugene, Oregon (dedicated in June), a memorial to a former president of the University of Oregon—P. L. Campbell. The Lyman Allyn Museum is two stories high, designed in classic style, with eight galleries and an auditorium, with seating capacity for two hundred, in the basement. The building, formally opened on March 2d by Governor Wilbur L. Cross, was the gift of Mrs. Harriet Upson Allyn in memory of her father, Lyman Allyn. It will specialize in its collections in drawings, prints, and small works in sculpture and objects of industrial art.

The Museum of the City of New York, recently erected at 104th Street and Fifth Avenue, was formally opened to the public on the 11th day of January. It is a handsome white marble structure in the Georgian style, designed by Joseph H. Friedlander, and contains interesting exhibits relating to the history of the City of New York. An interesting feature of this museum is a series of models of scenes in old New York by Dwight Franklin.

The Museum of Modern Art, New York, which for some years has had quarters in the Heckscher Building, 730 Fifth Avenue, moved on May 3 to 11 West 53d Street, formerly a private residence, which has been admirably remodeled for museum purposes. In November this museum continued its enviable reputation for notable exhibitions by a display of American works of extraordinary importance including Whistler's portrait of his mother, lent by the Louvre.

The Toledo Museum of Art has completed two large wings which triple its size. These additions were made possible through the bequest of \$2,000,000 in the will of Edward Drummond Libbey, the museum's founder and first president, and construction was begun in 1930 at the request of the donor's widow to help relieve the local unemployment situation. During the ensuing years, 2500 men worked on the buildings. In one of the new wings is a concert hall seating 1500 persons. The other wing provides exhibition galleries and quarters for the Museum School of Design.

Extensive additions were made to the Worcester Art Museum, Worcester, Mass., during 1932. Its new buildings, greatly increasing the size of this museum, were not opened, however, to the public until Jan. 6, 1933.

A new museum building at Springfield, Mass., has been in the process of erection. Announcement was made in the late summer of 1932 of the appointment of Josiah P. Marvel as director of this museum, which will be under the control of the Springfield City Library Association.

Ground was broken on October 10 for the erection of the new Avery Memorial Building of the Wadsworth Athenaeum, Hartford, Conn., which will adjoin the present structure of the Morgan Memorial. This new addition to the Wadsworth Athenaeum will make possible a more adequate housing of the administration and exhibition needs of the museum, and will also provide quarters for the Hartford Art Society.

The Taft Museum, Cincinnati, formerly the residence of the late Charles P. Taft, and containing his rare and beautiful collections was opened to the public on November 29 as a mu-

seum, under the charge of the Cincinnati Art Museum.

The Washington County Museum of Fine Arts was opened in Hagerstown, Md., in May, the gift of Mrs. W. H. Singer, Jr. An annual maintenance fund of \$5000 is given by the county.

Fort Dodge, Ia., dedicated a new \$40,000 gallery, the gift of Charles Blanden of San Diego, Calif.

On Oct. 30, 1932, Yale University celebrated appropriately the Hundredth Anniversary of the establishment of the "Trumbull Picture Gallery"—the first separate art museum building connected with a college or university in this country and also a comparatively early building in the long history of museums.

The Museum of French Art, New York, held a noteworthy exhibition of 26 paintings and lithographs by Fantin Latour, assembled by Mrs. Chester Dale. Among the exhibits were also a number lent by the Louvre and public galleries at The Hague and other European cities.

In January, William Sloane Coffin was elected President of the Metropolitan Museum of Art, succeeding the late Robert W. de Forest. Mr. Coffin had served for seven years as a member of the Board of Trustees of the Museum, and for a much longer time had manifested a very keen interest in art and its development, especially in the field of industry. At the same time Herbert E. Winlock, who had been associated with the Metropolitan Museum for twenty-five years, and had served as Curator of its Department of Egyptian Art since 1929, was made Director. Mr. Joseph Breck was appointed Assistant Director, and Director of the Cloisters. Simultaneously with the announcement of these appointments announcement was made by the Trustees of the acceptance of the Michael Friedsam bequest, an important varied collection which eight months later—that is in November, 1932—was placed on public view.

The Pennsylvania Museum of Art, Philadelphia, was greatly enriched by the loan of a collection comprising a notable group of English portraits, works of sculpture, textiles, furniture, porcelains, and other *objets d'art* from Mr. and Mrs. Edward T. Stotesbury. This Museum and the Metropolitan Museum of Art, New York, continued during the early part of the year, through the generosity of various donors, chamber music and symphony concerts.

The practice of installing whole rooms in museums as exhibits was continued and emphasized during the past year by the addition, in April, of the so-called Chesterton Room to the Baltimore Museum of Art, a beautiful example of Colonial architecture; and the installation of two rooms from the Joel Clark House, built at East Granby, Conn., in 1737, in the Yale Museum of Fine Arts, New Haven. Also, on May 5, a Queen Anne Room was opened in the Minneapolis Institute of Arts, adjoining a Georgian Room from Stanwick Park, Yorkshire, installed the first of the year in memory of Eugene J. Carpenter. The Pennsylvania Museum opened in the yearly autumn a Louis XVI room from the Hotel Letellier, Paris, 1789, the gift of Mrs. Alexander Hamilton Rice, and in mid-summer, St. Louis opened an interesting Gothic Court with imposing early XVI century staircase.

**ART SALES.** Sales of paintings and other works of art were held with the usual regularity in this country and abroad. Although the gen-

eral scale of prices was not as high as for some years past, some interesting peaks were reached.

In the American Art Association-Anderson Galleries, New York, three notable collections were sold last April. These were the Curzon, the Sir W. H. Bennett and the Benguiat Collections which collectively totaled \$432,585. The Curzon collection alone brought \$93,673 and included on its lists the painting "Vénus Consolant L'Amour," one of a series of decorations which Louis XV commissioned Boucher to paint for Mme. de Pompadour, which brought \$31,000; and also Vigée Lebrun's portrait of Duchesse de Polignac painted in 1782 which brought \$16,500, as well as a portrait by Sir Joshua Reynolds of Katherine Angelo which brought \$12,000 and two heads by Greuze, one of "A Girl" and the other of "A Boy," which brought respectively \$4600 and \$5200. The Benguiat collection comprised exclusively antique oriental rugs, and included a Royal Persian Animal Carpet of the 16th Century, one of the great carpets of the world, for which the owner is said to have declined \$250,000. This carpet sold for \$62,000. A "Marquand" Imperial Animal rug, described by Mumford and well known throughout the world, brought \$35,000. The total for this sale was \$245,775. The Bennett collection which included some fine examples of the great school of English portraiture brought \$98,137, but no one item an extraordinary amount. Included in this collection were two Italian Renaissance bronzes which sold respectively for \$6500 and \$6100.

Much interest was aroused by the sale of the "Blue Boy" in the Hearn Collection. This painting was originally supposed to have been a replica by Gainsborough, but it has also been ascribed to Hoppner. It brought \$8500. The next highest price in this sale was given for an interior of "Fitz-Allen Chapel" by Turner which sold for \$4500.

Earlier in the season four busts in plaster by Houdon brought a total of \$8950, one of George Washington, supposed to be an original cast, selling for \$4500 and one of Benjamin Franklin for \$3000.

Works by American artists in most instances did not in 1932 bring sensational prices. The sum of \$2100 was paid for a portrait of Mary Todd Lincoln by Francis B. Carpenter; a "Moonlight" by Blakelock brought only \$700, while a painting by Ridgway Knight brought \$1000; two portraits in pastel by Sharples brought \$500 each; a water color, "Sisters at Work" by Winslow Homer, in the Fletcher Collection, brought \$1550, and a Venetian painting by Thomas Moran, \$1600.

One of the high prices of the season in New York was paid for a painting by Rembrandt, "Woman Plucking Fowl" at the sale of the Kleiber Collection on November 18, the price being \$26,000. At this same sale "Concert" by De Hooch brought \$7500 and a Goya portrait \$5400. Earlier in the year a painting of a "Young Girl" by Matisse brought \$950, and "The Old Carpenter" by Manet only \$600.

Many of the sales in these galleries during the past season were of furniture—early American, English, and in some instances French. No such sensational prices were given, however, as a few years ago, and the general level was much lower. The highest price, \$3800 was paid for a card table by John Goddard of Rhode Island. Next in amount was a side table with a marble top made

in Baltimore about 1790, for which \$2350 was paid. A Duncan Phyfe side chair brought \$1820, a Duncan Phyfe sofa \$1050, and a Duncan Phyfe settee \$950. For a Chippendale carved mahogany four-poster bed \$900 was paid, for a high-boy by William Savery of Pennsylvania, \$750. Banjo clocks in some instances brought as high as \$450. For a Washington Card table said to have been used at Mount Vernon, \$560 was paid. Two American hooked rugs, one oval, brought respectively \$350 and \$280 apiece.

In this connection it is interesting to note that French and Flemish tapestries sold at from \$1000 to \$3000 each during the past season, whereas single lengths of Genoese velvet brought from \$520 to \$770.

In these same auction rooms during this season three famous violins were sold—a Stradivarius at \$14,000, one Guarneri del Gesu of 1729 at \$15,500 and another of 1742 at \$16,000. Also, incidentally, \$21,500 and \$43,000 were bid (and paid) for two diamond rings, and \$20,500 for a pearl necklace.

On account of financial stringency and heavy taxation, famous English masterpieces long in the possession of old-established families of Great Britain continued to come into the market both in this country and in England, but the prices brought in 1932 were much lower in England than heretofore. In connection with the sale on April 18 of Lord Durham's Collection at Lambton Castle, much interest was created and comment made by the owners' refusal to accept a bid of £95,000 for "The Red Boy" by Lawrence, a portrait of Master William Lambton, and £23,000 for Hoppner's portrait group of Lady Anne Lambton and her family, although the latter bid was £5000 higher than a work by Hoppner had ever brought. Romney's portrait of General Lambton was bought in by the owner at £9500.

Interesting figures were given in connection with a report of the sale of the collection of the late Sir Ernest Cassel in London in the early summer, when Renaissance bronzes, which had been purchased for 700 guineas in 1912, when the guinea was worth about \$5, sold for only 170 guineas, with the guinea worth less than \$3.80. A Louis XIII bronze group which previously brought 1550 guineas went for 620 guineas. A large well-known group portrait of the Warren Family by Romney which was sold at the Lord Vernon auction in 1919 for 6600 guineas brought only 1100 guineas.

The same was true of prices at another well-known London auction room where six portraits by Raeburn brought a total of £2290, while the price paid for a seventh, "Portrait of Helen Boyle," an especially important work, the property of the Earl of Glasgow, was only £3500. In 1917 £25,410 was paid for Raeburn's portrait "The MacNab." At Christie's, Reynolds' portraits of Mrs. Weddell and Viscountess Beauchamp failing to reach the desired figure, were bought in at 1300 and 1700 guineas respectively. At another sale at Christie's, the same occurred in connection with a painting by Rembrandt, "Young Man with a Sword" which failed to reach the reserve, the highest bid being 2100 guineas. A portrait by Gilbert Stuart of Daniel McCormick, a friend of George Washington, was bought in for 360 guineas. Evidently the English realize that there is no use sacrificing family portraits unless their sale achieves the desired end of meeting death duties and tax obligations.

On the other hand, higher prices than usual prevailed in France. At a sale of works by French Impressionists and Post-Impressionists held at the Galeries Georges Petit, Paris, in the early summer, 3,300,000 francs or about \$132,000 was realized. The highest price paid was the equivalent of \$14,000 for Van Gogh's "Le Pont de Trinquetaille a Arles." A Renoir, "La Fillette au Cerceau," brought \$12,850, Cezanne's still life, "Pommes sur une Table" brought \$12,800, and his "Village Provençal," \$10,000. Works by Corot, however, at this same auction brought \$7260 and \$4400 respectively; a painting by Daumier \$5840 and a Monet \$3200.

In Berlin excellent prices were paid for work by modernists. In a November sale 15,600 marks was paid for "Woman Bathing" by Degas and 11,200 marks for a "View of the Alps toward Gausier" by Van Gogh; 16,000 marks for "Woman Playing Guitar" by Renoir. At a sale of engravings by old masters of the fifteenth and sixteenth centuries from well-known German collections, top prices prevailed. Prints by Altdorfer, "Fortuna" and "Mars," brought respectively 1100 and 950 marks, the highest price ever paid for figure subjects by this master. Early Italian prints also brought good prices, one going as high as 4800 marks. Dürer prints likewise were at a premium, "Adam and Eve" bringing 6100 marks, "The Passion," 2600 marks, and "The Big Fortune," 2700 marks. A Madonna by Mabuse brought 1300 marks, and Schongauer's "Nativity," 2000 marks. The sale of the Stinnes Collection showed increased interest in the works of the French painters of the nineteenth century. Prints by Maillot and Matisse brought good prices; also prints by Edward Munch, Norwegian painter.

Early in December the George Blumenthal Collection was sold in the Galeries Georges Petit, Paris, realizing a grand total of \$443,000, which was said to be a "particularly forcible and timely reminder of the quoted value of works of genuine merit." At this sale a painting "Donkey Stable" by Fragonard brought \$12,000. Two drawings by the same master \$5500 and \$4500 each. A table made by Reisener for Marie Antoinette fetched \$28,000, an ensemble by Clodion, \$18,000. Mr. Blumenthal's library alone brought nearly \$109,600.

**ASTRONOMY.** By modern photographic methods, dozens of new minor planets are annually being added to the more than 1200 that are already known. The great majority of these bodies are of no especial interest, but occasionally one of particular importance is found; and the year 1932 was distinguished by two noteworthy discoveries: On March 12, a rapidly moving object of the thirteenth magnitude was detected by Delporte at Uccle. The accurate determination of the orbit presented great difficulties, because the motion on the celestial sphere was nearly in a

great circle; and for some time it was uncertain whether the object was a comet, a planet, or a tiny new satellite of the earth. Eventually, however, the body was found to be a minor planet, and it received the temporary designation 1932 EA. The first of the two letters by which newly discovered minor planets have been designated since 1925 indicates the approximate time of discovery, the letter A being used for those found during the first 15 days in January, B for those found during the remainder of January, and so on; the second letter indicates the order of discovery, the first planet discovered in a given half month being designated by A, the second by B, and so on; I and J are treated as the same letter, and if more than 25 planets are found in any one period, the subscript one is appended, if more than 50 the subscript two, and so on. The Delporte planet later received the permanent number 1221, and the name of Amor. As a measure of preparedness in case of similar discoveries in the future for which the usual methods of orbit determination fail, Leuschner devised a special mathematical test for ascertaining whether or not a newly discovered body close to the earth is a satellite of the latter.

Amor passed within 10,000,000 miles of the earth, and thus replaced Eros as the earth's closest known neighbor next to the moon. It held this distinction for only a few weeks, however: On April 24, a still more remarkable minor planet, 1932 HA, was discovered by Reinmuth at Heidelberg. The Reinmuth planet came within 8,000,000 miles of the earth, and it is possible for it to come considerably closer. It has a period of less than two years, and is the first minor planet to be discovered with a perihelion inside the orbit of Venus; it is possible for it to transit the sun.

The Delporte and the Reinmuth planets are among the smallest bodies known to astronomy; they are probably less than a mile in diameter, perhaps only as large as a fair-sized mountain. Many such bodies undoubtedly exist in the solar system, but only those that happen to come quite close to the earth can be detected. These two planets would be invaluable for a more accurate determination of the solar parallax; but because of their faintness, they are observable only at favorable oppositions, and unfortunately it will be some time before favorable oppositions again occur; meanwhile, they are in danger of being lost entirely, because of a lack of accurate observations over a sufficiently long interval of time.

Since the minor planet Hidalgo goes out to the orbit of Saturn, the minor planets are now known to be distributed between the orbits of Mercury and Saturn, instead of being confined between the orbits of Mars and Jupiter as originally thought; there is even some question as to whether Pluto should not be classified as a minor planet, since it apparently has a mass too small to affect other bodies in the system appreciably. The distinction between major and minor planets on the basis of location in the solar system is thus being lost. The distinction between minor planets and comets has been uncertain for some time: An object discovered in 1913 by Neujmin had a planetary appearance, but was moving in an orbit which was then considered distinctly cometary; Barnard succeeded in detecting a faint coma and a diminutive tail, but at the return in 1931 the most powerful telescopes revealed no vestiges of either, and

had it been discovered then instead of in 1913 it would have been classified as a planet. The Delporte and the Reinmuth planets have cometary orbits; and Amor may well be identical with some one of the comets that have been observed in past years.

The disappearance of distinctions formerly considered to exist between different classes of bodies in the solar system increases the difficulty of forming any really satisfactory theory of the origin of the system. Thus, a recent determination of the mass of Neptune's satellite indicates that no distinction between planets and satellites can be maintained on the basis of size: It is well known that the masses of the celestial bodies are determined by observing the motions which are produced by the mutual gravitational pulls that the bodies exert on one another. If a planet has a satellite, the mass of the planet is easily determined by observing the motion of the satellite as controlled by the action of the planet; if a planet has no satellite, recourse may be had to the perturbations which the planet produces in the motions of the other planets. Similarly, if a planet has several satellites, then if they are massive enough to disturb one another's motions appreciably, their masses may be determined from these mutual perturbations; in this way, Mimas has been found to have a mass  $\frac{1}{2100}$  that of the moon, the smallest mass yet measured astronomically. Again, a planet which has only one satellite describes an orbit about the common centre of gravity of the two bodies, and is therefore regularly displaced back and forth relative to where it would be if there were no satellite; the location of the centre of gravity, and hence the mass of the satellite, may be found by observing this back and forth swing, provided the satellite is massive enough to produce an accurately observable displacement of the planet on the celestial sphere. (The motion of the earth about the centre of gravity of the earth and the moon produces an apparent oscillation of nearby objects on the celestial sphere, from which the mass of the moon may be determined.) It seemed probable that Neptune's satellite is massive enough to shift Neptune on the celestial sphere by an amount of the order of 0.03 second of arc, which is within the limits of modern photographic measurement, and hence an attempt was made at the Mount Wilson Observatory to observe this displacement; the result gave a mass for Neptune's satellite of about five times that of the moon. Hence, not only is this body the most massive satellite in the solar system, but its mass is greater than that of Mercury, and half that of Mars.

**CELESTIAL MECHANICS.** The principles which govern the motions of the celestial bodies under their mutual gravitational attractions were completely and exactly formulated by Sir Isaac Newton over 200 years ago. For seven generations, these motions have been investigated by the ablest mathematicians; but in many instances the motions are of such extreme complexity that numerous unsolved problems still remain: The motions of two bodies in space under their mutual gravitational attractions during all past and future time can be completely and exactly calculated; but a similar calculation for three or more bodies is as yet impossible: When three or more bodies attract one another, the influence of each one alters the relative motions of the others, and these changes react on their

attractions for one another in a manner that taxes the highest mathematical skill to follow; and no one has succeeded in fully solving the problem. Methods have been devised by which the motions of the bodies in the solar system may be calculated to any required degree of approximation over limited periods of time; but the astronomer can neither predict where any given planet will be hundreds of millions of years hence, nor trace back the motion with any degree of accuracy over such an interval of time. In particular, it is impossible at present to draw any definite conclusions as to the ultimate stability of the solar system; on the basis of certain approximations, Laplace showed that a system of planets moving around the sun in definite orbits might suffer many serious disturbances from one another's attractions, but still would always hold together and form a stable system, however, Laplace's approximations are not legitimate for periods of time greater than fifty million years at most.

While the general problem of three or more bodies has not been completely solved, a number of general qualitative theorems have been established; and certain special cases have been fully worked out. For example, Lagrange obtained a solution for the case of three bodies which move so as always to form an equilateral triangle; and among the minor planets, 10 are now known which form such triangles with Jupiter and the sun: These minor planets are known as the Trojan group, because they are all named after characters in the Trojan wars; the first to be discovered was called Achilles, and the succeeding ones Hector, Nestor, Agamemnon, Odysseus, Patroclus, Priamus, Æneas, and Anchises; a tenth member of the group, 1931 YA, was found by Reinmuth on Dec. 31, 1931, and was at first thought to be a comet. These bodies all move in the plane of Jupiter's orbit, at the same distance from the sun as Jupiter, and each keeps at a like distance from Jupiter, except for small periodic oscillations; the first five travel ahead of Jupiter, the other five following behind. Each one thus continually forms with Jupiter and the sun a great equilateral triangle, 483 million miles on a side.

In the case of most of the bodies of the solar system, however, it is the general problem, and not any such special case, that is involved; but for the major planets the problem is so much simplified, because of the smallness of their masses compared to that of the sun, that their motions can be calculated with great accuracy from existing mathematical theories. The theory of the motions of the satellite systems, on the other hand, is a much more difficult problem, and has not been so accurately worked out. In particular, the four great satellites of Jupiter constitute a formidable challenge to the mathematician; a new discussion of this system has recently been finished by de Sitter: The first three of these satellites exemplify another of those special cases of the problem of three bodies in which the bodies permanently maintain the same configuration—when two of the satellites are in a line on the same side of the planet, the third is in the same line on the opposite side, and Laplace showed that their mutual attractions compel them to move permanently in this way, except for small periodic oscillations about these positions; de Sitter finds that they should oscillate about the equilibrium positions in a period of six years,

but the magnitude of the oscillation is too small to be observed.

A comparison of the observed motions of Jupiter's satellites with the theoretical motions calculated by de Sitter shows irregular departures from theory similar to the small irregular departures exhibited by the moon, the earth, and the inner planets; and this confirms the recent conclusion of E. W. Brown and others that these discrepancies are due to fluctuations in the rate of rotation of the earth.

E. W. Brown has devised a mathematical test for ascertaining whether observed deviations of a planet from its calculated motion are due to perturbations by an unknown planet, or merely to errors arising from inaccurate orbital elements, inaccuracies in the calculated perturbations produced by other planets, and errors of observation. An application of this test to the observations of Uranus which were used by Leverrier and Adams in calculating the place of the then unknown planet Neptune shows that the deviations of Uranus from its theoretical path were actually due to the perturbations from the undiscovered planet; on the other hand, the deviations used by Lowell in predicting the existence of a trans-Neptunian planet are found not to be due to perturbations by another body, and hence it must be concluded that the agreement of Pluto's orbit with that calculated by Lowell is a chance coincidence, and that Pluto is not the body predicted by Lowell. Lowell's methods and calculations were sound; but he was forced to use the old observations of Uranus that were made before it was recognized as a planet, and these observations were not sufficiently accurate.

**EXTRAGALACTIC SYSTEMS** Two faint nebulae in Gemini have been found by Hubble to have an apparent radial velocity of recession of 15,000 miles per second, the highest yet observed. These systems are 135,000,000 light years distant.

Hubble has found 140 nebulous objects in or close to the borders of the Andromeda nebula, Messier 31, which, from their numbers, distribution, and radial velocities, are presumably associated with the great spiral; and from their forms, structure, colors, luminosities and dimensions, he has provisionally identified them as globular clusters. Their diameters range from 13 to 50 light years; they seem to be systematically fainter than the globular clusters in our own galaxy, but are comparable to those in the Magellanic Clouds. The diameter of the spiral indicated by the distribution of these objects is probably of the order of 100,000 light years. This discovery strengthens the general resemblance of the spiral nebulae and the galactic system.

With a photoelectric cell attached to the 100-inch reflector at Mount Wilson, Stebbins has determined the brightness and colors of various faint and distant objects, and has obtained evidence of considerable absorption of light in space; just as the setting sun appears red because of the greater amount of air we look through near the horizon than when the sun is overhead, so do the stars and clusters near the central line of the Milky Way appear reddened; the so-called space-reddening is due presumably to an extended cloud of small particles, gas or dust, which obstructs and scatters the light from stars in and beyond this region. Because of this absorption, some objects, such as the globular clusters, have perhaps hitherto been estimated to be as much as four times as far away as they really are—the

distances of these remote objects cannot be measured directly, and are estimated from their apparent brightness on the assumption that the intrinsic luminosities of the stars are the same as those of nearby stars with the same characteristics, and hence if there is an absorption of light in space it must be taken into account. At right angles to the Milky Way, the observations indicate relatively little absorption, and previously estimated distances need not be revised more than 10 per cent. The presence of the thin absorbing layer in the central plane of the galactic system is additional evidence that the group of a billion or more stars to which the sun belongs is similar to the spiral nebulae, instead of greatly surpassing the latter in size as previously thought.

**ASTROPHYSICS.** Only a few years ago, there was a long list of lines of unknown origin in the spectra of the hotter stars, the nebulae, the corona, the aurora, comets, and the outer planets; the advances in modern physics have now reduced this list to two outstanding examples—the unidentified lines of the solar corona, and the great bands in the spectra of the giant planets. At the same time, the advances in atomic physics have left practically no hope that these spectra can be ascribed to new elements, and hence they must be explained as due to familiar substances existing under conditions that have not yet been reproduced in the laboratory. T. L. de Bruin has announced that he has obtained evidence that some of the coronal lines are due to neutral metastable oxygen, but this has not yet been fully demonstrated. R. Wildt, from a study of the far infra-red spectra of the outer planets, finds some of the bands in the spectra of Jupiter and Saturn to be due to gaseous ammonia; and he has also found methane, or marsh-gas, in the atmospheres of Jupiter, Saturn, Uranus, and Neptune. The wide, hazy bands in these spectra must be due to thick, dense atmospheres; and since the surfaces of the outer planets are very cold, the atmospheres must consist of substances that remain gaseous at extremely low temperatures. The bands due to ammonia are absent from Uranus and Neptune, and much weaker in the case of Saturn than Jupiter; even at the temperature of Jupiter, most of the ammonia would freeze out as a snow, and on Uranus and Neptune it would all be in the solid form.

These studies of the infra-red spectra are carried out with the aid of photographic plates sensitized in the deep infra-red with a dye known as zenocyanine. These plates are sensitive so far into the red that they will take pictures in total darkness—a flatiron is easily photographed in the dark with its own heat; the dye must be synthesized just before being used, and the plates have to be kept in cold storage, or packed in ice, because the heat from the sides of an ordinary container at room temperature will fog the plates. With the aid of these plates, Adams and Dunham have detected carbon dioxide in the atmosphere of Venus.

The lines of ytterbium have been discovered in the solar spectrum. Merrill has found the auroral green line in the spectra of several novae.

**STARS.** Strömberg has completed an investigation of the distribution of visual absolute magnitudes for all stars of spectral types B, A, F, G, K, and M brighter than the sixth apparent magnitude; the method used is a statistical one, based on the distribution of parallactic motions and radial velocities. The results show conclu-

sively that there is a strong tendency for the absolute magnitudes to cluster around certain definite values; and five chains or sequences of stars, connecting the values about which they cluster, are revealed. These groups are known as the main sequence, normal giants, faint giants, bright giants, and supergiants. Two complete gaps between groups exist—one that separates the dwarfs from the giants in the later spectral types, and one that separates the normal giants or the main sequence from the bright giants in spectral classes B3 to G8; possibly the latter gap is a region of instability connected with Cepheid variation and novae.

**COMETS.** An exhaustive study of the phenomena shown by Halley's Comet at its return in 1909–1911 has been completed by Bobrovnikoff. This study confirms the growing conviction that the masses of comets have been underestimated in the past; the mass of Halley's Comet is estimated to be of the order of one ten-billionth that of the earth. The nucleus is proved to have exerted appreciable repulsive forces upon matter forming the jets; on several occasions changes of an explosive character were detected therein. The jets, composed of cyanogen, were actual matter being expelled; the nucleus showed repulsive forces of from one to six times gravitation; the envelopes expanded outward at the rate of about half a kilometer per second. The tail was double; one branch was directed almost directly away from the sun, the other making an angle of 40 degrees with this direction. The self-luminosity of the tail was mostly due to glowing carbon monoxide. The Bessel-Bredichin theory of cometary tails seems sufficient to explain the observed facts, although the theory requires amplification.

**PHENOMENA.** A total eclipse of the sun was witnessed over the northeastern United States on August 31; it was successfully observed by a number of expeditions, but was hidden by clouds over part of the path of totality. The next total solar eclipse visible in the United States will be on July 9, 1945; however, this and the two following ones in 1954 and 1959, will be visible only near sunrise; the next eclipse favorable for observation in the United States will not occur until July 20, 1963. Other favorable total eclipses will be visible in this country in 1970 and 1979.

An unusually good display of the Perseid meteors took place. The Leonid shower, on the other hand, was inferior to the 1931 display.

Of the nine periodic comets which were due to return in 1932, five were observed. viz., Grigg-Skjellerup, Kopff, Borrelly, Faye, and Brooks; in addition, seven new comets appeared.

**ATHLETICS, TRACK AND FIELD.** As a matter of course, all track and field athletes in 1932 were directed at the Olympics, and the grand climax came when the athletes of the nations of the world gathered at Los Angeles in August and battered existing records. But, in the general run of

the season, indoors and outdoors, leading up to the Olympics, there were many splendid performances. Foremost among all the athletes who flashed in 1932 was Gene Venzke, youthful distance runner from Pottstown, Pa., who startled the track world by his mile running on the board tracks in the winter. Venzke, who had been a consistent runner-up for two seasons, suddenly sprang to the fore in the Millrose A.A. games at Madison Square Garden and beat Lermond, former national champion, to the tape in world's record time of 4:11 $\frac{1}{4}$ . In his next appearance, at the New York Athletic Club meet on the same track, he smashed the record again and set the new mark at 4:10 (two seconds better than Paavo Nurmi's best time). The sensation of the indoor season was unaccountably beaten in New York in the early spring at 1500 meters and then failed to qualify for the Olympics at the tryouts held at Stanford University, Palo Alto, Calif., in July.

Leo Sexton, George Spitz, and Emmett Topino were the other outstanding performers of the indoor campaign. Sexton's consistent shot putting was fine and he topped off the season with a herculean heave of 52 feet 8 $\frac{3}{4}$  inches, a world's record. Spitz was unbeatable indoors, clearing 6 feet 8 $\frac{3}{4}$  inches, the greatest height ever reached, outdoors or indoors by a high jumper. He turned his ankle on cinders in the spring and he failed in the Olympic final. Topino, who spreadeagled all opposition at the sprints indoors and then was beaten in the 100-meter Olympic trial, showed his speed on the United States relay four. The New York Athletic Club, on the exploits of Sexton, John Anderson, discus thrower, Percy Beard, hurdler, and others won both the indoor and outdoor national team championships. The fifty-fifth annual Intercollegiate A.A.A. championships were held on the Pacific Coast (at the University of California, Berkeley, Calif.) for the first time. There it was that Bill Carr, unheralded U. of Pennsylvania runner, first beat Ben Eastman, Stanford star, in a 47-second quarter mile, over a new track, adjudged slow by the experts. The Carr triumph was the high spot of the meet, in which Eastman came back to win the Intercollegiate half mile title in 1:51.9 for a new I.C.A.A.A. mark. Joe Mangan of Cornell nipped Pen Hallowell, Harvard hope, in the last stride in the mile. The University of Southern California won its third straight team title with the remarkable total of 62 $\frac{3}{4}$  points.

Ten days later the athletes of the United States gathered at Palo Alto for the Olympic tryouts, considered the national championships in the Olympic year. Here Carr beat Eastman at 400 meters in the then record time of 46.9 (Carr lowered this in the Olympics). Bill Graber of Southern California, pole vaulted 14 feet 4 $\frac{1}{4}$  inches to top Bill Miller of Stanford after both had cracked the world's record at 14 feet 1 $\frac{1}{4}$  inches. Ralph Metcalfe, University of Marquette negro sprinter, nosed out Eddie Tolan, University of Michigan flier in both the 100 and the 200 meters. (This was reversed in Tolan's favor in the Olympics.)

George Barker of New York University won the Intercollegiate cross-country championship in New York City in the fall, and Manhattan College took the team title. Joseph McCluskey, wearing the colors of Fordham University, had a victory-studded year. He won the national in-

door and outdoor steeplechase titles, the intercollegiate indoor and outdoor 2-mile championships, and the national cross-country title. New York University, with Frank Nordell as the star of the team, carried off honors in the indoor intercollegiate in March at New York.

Women's track and field competition was merely the story of the feats of Mildred (Bahe) Didrikson of Dallas, Tex. In the final Olympic tryouts (the national championships) at Evanston, Ill. in mid-July, she won four first places, tied for first in one event, and carried off the team championship single-handed in the name of the Employers Casualty Company of Dallas. She won the 80-meter hurdles, the 8-pound shot-put, the javelin throw, the baseball throw, and tied for first in the high jump with Jean Shiley, representing the Meadowbrook Club of Philadelphia.

The year of 1932 brought to a close an era in United States track and field athletics and started a new one, because in November the Amateur Athletic Union met in New York City and adopted, unanimously, the metric system—discarded the yard and mile, foot and inch as units of measurement in championship competition, and adopted the meter, which is universal throughout the world, except in British domains. The A.A.U. and the Intercollegiate A.A.A.A. made the drastic change to take effect Jan. 1, 1933.

**AUSTIN, LOUIS WINSLOW.** An American physicist, died in Washington, D. C., June 27, 1932. He was born in Orwell, Vt., Oct. 30, 1867, and was graduated from Middlebury College in 1889 and with the Ph.D. degree from the University of Strassburg in 1893. After acting as instructor and assistant professor of physics at the University of Wisconsin he entered the German government service in 1902, being a member of the staff of the Physikalisches-Technische Reichsanstalt in Berlin. In 1904 he returned to the United States and became associated with the Bureau of Standards in Washington. A pioneer in the study of radio science, he was head of the U. S. naval radiotelegraphic laboratory from 1908 to 1923 and during the World War was chief radio expert for the U. S. Navy Department. After 1923 he was chief of the Bureau of Standards' laboratory for special radio transmission research. He was a past president of the Institute of Radio Engineers, vice president and chairman of the American section of the International Union for Scientific Radiotelegraphy, and member of the technical advisory committee of the Conference on the Limitation of Armament held in Washington in 1921. He was also U. S. delegate to the radiotelegraphic conferences held in London (1912) and Paris (1921), the International Research Council in Brussels (1922), and the Pan-Pacific Science Congress in Tokyo (1926). In 1927 he was a member of the International Radio Conference at Washington, and the following year was appointed chairman of the committee of radio investigation of the International Society for the Study of the Arctic Regions by Means of Airships. His researches pertained to measurements of radio signals and atmospheric disturbances, relation between effective resistance and frequency in radiotelegraphic condensers, formulae for antenna capacity and daylight radio transmission across the ocean, and the relation of solar activity to radio phenomena.

In 1927 he was awarded the gold medal of the Institute of Radio Engineers. He was the author, with C. B. Thwing, of *Physical Measurement* (1896) and published a large number of papers in various scientific periodicals.

**AUSTRALIA**, COMMONWEALTH OF. A self-governing dominion of the British Empire, comprising the island continent of Australia. Capital, Canberra.

**AREA AND POPULATION.** With an area of 2,974,581 square miles, Australia had an estimated population on Mar. 31, 1932, of 6,539,270, as compared with 6,488,707 a year earlier. The areas of the six States and two Territories, with respective estimated populations on March 31 in 1931 and 1932, are shown in the accompanying figures of the Commonwealth Statistician.

#### AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in square miles	Population Mar. 31, 1931	Population Mar. 31, 1932
New South Wales ..	809,432	2,504,586	2,526,345
Victoria .....	87,884	1,795,522	1,804,584
Queensland .....	670,500	952,483	965,934
South Australia ..	380,070	582,928	585,466
Western Australia ..	975,920	420,124	421,562
Tasmania .....	26,215	219,694	221,584
Northern Territory	523,620	4,618	4,550
Federal Capital Territory ..	940	8,807	9,245
Total .....	2,974,581	6,488,707	6,539,270

During 1931, births numbered 118,509 (128,399 in 1930), deaths 56,560 (55,331), marriages 38,882 (43,255). The excess of births over deaths for the year totaled 61,949, as against 73,068 in 1930, while the excess of emigration over immigration was 12,061 (11,408 in 1930). Thus the total estimated population increase for 1931 was but 49,888, compared with 61,660 in 1930 and 124,340 in 1927. Persons arriving were exceeded by departures in 1930 and 1931 for the first time since the period 1901-05. The estimated populations of the State capitals on Jan. 1, 1932, with figures for Jan. 1, 1931, in parentheses, were: Sydney, New South Wales, 1,256,230 (1,253,560); Melbourne, Victoria, 1,030,750 (1,014,600); Brisbane, Queensland, 317,150 (313,251); Adelaide, South Australia, 324,337 (324,420); Perth, Western Australia, 211,840 (204,780); Hobart, Tasmania, 57,800 (57,800). The population of Canberra, the Federal capital, on June 30, 1931, was 7047. These seven cities contained nearly half of the total inhabitants.

**EDUCATION.** Primary education is free and compulsory and State aid is extended to the higher State schools, secondary schools, and the universities. In 1930, there were 10,263 State schools, with 929,299 pupils enrolled; 1806 private schools, with 242,077 pupils; and six State universities—one at each State capital—with 8497 students. For education in the States and Territories, consult the individual articles.

**PRODUCTION.** Australia is primarily an agricultural and pastoral country, although extensive manufacturing has developed in the centres of population. The estimated value of production by principal industries for fiscal years ending June 30 is shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

#### VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED JUNE 30

[In thousands of pounds sterling]

Item	1929	1930	1931
Agricultural .....	£ 89,440	£ 77,109	£ 70,500
Pastoral .....	116,738	84,563	69,499
Dairy, poultry, bee-farming .....	50,717	49,898	48,067
Forestry and fisheries ..	11,617	11,871	8,318
Mining .....	19,537	17,912	15,856
Manufacturing * .....	159,759	149,184	112,966
Total .....	447,805	389,537	319,701

\* Value added in process of manufacture.

In 1929, Australia reported about 29,280,000 acres of arable land, or about 2 per cent of the total area, 5,033,000 acres of permanent meadow and pasture, and 394,000 acres of trees, shrubs, and bushes. Wheat and wool are the leading agricultural products. The final estimate for the 1931-32 wheat crop was 189,652,654 bushels from 14,724,830 acres, as compared with the record crop of 213,594,391 bushels from 18,164,920 acres in the previous year. Production of other leading crops in 1931-32 was: Oats, 16,150,759 bushels; corn, 7,929,000 bushels; hay, 3,374,496 tons; sugar cane, 4,194,509 tons; cane sugar, 600,117 tons (estimated). The total acreage under all crops in 1930-31 was 25,163,816 (21,380,600 in 1931-32). With the exception of sugar cane all principal crops were larger in 1930-31 than in the previous year. Apple production in 1930-31 was estimated at nearly 6,500,000 bushels. Other fruits, wine, and vegetables are extensively produced.

The wool clip for the season ended June 30, 1931, totaled 912,141,253 pounds, as in the grease, against 937,596,816 pounds in 1929-30. The 1931-32 estimate was 950,000,000 pounds. Livestock in 1930 included 110,568,279 sheep, 11,719,084 cattle, 1,792,734 horses, and 1,071,679 swine. Australia occupied first rank among sheep-raising countries of the world. In 1930-31, production of butter totaled 351,369,518 pounds; cheese, 33,099,781 pounds; bacon and ham, 71,050,133 pounds.

The value of mineral output in the calendar year 1930 was as follows: Gold, £1,981,971 (£3,563,499 in 1931); silver and lead, £2,243,313; copper, £810,057; tin, £218,053; coal, £7,632,311; all minerals, £15,400,334 (£17,911,823 in 1929). Manufacturing production during 1930-31 was carried on in 21,751 establishments, employing 338,113 workers and paying salaries and wages of £62,454,859. The total value of the manufacturing output, including the cost of materials used, declined to £290,798,564 in 1930-31 from £420,445,288 in 1928-29 as a result of the economic depression. The leading manufactured products are food and drink, metal products and machinery, clothing and textile fabrics, books and paper, heat and power, and wood, stone, clay and glass products. Statistics of production, etc., for the several States are given in the article on each State.

**COMMERCE.** While imports into Australia declined by almost one-third in the 1931-32 fiscal year, as compared with 1930-31, exports remained on virtually the same level, with a resulting large favorable balance of trade. Imports, in British currency, were valued at £44,729,825, compared with £60,959,633 in 1930-31 and £131,081,320 in 1929-30. Exports, in estimated British currency values, were: 1931-32, £84,922,884; 1930-31, £88,904,142; 1929-30,

£125,127,148. In Australian currency, which was heavily depreciated with relation to the pound sterling, the figures for exports were: 1931-32, £107,885,791; 1930-31, £104,354,638; 1929-30, £125,127,148.

Values of the leading exports in 1931-32, in Australian currency, with 1930-31 figures in parentheses, were: Wool, £32,086,820 (£32,001,760); wheat, £19,208,618 (£14,744,468); butter, £9,812,827 (£8,120,165); flour, £3,833,244 (£3,513,573); mutton and lamb, £2,994,062 (£2,105,963); beef, £2,087,829 (£2,235,526). The chief imports, in order of value, were apparel, textiles, and manufactured fibres; metals, metal manufactures, and machinery; oils, fats and waxes; paper and stationery; drugs, chemicals and fertilizers; foodstuffs and beverages.

In 1930-31, the United Kingdom supplied 39.6 per cent of the total imports and took 44.04 per cent of the exports; the United States supplied 19.39 per cent and took 3.26 per cent; the British Empire, 54.04 and 55.04, respectively.

FINANCE. In his budget speech before the House of Representatives Sept. 1, 1932, Prime Minister and Treasurer Joseph A. Lyons announced that the Commonwealth account for the fiscal year ended June 30, 1932, closed with a surplus of £1,314,000, with revenue totaling £71,532,000 and expenditure £70,218,000. The result showed an improvement of £2,462,000 on the budget forecast, which anticipated a deficit of £1,148,000. This compared with a deficit of £10,757,619 in the 1930-31 fiscal year, when receipts totaled £69,566,919 and expenditures £80,324,538, and with a deficit of £1,471,003 in 1929-30, when revenue amounted to £77,143,390 and expenditures to £78,614,393.

Mr. Lyons estimated revenue and expenditure for 1932-33 at £65,986,000 and £68,767,000 respectively, leaving a gap of £2,781,000, which the Government proposed to bridge by carrying forward the surplus from 1931-32 and a further reduction of £1,479,000 in expenditure, leaving an anticipated surplus of £12,000. (For details of the 1932-33 economies, see under *History*.) The aggregate debt of the Commonwealth and of the six States on June 30, 1932, amounted to £1,187,827,868, an increase of £31,792,951 during the 1931-32 fiscal year. Sinking-fund payments of the Commonwealth and the States during 1931-32 totaled £7,200,000; for 1932-33 they were estimated at £7,275,000. Of the total indebtedness, £398,884,730 represented that of the Commonwealth and £788,943,138 that of the States, as compared with £388,718,138 and £767,317,545, respectively, on June 30, 1931. A five-year  $3\frac{1}{2}$  per cent £12,360,000 Commonwealth loan was floated in London in October, 1932. For state finances, see article on each State.

COMMUNICATIONS. Federal and state railway lines in operation in 1930-31 aggregated 26,809 miles, divided as follows: Federal, 2145; New South Wales, 6044; Victoria, 4717; Queensland, 6529; South Australia, 2529; Western Australia, 4180; and Tasmania, 665. There were in addition about 872 miles of private line open for general traffic. Gross revenues of the Commonwealth and state lines for 1930-31 aggregated £38,985,000; operating expenses totaled £31,728,000 and the net earnings £7,257,000. The Federal, South Australia, and Tasmania railways had operating deficits of £150,000, £148,000, and £49,000, respectively. The other state systems reported net earnings of: New South Wales, £3,106,-

000; Victoria, £2,508,000; Queensland, £1,402,000; Western Australia, £588,000. The above figures exclude interest payments on railway loan funds. Including interest charges, all systems reported deficits for 1930-31 as follows: Federal, £641,291; Victoria, £1,478,564; Queensland, £1,619,165; Western Australia, £379,992; Tasmania, £334,543; South Australia, £1,685,920; New South Wales, £4,421,620 (£4,555,000 in 1931-32).

Operating revenues and expenditures of the various railway systems was reported as follows for 1931-32: Federal—revenues £281,000, expenditures £358,000; Victoria—revenues £9,454,000, expenditures £6,181,000; Queensland—£5,995,000 and £4,429,000, respectively; South Australia—£2,757,000 and £2,145,000; Western Australia—£2,922,000 and £2,123,000; Tasmania—£379,000 and £387,000.

Highways in 1930 extended 329,660 miles, of which about 6500 miles were macadam. An outstanding aid to Australian communication was the formal opening on Mar. 19, 1932, of the great bridge over Sydney harbor. An air-mail line between London and Australia was inaugurated in 1931. Statistics of civil aviation for the year were as follows for the year ended June 30, 1932: Registered aircraft, 189; number of hours flown, 31,493 (44,507 in 1930-31); passengers carried, 69,795 (94,350 in 1930-31); goods carried, 221,552 pounds (204,445).

GOVERNMENT. The executive power is vested in the King, who acts through a governor-general, assisted by an executive council of responsible ministers, who must be members of the Federal Parliament, comprising the Senate and House of Representatives. The Senate consists of at least six members from each of the original States, elected for six years, half of whom are renewed every three years; while the House of Representatives consists of approximately twice as many members as there are senators, the representation being apportioned among the several States according to the population shown at the last census. The number in the House in 1932 was 75 and in the Senate, 36. The composition of the House following the election of Dec. 19, 1931, was: United Australia party, 39; Country party, 16; Labor (Federal group), 14; Labor (Lang group), 4; Independent, 2. The Senate was composed as follows: United Australia party, 24; Labor (Federal group), 6; Labor (Lang group), 2; Country party, 4. The Governor-General in 1932 was Sir Isaac Alfred Isaacs, a native Australian who assumed office Jan. 22, 1931. The Cabinet formed by the United Australia party on Dec. 31, 1931, with the support of the Country party, was as follows: Prime Minister and Treasurer, Joseph A. Lyons; Assistant Treasurer, Stanley M. Bruce; Vice-President of the Executive Council, A. J. McLachlan; Attorney-General, Minister for External Affairs and Industry, J. G. Latham; Defense, Sir George F. Pearce; Trade and Customs, H. S. Gullett; Home Affairs and Transport, R. Archdale Parkhill; Markets, C. A. S. Hawker; Health, Repatriation and Works, C. W. C. Marr; Postmaster-General, J. E. Fenton.

#### HISTORY

Political developments during 1932 revolved turbulently about the economic issues raised by the world depression and its acute repercussions in Australia. The year was marked by the final

triumph of the forces favoring financial retrenchment and full payment of all governmental obligations abroad. It brought decisive defeat to J. T. Lang, Labor Premier of New South Wales, and the supporters of his policies of debt repudiation, currency inflation, unification of the State governments, and militant socialism. Under Prime Minister Lyons Australia's precarious condition showed steady improvement. The budget was balanced, the trade balance became favorable through the drastic reduction of imports, foreign obligations were met or refunded, and Australian securities regained much of their depreciated value on the world money markets.

Prime Minister Lyons and his newly formed United Australia party had been swept into power in the General Election of Dec. 19, 1931, on a programme of debt repayment, a balanced budget, and inter-imperial coöperation regarding tariff preferences, markets, and a sounder monetary system. His triumph was ascribed primarily to the general fear of "Langism" and secondarily to the inflationary financial policy of the Scullin-Theodore faction of the Federal Labor party, then in power. The Scullin Ministry, moreover, had made no effective attack upon the unemployment problem.

**REVISION OF TARIFF.** The Country party, headed by Dr. Earle Page, had united with the United Australia party to overthrow the Labor government. Standing for lower tariffs, decentralization, and the interests of farmers and primary producers, the party demanded the Customs portfolio in the Lyons Ministry in order to guide the new government's tariff policies. Mr. Lyons refused the demand, thus alienating the unqualified support of the Country people. He nevertheless retained an absolute majority in the Federal Parliament. Despite this development, the new tariff schedule enacted by Parliament in February went a long way toward meeting the wishes of the Country party. It involved 11 increases in Customs duty and 69 reductions, besides two increases in Excise and four reductions. The schedule further repealed 19 of the 74 special duties and 43 of the 78 prohibitions enacted when the Labor party embarked on its policy of a high protective tariff in 1930. These and subsequent reductions, made in accordance with recommendations of the Tariff Commission, were regarded as steps toward a restoration of the lower duties in force previous to the formation of the Scullin government. The lower duties increased the preference given to British goods.

**THE CONFLICT WITH LANG.** Besides its tariff legislation the government in February enacted a measure to force Premier Lang of New South Wales to meet that State's debt. This move was precipitated by the repetition on February 1 of numerous previous defaults on interest and amortization payments due on the State's indebtedness. The Federal Government was again forced to assume the obligation in order to protect the credit of the Commonwealth and the other five States. To end this state of affairs, a law was passed March 11 authorizing the Commonwealth to garnishee the revenue of any State which defaulted in interest payments on its debts. The operation of this drastic measure was limited to two years. It was opposed in principle by the Tasmanian Assembly as well as by the New South Wales authorities.

Premier Lang immediately contested the con-

stitutionality of the law before the Australian High Court, which on April 6 upheld its validity. On April 23, the High Court refused Lang's application for permission to appeal the case to the Judicial Committee of the Privy Council. Meanwhile the Commonwealth had proceeded to apply the law. It issued proclamations (April 7 and 11) attaching taxes on betting and racing profits, on State lotteries, entertainments, motor vehicles, and levies for unemployment relief. It also ordered New South Wales taxpayers to pay their taxes to the Commonwealth Bank, instead of to the State collector of taxes.

Lang countered by closing the taxation offices and withholding their records from the Commonwealth. He withdrew from the banks some £1,000,000 in small notes and placed them in the State Treasury building to prevent their attachment. Following a further default of £200,000 on May 1, the Federal Parliament empowered the government to impose a £1000 fine or three years' imprisonment upon any State official who obstructed the transference of revenues or tax documents. By May 4, the Federal authorities had succeeded in collecting only £440,000 of the amount in default by New South Wales, leaving £2,760,000 outstanding.

The bitterness aroused by these events was evidenced by the growth of the so-called New Guard, a Fascist organization formed a year earlier in Sydney to oppose Premier Lang, to a membership of 100,000. The Lang adherents responded by organizing on April 15 a "Red Army" of 25,000 war veterans. Civil war seemed imminent, and the Commonwealth government started enrolling special constables to protect its property in New South Wales. At this juncture, Premier Lang played into the hands of his opponents by issuing an order forbidding his department heads to pay funds into the Commonwealth Bank under the Federal enforcement act. Sir Philip Game, the British Governor of the State, immediately dismissed Mr. Lang from office (May 13) on the ground that the order was unconstitutional. B. S. B. Stevens, leader of the Opposition and a member of the United Australia party, was commissioned to form a new government. New elections were set for June 12.

When Lang left office, the total defaults made under his régime amounted to £4,000,000, of which £3,200,000 represented overseas interest and £800,000 internal interest. The first official act of Premier Stevens was to pay £300,000 of this indebtedness and to announce his support of the so-called Premiers' or Copland plan for Australian financial rehabilitation (see 1931 YEAR BOOK). With this change in policy, New South Wales secured the aid of the Commonwealth Loan Council in meeting its debts, including £2,000,000 of State obligations due in London July 1.

The political campaign in New South Wales was fought out with extreme bitterness, with the attention of the entire Commonwealth focused upon the outcome. Premier Stevens declared that the return of Mr. Lang would mean civil war and the breakup of the Federal union. The voting gave Lang's opponents a three-to-one majority in the State Assembly, the United Australia party, combined with the Country party, securing 66 seats to Labor's 24. The previous standing of the parties was: Labor, 55; United Australia party, 23; Country party, 12. Lang was returned from his election district,

but five members of his former cabinet were defeated. Meanwhile the Judicial Committee of the Privy Council in London had dealt Lang's policies another blow on May 31 by dismissing his appeal from decisions of the Australian courts, which had declared unconstitutional his bill to abolish the Legislative Council in New South Wales. It was held that the abolition of the State's upper chamber could be determined only by referendum.

**OTHER STATE ELECTIONS.** The overturn in New South Wales was preceded by the ousting of the Labor party from control in Victoria in the State election of May 14. While Premier E. J. Hogan was recuperating from illness in London, Acting Premier Tunnecliffe, supported by extremist Laborites, espoused Premier Lang's policy of debt repudiation for Victoria. The result was the passage of a non-confidence motion in the Victorian Assembly on April 13 by a vote of 29 to 25. In the subsequent election the United Australia party won 33 seats against 18 in the previous Parliament, while the Official Labor party's standing was cut to 15 from 30 seats. The Country party won 14 seats, the same as before, the Hogan Laborites 2, and the Independents 1 in place of 3. The Labor government resigned on May 18 and a United Australia ministry was formed under Sir Stanley Argyle, leader of the party.

In Queensland, the situation was reversed in the State election of June 12, when the Labor party headed by Forgan Smith overturned the Nationalist-Country Progressive government of Premier A. E. Moore. At dissolution, the standing of the parties was: Nationalists and Country Progressives, 41; Labor, 26; Country party, 3; Independents, 2. The lineup after the elections was: Labor, 33; Nationalists and Country Progressives, 28; Independents, 1. The number of seats in the Legislature was cut from 72 to 62 by a new redistribution bill. The new Premier, Forgan Smith, stood for more conservative policies than the Labor leaders in New South Wales and Victoria.

**THE FINANCIAL PROBLEM.** With the chief political obstacles to financial reconstruction thus removed, the Lyons government called a conference of the State Premiers at Melbourne in July to tackle the problem of reducing unemployment. A similar effort in April had been frustrated by the opposition of Premier Lang and Acting Premier Tunnecliffe of Victoria. The July conference was informed by Premier Stevens of New South Wales that the deficit of his State for the fiscal year ended June 30, 1932, amounted to £14,228,000 and that an investigation had revealed overdrafts on various accounts amounting to £40,000,000.

Premiers Stevens and Forgan Smith pledged their respective States to support the 1931 Premiers' Plan. In extending the plan to the 1932-33 fiscal year, the Premiers agreed to restrict the deficit on the combined State and Federal budgets to the equivalent of \$45,000,000. On this condition, the Commonwealth Bank and various private banks agreed to advance the several governments \$30,000,000 for public works and \$35,000,000 as a revival loan. With these funds the governments commenced large public works and other projects calculated to stimulate the revival of business. Some improvement was noted as a result of this effort, but complete re-

covery hinged on the increase of world prices for primary produce.

The financial programme of the Federal Government was set forth by Prime Minister Lyons on September 1 (see under *Finance*). Reporting a surplus for 1931-32, he announced plans for balancing the 1932-33 budget, without resort to additional taxation. A large list of items used by farming, pastoral, dairying, and mining industries were exempted from primage duties and sales taxes. All the quotas and prohibitions established by the Scullin government to rectify the trade balance were removed. Important reductions were made in the customs tariff, the bounty on gold production was suspended as from September 13, invalid and old-age pensions were reduced from 17 shillings sixpence to 15 shillings per week, and salaries of Cabinet Ministers, members of Parliament, and public employees were further reduced. The budget made no provision for the resumption of interest payments on the war debt to the British Government, which were postponed by agreement in 1931. In order to arrange for the postponement or refunding of the various State and Federal loans falling due in London, Prime Minister Lyons sent former Prime Minister Stanley Bruce to the British capital as "Minister representing the Commonwealth." Minister of Markets Hawker resigned from the Cabinet September 22 on the ground that his election pledges demanded more than the 25 per cent reduction already effected in Parliamentary salaries.

**EXTERNAL RELATIONS.** At the Ottawa Conference (see CANADA under *History*) the delegates of Australia, headed by Stanley M. Bruce and H. S. Gullett, sought tariff concessions for Australian meat, eggs, and dairy products in Great Britain. No effort was made to secure preferences on the Commonwealth's chief products, wheat and wool, since it was realized that the exportable surplus of these products raised within the Empire made such preferences virtually worthless. The trade agreement finally signed with Great Britain became provisionally effective on Oct. 14, 1932, and was ratified by Parliament November 16. It provided for changes in 200 out of the 343 items in the Australian tariff, designed to increase the margin of preference enjoyed by products of the United Kingdom in the Australian market. These preferences were extended chiefly to British iron and steel products (including machinery, metal manufactures, and electrical goods), chemicals, textiles, leather, rubber, and paper goods, and vehicle parts. Australia promised that it would afford tariff protection "only to those industries which are reasonably assured of sound opportunities for success." Any tariffs imposed, except on behalf of infant industries, were to be low enough to grant British producers "full opportunity of reasonable competition," and British manufacturers were authorized to appear before the Australian Tariff Board. In return, Australia received preferences for its primary products in the British market. The treaty aroused vigorous protests from the protectionist elements in the Commonwealth and led to the resignation of Postmaster-General Fenton on October 5.

**OTHER DEVELOPMENTS.** In accordance with the Northern Territory (Administration) Act of 1931 the correct designation of the Territory of North Australia became "The Northern Territory of Australia." See NORTHERN TERRITORY

OF AUSTRALIA. A rich gold discovery in the great central desert of Australia in 1932 attracted hundreds of prospectors and miners.

**AUSTRIA.** A federated republic of Central Europe proclaimed Nov. 12, 1918, and consisting of the nine provinces of Vienna (City of), Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna (Wien).

**AREA AND POPULATION.** At the census of 1923 the area was 32,369 square miles and the population, 6,534,481, as compared with an area of 39,017 square miles and a population of 7,529,935 in 1910. The estimated population Jan. 1, 1931, was 6,722,395. At the 1923 census the City of Vienna had 1,865,780 inhabitants, or 28.55 per cent of the total population; in 1930, the estimated population of the city was 1,842,763. Other chief cities, with their populations in 1923, are: Graz, 152,706; Linz, 102,081; Innsbruck, 56,401; and Salzburg, 37,856. For 1930, births numbered 112,601 (10.8 per 1000 of population), deaths 90,512 (13.5 per 1000), marriages 51,700, divorces 6593. Emigrants in the same year totaled 4181 (4850 in 1929), of whom 1257 went to the United States and 1021 to Argentina.

**EDUCATION.** Elementary education is compulsory for children between the ages of 6 to 14 years, although many exemptions are granted children over 12. Public and private elementary schools in 1929-30 numbered 5325, with 30,317 teachers and 792,623 pupils. There were 157 secondary schools of all kinds, with 51,982 pupils, eight commercial academies with 4278 students, and three state universities at Vienna (11,337 students in 1929-30), Graz (2154 students), and Innsbruck (2041 students).

**PRODUCTION.** Agriculture is the chief occupation, but manufacturing, lumbering, and mining are important industries. In 1930, Austria had 4,754,000 acres of arable land (23 per cent of the total area); 5,709,000 acres of permanent meadow and pasture; 304,000 acres of trees, shrubs, and bushes; and 7,751,000 acres of woods and forests. Production of the chief crops, in bushels, in 1931, with 1930 figures in parentheses, was: Wheat, 11,009,000 (12,008,000); rye, 18,932,000 (20,636,000); barley, 9,948,000 (12,278,000); oats, 22,879,000 (27,606,000); corn, 4,991,000 (4,756,000); potatoes, 99,618,000 (97,482,000). Sugar beet production was 978,000 metric tons (973,000 in 1930); beet sugar, 165,000 metric tons in 1931-32 (150,000 in 1930-31); wine, 35,505,000 gallons (31,764,000); flax, 10,689,000 pounds (12,694,000); fodder roots, 2,203,000 metric tons (2,347,000). Livestock on farms in 1930 included 2,313,000 cattle, 272,000 sheep, 1,965,000 swine, and 248,000 horses.

Austrian industries were severely depressed during 1930 and 1931 (see *History*). There was a 22 per cent increase in the number of workers receiving unemployment relief during 1931, the total on December 31 being 329,627 (294,845 on Dec. 31, 1930). Early in 1932 the number increased to 362,000 and then declined to 265,000 on June 30. Mineral and manufacturing production in 1931, with 1930 figures in parentheses, was (in metric tons): Coal, 228,000 (216,000); lignite, 2,982,000 (3,063,000); iron ore, 512,000 (1,178,000); magnesite (sintered), 48,799 (124,226); crude steel, 322,357 (467,701); pig iron, 145,087 (287,001); copper, 3255 (3654); lead (smelter), 6117 (6923); wood pulp, 96,080 (103,470); cellulose, 210,060 (213,460); paper, 215,

580 (210,260); cardboard, 29,680 (58,020); cotton yarn, 39,000 (43,550).

**COMMERCE.** Austrian foreign trade in 1931 continued the sharp decline manifested in the previous year. Imports fell to 2,208,200,000 schillings (2,738,900,000 in 1930) and exports to 1,340,500,000 schillings (1,879,600,000 in 1930). The schilling exchanged at \$0.1402 in 1931; par equals \$0.1407. Imports in schillings consisted of: Manufactures, 857,500,000; foodstuffs, 507,500,000; raw material and semi-manufactures, 450,000,000; mineral fuel, 177,100,000; livestock, 168,000,000. The division of exports in schillings was: Manufactures, 980,200,000; raw materials and semi-manufactures, 269,000,000; foodstuffs, 37,000,000. The chief sources of imports, in order of importance, were Germany, Czechoslovakia, Hungary, Poland, Yugoslavia, and the United States. Exports went to Germany, Czechoslovakia, Italy, Yugoslavia, Hungary, and Switzerland in the order named.

**FINANCE.** As passed by the Legislative Assembly, the Austrian budget for the 1931 fiscal calendar year anticipated revenues of 2,172,492,000 schillings and expenditures of 2,408,437,000 schillings, the expected deficit being 235,945,000 schillings. Closed accounts showed revenues of 2,009,000,000 schillings and expenditures of 2,330,000,000 schillings, leaving a deficit of 322,000,000 schillings. The amended budget estimates for 1932 balanced at 1,964,000,000 schillings, but indications were that revenues would be about 70,000,000 schillings less and expenditure about 20,000,000 schillings more. The budget estimates were balanced by omitting liabilities arising from the Creditanstalt difficulties and transferring obligations amounting to 43,000,000 schillings to the 1933 budget. The 1933 budget estimates placed net expenditures at 1,324,071,000 and net revenues at 1,324,299,000 schillings.

The public debt on Jan. 1, 1931, totaled 2,397,900,000 schillings (about \$377,384,000). In 1932 external service on the national debt required 140,000,000 schillings for interest and sinking fund; on debts of provinces and communes, 38,000,000; bank debts, excluding the Government-guaranteed Creditanstalt, 9,000,000; and industrial debts, 25,000,000. These aggregated 212,000,000 schillings (about \$29,600,000). Austria suspended service on its foreign debt in foreign currencies on June 22, 1932 (see *History*). The foreign public debt in 1932 was \$237,400,000 and the private foreign debt was \$228,400,000.

**COMMUNICATIONS.** Austria in 1931 had 4154 miles of railway lines, of which 3609 miles were state and private lines operated by the state and 545 miles were privately owned and operated. Nearly 500 miles were electrified. Highway mileage in 1931 aggregated 21,273 miles, of which 2450 miles were national roads. Work on the important Grossglockner Alpine Highway, to furnish direct connection between Bavaria and Salzburg on the north and Carinthia and Italian points on the south, was continued during 1932 and 9.3 miles of the road were opened to traffic early in the year. The state-subsidized Austrian Air Transport Company maintained regular air services. Various air lines linked Vienna with other European capitals.

The Federal Railways reported an actual deficit of 83,071,000 schillings in 1931, and estimated deficits of 105,000,000 and 59,400,000 schillings, respectively, for 1932 and 1933.

**GOVERNMENT.** Under the Constitution adopted

Oct. 1, 1920, and amended Dec. 7, 1929, executive power is vested in a president, elected for four years, who appoints the Ministry and has power to dissolve Parliament. Legislative power rests with an assembly (Nationalrat), elected by popular vote for four years, and a first chamber (Bundesrat), chosen by the Provincial Diets in proportion to the population of the respective Provinces. The composition of the Nationalrat following the election of Nov. 9, 1930, was: Social Democrats, 72; Christian Socialists, 66; National Economic party (including 8 Pan-Germans), 10; Agrarian League, 9; Heimwehr, 8. President of the Republic, Dr. Wilhelm Miklas, reelected Oct. 9, 1931. The Ministry constituted June 20, 1931, represented a coalition of the Christian Socialist, Agrarian League and National Economic parties. It included: Chancellor, Dr. Karl Buresch (Christian Socialist); Foreign Minister, Dr. Johann Schober; Interior and Vice Chancellor, Franz Winkler; Social Welfare, Dr. Josef Resch; Justice, Hans Schuerff; Army, Karl Vaugin; Trade, Edward Heini; Agriculture, Engelbert Dollfuss; and Finance, Dr. Joseph Redlich. Dr. Redlich resigned Oct. 5, 1931, and was succeeded by Dr. E. Weidenhöffer. For changes in 1932, see *History*.

#### HISTORY

Throughout 1932 the Austrian Government struggled desperately, but largely in vain, to check the financial and economic collapse precipitated by the failure of the Creditanstalt in May of the preceding year (see 1931 YEAR BOOK). At the beginning of the year, Austria stood practically isolated economically as a result of the 1931 crisis in Central Europe. Due to higher tariffs and restrictions placed on foreign exchange transactions and the export of precious metals, Austria's principal industries, steel, and textiles, were suffering from a shortage of imported raw materials. Austrian exports were similarly excluded from neighboring markets, resulting in unemployment and stagnation of trade and industry. The Government was confronted with a large deficit in the 1931 budget and with similar financial prospects for 1932 (see *Finance*). The financial drain necessary to maintain the Creditanstalt threatened to bankrupt the Government, not to speak of the repayment due January 16 of the \$14,000,000 British loan of 1931 and the possibility of withdrawal of the large short-term credits in Austria unless the Government continued its guarantee of the Creditanstalt's liabilities, reported to total \$200,000,000.

To offset tariff and exchange restrictions, the Government sought to conclude clearing arrangements with neighboring countries, principally by eliminating actual transfers of foreign currency through a balancing of mutual claims. Agreements along this line with Switzerland, Hungary, and Italy went into effect in December, 1931, or in January, 1932. The arrangements were tentative and encountered many financial and technical obstacles. Negotiations with Poland, Czechoslovakia, Germany, and Yugoslavia looking toward similar agreements proved unsuccessful. Another extension was secured on the British loan, but the promised French credit of \$8,500,000 failed to materialize although Austria had complied with the recommendations of the League of Nations Financial Committee for in-

creasing taxes, reducing expenditures, and reorganizing the Federal railways.

**CABINET REORGANIZATION.** The delay in securing the French loan was attributed to French antagonism to Foreign Minister Schober for his part in the Austro-German customs union project of 1931. The Cabinet accordingly resigned on January 27 and a new ministry was formed two days later by Chancellor Buresch from which Dr. Schober was eliminated. Besides Dr. Buresch as Chancellor and Minister of Foreign Affairs, the new Ministry included: Vice Chancellor, Franz Winkler; Defense, Karl Vaugin; Justice, Dr. Schuschnigg; Agriculture and Forestry, Dr. Engelbert Dollfuss; Finance, Dr. Otto Juch; Commerce and Communications, Dr. Eduard Heindl; Education, Dr. Emmerich Czermak; Interior, Herr Hantsch. With the exception of Winkler, leader of the Agrarian League, the new Cabinet was formed almost entirely of Christian Socialists, or Clericals. It lacked a majority in Parliament. A few days later (February 4) when the gold and foreign exchange coverage of the paper currency fell below the legal minimum of 24 per cent the Government accepted the resignation of Dr. Richard Reich, president of the Austrian National Bank. Dr. Victor Kienboeck, former Minister of Finance and the right-hand man of former Chancellor Seipel, was appointed to the post.

**AUSTRIA AND DANUBIAN UNION.** The presence in Austria of a government dominated by Clericals opposed to Austro-German union encouraged Premier Tardieu of France to formulate his proposal of March 1 for a union of the Danubian states based on a system of preferential tariff agreements and import quotas (see UNITED STATES OF EUROPE). On February 16 a plea for economic coöperation had been made by Dr. Buresch. The proposal to include Austria, Hungary, Czechoslovakia, Rumania, and Yugoslavia within a customs union was favorably received in Vienna clerical circles, which still dreamed of a great Catholic monarchy to include substantially those territories. Austrian industrialists, however, feared the competition of Czech industry under a Danubian preferential agreement. The strong Pan-German element in Austria bitterly attacked the proposal as a scheme to detach Austria and Hungary from Germany and to bring them under French financial control.

The Tardieu plan was frustrated by the opposition of Germany and Italy and heavy gains made by the Hitlerites (National Socialists) in the Austrian provincial elections of April 24, which further weakened the Buresch government, ended any hope that Austria would collaborate in a Danubian union under French auspices. The Hitlerites were previously a negligible quantity in Austria. In the April balloting, however, they cast nearly 16 per cent of the total vote in Vienna Province, 18 per cent in Lower Austria and 22 per cent in Salzburg, their gains being chiefly at the expense of the Pan-German, Agrarian, and Christian Socialist parties. The new Vienna Diet consisted of 66 Socialists, 19 Clericals, and 15 Hitlerites. The rise of the Hitler adherents, who naturally favored close coöperation with Germany, coincided also with the virtual elimination of their Fascist predecessors, the Austrian Heimwehr (see 1931 and previous YEAR BOOKS). Later friction developed between the Austrian and German Hitlerites and on December 24, Dr.

Walter Pfrimer, leader of the Austrian National Socialists, withdrew the command of his organization from Hitler.

**DOLLFUSS BECOMES CHANCELLOR.** Impotent for lack of a majority, the Buresch government was forced to resign on May 6. Two weeks of political negotiation followed before a new ministry was constituted with Dr. Engelbert Dollfuss, a Christian Socialist who had served as Minister of Agriculture in the three preceding cabinets, as Chancellor. The new ministry represented a coalition of the Right parties, including representatives of the Christian Socialists, Agrarians, and the Heimwehr. Other members were: Vice-chancellor, Franz Winkler; Interior, Franz Bachinger; Justice, Dr. Kurt Schuschnigg; Finance, Dr. E. Weidenhoffer; Social Welfare, Dr. Josef Resch; Trade and Transport, Dr. G. Jaconcic; Defense, Karl Vaugoin; Safety, Dr. Hermann Ach; Education, Dr. Anton Rintelen.

The chief issue confronting the Dollfuss government was the consummation of a loan under the auspices of the League of Nations in order to avert still greater collapse. Protracted negotiations were held with representatives of the League and with representatives of British and American banks which had advanced \$70,000,000 in short-term credits to the tottering Creditanstalt. On June 13, the banking representatives left Vienna without having reached an agreement to stabilize the situation. They rejected various Government proposals, including the taking over by the foreign creditors, in lieu of \$25,000,000 of their claims, of oil and sugar refineries and other factories listed among the assets of the Creditanstalt. Continuation of the unfavorable trade balance, inability to raise a loan, and exchange transfer difficulties forced the Government on June 22 to suspend the service on the Austrian foreign debt in foreign currency, schillings being offered instead. On July 1, the Government defaulted for the first time on the monthly installments due on the \$126,000,000 League of Nations loan of 1923. The League trustees for the loan responded by refusing to turn over to the Austrian Government the income from the customs and tobacco monopoly pledged for the loan, although this totaled \$6,000,000 monthly as against the \$1,500,000 required to service the loan.

Aroused by these developments, the Council of the League on July 15 approved a guaranteed 20-year international loan to Austria. France and Great Britain contributed \$14,000,000 each, the balance being furnished by Italy, Spain, Holland, Belgium, Switzerland, and Czechoslovakia. Conditions attached to the loan were more severe than those of the 1922 Reconstruction Loan. Austria was to pledge herself not to seek close economic coöperation with any single country for the duration of the loan, a provision designed to bar economic or political union with Germany. Provincial and municipal budgets were to be balanced, the State Railway administration was to be reformed, and no individuals or private firms were to be allowed to incur foreign debts of more than \$140,000 without the permission of the Austrian National Bank.

The loan conditions aroused a storm of protest in Austria, where they were denounced as a new form of servitude. Grim necessity forced the Dollfuss Cabinet to present the protocol to Parliament for ratification, although the Cabinet's fate hung upon the outcome of the vote. The

measure was adopted by the lower house of Parliament August 17 by a vote of 81 to 80, but only after the Government had mustered every available ballot by bringing ailing deputies to the chamber in ambulances and otherwise.

The necessary authorization for the advance of the British and French shares of the loan was given by the British House of Commons on December 20 and by the French parliament on December 30. Meanwhile further hope of assistance was held out by a special committee appointed by the Lausanne conference on July 9, which met at Stresa, Italy, September 5-20. It was authorized to consider measures for eliminating the transfer difficulties in Central and Eastern Europe, reviving trade in that region, and alleviating the critical condition of the agrarian countries. However, the Stresa Conference devoted most of its time to the consideration of preferences for agricultural products. It postponed to a later date consideration of "the particularly important problem of Austria."

Some tangible relief was forthcoming at the end of November when an agreement for the reorganization of the Creditanstalt was reached with the creditors of the bank through the international creditors' committee in London. In place of their claims aggregating about \$100,000,000, including about \$20,000,000 held by some 30 American banks, the creditors agreed to accept seven yearly payments of nearly \$3,000,000 each. On December 1, it was announced that trustees of the Austrian government guaranteed loan of 1923-24 had postponed the payment of \$287,556 due to the United States government Jan. 1, 1933, as well as payments due to the other nations which participated in the loan. On October 20, new exchange regulations were issued by the Austrian National Bank. These enabled foreign owners of schilling deposits in Austria to sell such deposits to third parties in a lawful way. They also made it possible to transfer schillings out of Austria through private clearing arrangements, which would involve a loss of about 20 per cent. Another step taken by the Dollfuss government was the adoption of a new *modus vivendi* with Rumania, effective October 22, prolonging the most-favored-nation commercial treaty and providing for further duty concessions by Rumania.

Mgr. Ignaz Seipel, who as Chancellor from 1922 to 1929 rescued Austria from threatened postwar collapse, and Dr. Johann Schober, who served twice as Chancellor, died on August 2 and 19, respectively. See biographies of each.

Consult "Austria: The Paralysis of a Nation," *Foreign Policy Reports*, Jan. 4, 1933, vol. viii, no. 22; and Victor W. Germain, *Austria of Today* (London, 1932).

**AUTHORS' LEAGUE OF AMERICA.** A national organization of authors, dramatists, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The league supplies to its members confidential information relating to publishers, theatrical and motion-picture producers, and other persons and companies engaged in the purchase, sale, pub-

lication, or production of copyrightable material. The league includes the dramatists' guild, the authors' guild, and the screen writers' guild. Closely affiliated with it is the Authors' League fund, an agency formed by the league to meet its obligations with respect to the care of the sick, the aged, and the unfortunate, the endowment amounting to about \$80,000. The officers in 1931-32 were: President, Inez Haynes Irwin; vice president, Marc Connelly; secretary and treasurer, Luise Silcox. Headquarters are at 2 East Twenty-third Street, New York City.

**AUTOGIRO.** See AERONAUTICS.

**AUTOMOBILE RACING.** Freddy Frame, of Los Angeles, despite his remarkable triumph in the annual 500-mile Indianapolis Classic on Memorial Day, again finished second in the American Automobile Association ranking for automobile racing champion of 1932. Bob Carey, of Anderson, Indiana, fourth in the big event, did so well in other races during the season that he amassed 815 points to Frame's 710. Carey finished second to Bill Cummings, of Indianapolis, in the Oakland, Calif., 150-mile race in November and thereby clinched the title when Frame and Howdy Wilcox failed to finish. Wilcox finished third for the year with a total of 610 points. In winning the long race at Indianapolis, Frame broke all existing records for the race, completing the distance in 4:48:03.79 to average 104.144 miles an hour.

Sir Malcolm Campbell, British racing driver, set a new world's record for speed in a spin along the sand of Daytona Beach, Florida late in February. He was timed for a mile in 253.968 miles an hour, exceeding by 8.235 miles an hour the record he made in 1931 over the same course.

**AUTOMOBILES.** Through 1932 automobile production dropped to the lowest volume since 1918. The total number of cars and trucks in the United States and Canada was 1,436,000. This was nearly a million less than the number produced in 1931 or a decrease of 42 per cent.

More and more the industry has been deferring the bringing out of new models until nearly the end of the year. Very few appeared before the last month of the year, and some were not announced until after the end of the year, receiving their first public display at the Automobile Show.

In number of cylinders provided in standard lines there were several changes. In the middle of the year Hudson brought out a new line smaller than the Essex called the Terraplane. This was a six. At the end of the year an additional model slightly larger was introduced and also an eight-cylinder Terraplane. At the same time the Hudson Super Six was restored as an addition to the line of eights that have been built since 1930. The Plymouth dropped the four to build a six and the Pontiac was changed from a V-eight to a straight eight. New fours were the Willys and the Continental. The Continental also had two sixes in the low and medium-low priced groups. There was an increased use of eight-cylinder engines in commercial vehicles and one attempt to introduce the Diesel engine in trucks.

At no time in the history of the industry has there been so much offered for the price. In the past three years the manufacturers have cut their costs but without skimping quality. A few years ago the lowest-priced cars made no pretense to beauty. They were marketed on an econ-

omy basis and no effort was made to rival the appearance of the higher-priced lines. Now the cheapest cars have well-nigh caught up with the best in looks and performance and have been so improved in riding qualities by the reduction of vibration that they now have everything but the longer wheelbase, greater commodiousness and luxury of refinements found in the better cars. Several of even the lowest-priced cars have somewhat increased wheelbase and seat width. There has been a marked disposition on the part of the higher-priced car builders to extend their lines down into the low- or medium-low priced fields and to reduce the price of their best models, and to make those largely a custom business with more options for the individual owner's specification.

Throughout the lines to be displayed at the National Shows in January, 1933 are by far the most attractive that have ever been offered to the motoring public.

It seemed that the 1932 models had everything that could be looked for until some radical improvements in engineering or design had been developed with the progress of the industry, but the 1933 models have an even greater appeal to the customer dollar. While there was little that is radically new in mechanical detail such faults as were found in the newer features of the 1932 models have been corrected by the year's experience.

The new lines showed still further accomplishment in simplification of control. Silent gear shifting and smooth engagement of the clutch are no longer dependent on driver dexterity, and braking has become almost effortless. Separate starting pedals are disappearing, the starting being combined with the depression of the accelerator, the turning of the ignition key, or the pressing of a button on the dash. Power brakes were featured by several makers and among other mechanical improvements were the automatic choke and thermostatic shock absorbers. Rubber mounting of engines had become the accepted practice.

Each year sees a greater approach to true aerodynamic lines which many predict will culminate in the so-called "tear-drop" design with the engine shifted from the front to the rear. The most extreme car shown was one Pierce-Arrow model that came as near to the ideal of minimized wind resistance as is possible with engine at the front and the wheels not recessed into the body. The new Willys was the most radical design but most makers, fearing to chance public acceptance of revolutionary changes, preferred to follow the more gradual transition. This was shown in the very general trend to sloping and pointed radiator guards, petticoated or valanced fenders and concave or "beaver-tail" rear panels.

Probably the most heralded innovation was draftless ventilation. All of the General Motors cars had this Fisher body improvement of pivoted window sections and several other lines had some way of accomplishing comfortable air change in the car interior.

**STATISTICS.** As customary, toward the close of the year the National Automobile Chamber of Commerce gave out its preliminary statement of facts and figures for the automobile industry from which the following information was taken.

The before-mentioned total production for the United States and Canada of 1,436,000 vehicles

included 1,198,500 passenger cars and 237,500 motor trucks. Of the passenger cars, 1,115,000, or 93 per cent were closed models. The wholesale value of the passenger cars was \$646,500,000 and of the trucks \$138,000,000, making the total wholesale value of the vehicles produced during the year \$784,500,000. The average retail price of cars was \$720 and of trucks \$776.

Tire manufacturers in the United States shipped during the year 41,150,000 tires. The wholesale value of those sold to consumers for replacement was \$275,000,000. Parts and accessories for replacement and service equipment sold during the year totaled in wholesale value \$250,000,000. The year's total business in vehicles and equipment was therefore \$1,309,500,000. The retail value, including taxes, of the gasoline consumed by motor vehicles was \$2,382,000,000, and of lubricating oil \$359,100,000.

The computed number of motor vehicles in use throughout the world in 1932 was 33,026,000. Of this the United States registration was 73 per cent, or 24,276,000, made up of 21,045,000 passenger cars and 3,231,000 commercial vehicles. The first falling off in registration came in 1931 when there was a decrease of 2.8 per cent from the previous year. In 1932 there was a further decline from 1931 of 6 per cent.

Roughly a quarter of all motor vehicles in the States, 4,980,000, are owned by farmers, 4,100,000 of them being passenger cars and 880,000 trucks.

There was a small amount of new road building. The United States now has a total of 3,055,000 miles of highways of which 868,000 miles are surfaced. The expenditures on highways and streets for the year aggregated \$1,900,000,000. In motor vehicle and allied lines the persons employed numbered about 3,700,000.

One class of figures that suffered no loss was taxes. The industry views with alarm the steadily mounting imposition of taxes on motor vehicle users. In 1932 it reached the enormous sum of \$1,085,000,000, an increase of 6 per cent over 1931. This included registration fees, gasoline taxes, excise taxes, and personal property and municipal taxes. The gasoline taxes alone, Federal, State, and municipal, amounted to \$595,000,000. In ten years the special motor taxes per vehicle increased 179 per cent. The service station value of gasoline, without taxes, was \$1,787,500,000 to which the consumer had to pay an added 33 per cent for taxes. Motor users during the year paid 12 per cent of all taxes collected by the Federal, State, and local governments.

The automobile industry continued to be the largest manufacturing industry based on the value of finished products. This industry is the largest purchaser of gasoline, rubber, alloy steel, and malleable iron, mohair, upholstery, leather, lubricating oil, plate glass, nickel, and lead. Of the total consumption during the year of the following products the automobile industry took 83 per cent of the rubber; 55 per cent of the plate glass; 17 per cent of the steel and iron; 14 per cent of the lumber and hardwood; 15 per cent of the copper; 14 per cent of the lead; 20 per cent of the aluminum; 26 per cent of the nickel; 12 per cent of the tin; 7 per cent of the zinc, and 85 per cent of the gasoline. The gasoline used by motor vehicles in 1932 was 320,000,000 barrels of 42 gallons. Lubricants used by motor vehicles aggregated 9,600,000 barrels, about 57 per cent of all lubricants used. The

crude rubber used by the motor industry during the year amounted to 589,000,000 pounds, and the cotton fabric that went into tires weighed 165,000,000 pounds.

Rather interesting is the break-down of the use of commercial vehicles. Of the 3,231,000 trucks in use, the 880,000 owned by farmers represent 27 per cent. Altogether there are 2,500,000 owners of trucks. Five and one-half per cent of trucks are operated as common carriers. Slightly over 1 per cent of them do an interstate business, the others confining their operation to hauling within their States. The contract carriers are about 8.7 per cent of all trucks in use and 85.8 per cent are privately owned and operated. While trucks are only 13 per cent of all motor vehicles in use, they pay 27 per cent of all motor taxes. The past year the truck taxes amounted to \$290,000,000. One hundred railroads use trucks as part of their shipping service; 12,000 trucks were so used last year by the steam railroads. The Railroad Express Agency is the owner of 9247 trucks.

Motor busses have become a sizable portion of the commercial vehicles in use. In 1932 there were registered 99,000 motor busses. Of these 45,000 were revenue carrier busses. The 16,700 consolidated schools using motor transportation operate 52,000 busses; 12,000 busses are used by 245 street railways and 4800 busses by 80 steam railroads.

Foreign sales of American motor vehicles suffered a heavy decrease from 1931—44 per cent. The United States exports and the output of United States owned Canadian plants combined was 182,000 vehicles, but it represented 13 per cent of the production. The value of motor vehicles, parts, and tires exported from the United States and Canada was \$93,125,000.

The motor vehicle retail business in the United States has naturally shrunk considerably from the peak year of 1929 with the tremendous decline of new car business, but, the cars in use having diminished relatively little, the business in service and supplies has been fairly well maintained, although users have cut their requirements to the necessities. As it stood at the end of 1932 the total car and truck dealers numbered 39,871, the garages, service stations, and repair shops 97,721, supply stores 69,179, and the total retail outlets, with duplications eliminated, 103,605. The gasoline filling stations were estimated at 350,000.

LEGISLATION. Most States have regular sessions of their legislatures only alternate years. In 1932 only nine States were in regular session, but there were about ten other States that held special sessions in which automotive subjects were considered. In the proposed legislation that which most disturbed the automobile and allied interests, including those involved as shippers by or users of motor vehicles, were bills calling for increases in special taxes applicable to motor trucks, increases in the taxes on gasoline, and diversion of the proceeds of such taxes to other than highway uses, reductions of maximum size and weight restrictions, and wider applications of regulations to the operation of "for hire" vehicles, coupled, in some instances, with more stringent regulation. The view held by the automotive industry with reference to special taxes and gas taxes for motor vehicles is that such taxes should be fixed at rates no higher than will be necessary to meet the administration expenses

in connection with the collection of such taxes and produce the necessary revenue for highway purposes. The industry is opposed to any diversions of such funds to other purposes, such as, schools, unemployment relief, inland waterways, or State general funds, as is being done in some of the States with the gasoline taxes. It grants the need of certain regulation for common carrier vehicles, but does not favor extension of regulation to other carriers "for hire," or to privately owned vehicles. The industry concedes the necessity of limiting the weight and size of vehicles for safety's sake and preservation of the roads, and is quite generally in accord with the recommendations made in November of this year by the American Association of State Highway Officials, but opposes restrictions that would tend to hamper the development of highway transportation.

The depression aggravated the disposition to increase taxes of all kinds on motor vehicles in the efforts of the States to recover loss of income from other sources and to balance their budgets, and the taxation of commercial vehicles in several States reached amounts that so increased the cost of operation that profit was impossible at prices at which business could be obtained.

On the more favorable side was the action of New Jersey, which adopted a law granting full reciprocity to all vehicles, a non-resident operator being granted the same privileges in New Jersey under his home State license that a New Jersey operator is granted in the home State of the non-resident operator.

New Jersey also adopted, and was the first State to do so, a law requiring trucks and busses to carry directional signals to indicate their intended turns, the devices to be illuminated at night and to have been approved by the Motor Vehicle Department. Before the law went into effect its constitutionality was attacked and a temporary injunction issued restraining its enforcement.

Two additional States undertook to put a ban on solid tires after a certain time, one on all vehicles and the other on vehicles of over two tons gross weight, as a measure of protection for the roads. Other States have discouraged use of solid tires by increasing mileage taxes, registration fees or privilege taxes on vehicles so equipped. Usually States have not found either course necessary as owners of themselves have been discarding solid tires in favor of pneumatic because of the saving in wear and tear on the vehicle and lessened damage to goods handled.

Texas and Kentucky were two States in which legislative developments aroused special protest from motor vehicle users. Texas had enacted laws the previous year limiting loads to 7000 pounds and extending regulation to contract carriers. Two appeals were made to the Supreme Court to have these laws set aside, but they were denied. Kentucky drastically reduced the allowable gross weight of motor vehicles, but even more alarming to commercial haulers was its act prohibiting the use of trailers of any kind.

**AVIATION.** See **AERONAUTICS.**

**AZERBAIJAN**, ä'zër-bijän' (**AZERBAIDZHAN**). The Azerbaijan Socialist Soviet Republic, established Apr. 28, 1930, united with Armenia and Georgia on Jan. 16, 1923, to form the Transcaucasian Socialist Federated Soviet Republic (q.v.). Occupying the southeastern frontier region of Transcaucasia between the

Caspian Sea and Persia. Azerbaijan, which includes the Nazhichevan Soviet Socialist Republic and the Nagorni Karabakh Autonomous Region, has an area of 32,686 square miles and a population of 2,510,809 in 1931; 75 per cent are Moslems. Capital, Baku, with a population (1926) of 452,000.

In 1929-30 there were 1479 elementary schools, with 180,200 pupils; 40 technical schools, with 10,000 pupils; and five institutions of higher education, with 5500 students. Agriculture, cattle-breeding, and the exploitation of the extensive Baku oil fields are the principal industries. There were 2,718,100 acres under cultivation in 1929-30, of which 370,650 acres were devoted to cotton. In August, 1931, 41.4 per cent of all peasant farms were collectivized. Oil production in 1929-30 was 10,900,000 tons (8,802,000 tons in 1928-29). Copper, textiles, fisheries, and salt are other leading industries. The total production of state industries other than oil in 1929-30 was valued at 75,900,000,000 roubles (1 rouble = \$0.51 in U.S.S.R.). See **UNION OF SOVIET SOCIALIST REPUBLICS.**

**AZORES**, ä-zörz'. An archipelago in the North Atlantic, situated about 800 miles west of Portugal, of which the Azores are politically an integral part. Area, 922 square miles; population (census of 1930) 253,596. The capital is Angra (population in 1926 was 10,057) on the island of Terceira.

**BACON**, BENJAMIN WISNEE. An American theologian, died in New Haven, Conn., Feb. 1, 1932. He was born in Litchfield, Conn., Jan. 15, 1860, and was graduated from Yale College in 1881 and from the Yale Divinity School in 1884. Following his ordination to the Congregational ministry he held pastorates in Old Lyme, Conn. (1884-89) and in Oswego, N. Y. (1889-96). He then became an instructor in New Testament Greek at the Yale Divinity School, and from 1897 until his retirement in 1928 was professor of New Testament criticism and exegesis. During 1905-06 he was director of the American School of Archaeology in Palestine and Syria, and in 1928, through his negotiations, Yale University received a commission from the British Government to cooperate with the British School of Archaeology in excavating part of the ancient city of Jerash (Gerasa), Palestine. He was an associate editor of the *Hibbert Journal* and of the *American Journal of Theology* and was the author of *The Genesis of Genesis* (1891); *Triple Tradition of the Exodus* (1894); *The Sermon on the Mount* (1902); *The Story of St. Paul* (1904); *The Founding of the Church* (1909); *The Fourth Gospel in Research and Debate* (1909); *Jesus, the Son of God* (1911); *Christianity Old and New* (1913); *Is Mark a Roman Gospel?* (1919); *Jesus and Paul* (1920); *The Teaching Ministry for Tomorrow* (1923); *The Gospel of Mark, Its Composition and Date* (1925); *The Apostolic Message* (1925); *Studies in Matthew* (1930).

**BACTERIA**, COLORBING MATTER OF. See **CHEMISTRY, INDUSTRIAL.**

**BADEN**, ba'den. A constituent state of the German Republic, with a republican form of government established by the Constitution of Mar. 21, 1919. Formerly a grand duchy in the German Empire, it borders on Alsace-Lorraine and Switzerland on the west and south, respectively.

Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. In 1930 there were 44,179 births, 26,838 deaths, and 18,089 marriages. Capital, Karlsruhe, with 145,604 inhabitants in 1925. The largest city is Mannheim (247,486 in 1925). The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education, there are universities at Heidelberg and Freiburg. In 1931 the total area under cultivation was 1,819,195 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important. There are numerous manufacturing industries and salt and potash are mined.

The Landtag elected Oct. 27, 1929, for the term ending Oct. 27, 1933, had 88 members, including 35 Centrists, 18 Socialists, and representatives of seven other parties. State President in 1932, Dr. Josef Schmitt (Centre party). See GERMANY.

**BADGER.** REAR ADMIRAL CHARLES JOHNSTON, U. S. N., RET. An American naval officer, died at Blue Ridge Summit, Pa., Sept. 7, 1932. He was born in Rockville, Md., Aug. 6, 1853, and was graduated in 1873 from the U. S. Naval Academy, to which he had been appointed at large by President Grant. Promoted through the grades, he became captain in 1907, and in that year was also appointed superintendent at Annapolis. During the world cruise of the Atlantic fleet in 1909-11 he commanded the battleship *Kansas*. In 1911 he was commander of the second division of the Atlantic fleet, with the rank of rear admiral, and in 1913 assumed command of the entire fleet. The following year he had charge of naval operations in Mexican waters during the occupation of Vera Cruz. In 1914 he was appointed to the General Board and on the death of Admiral George Dewey in 1917 became chairman of the executive committee. This board rendered a great service in advising the Secretary of the Navy concerning the navy's participation in the World War. He retired from the navy in 1915 and from the General Board in 1921.

**BAHÁ'Í FAITH.** A religious movement, founded in Persia in 1844 by Mirza Ali Muhammed, known as the Báb (the Gate or Forerunner of the Cause). Its universal principles include the oneness of mankind; the abolition of racial, patriotic, class, political, and religious prejudices; the harmony of true science and religion; the spiritual equality of men and women; the education of all people in terms of the complete personality, and the continuance of education throughout life by unceasing open-minded search for truth; economic righteousness and justice; the addition of a universal auxiliary language to school curricula; the prohibition of a professional clergy in the Bahá'í Faith; the spiritual obligation of every government to make world peace its first and most important concern; and the organization of an international tribunal capable of maintaining world order, based upon equal justice to the various nations and peoples. These principles, following the martyrdom of the Báb at Tabriz in 1850, were proclaimed to the world over a period of 40 years by Bahá'u'lláh (the Author of the Cause). After Bahá'u'lláh's death in 1892 the head of the movement was his son, Abdu'l-Bahá (the True Exemplar and Interpreter of the Cause) who, in turn, was succeeded on his death in 1921 by his grandson Shoghi Effendi (the Guardian of the Cause).

Among the outstanding activities reported for 1932 were the publication of a new English translation, made by Shoghi Effendi, of *The Tablet of Iqan* (Book of Certitude), one of the fundamental texts of the Bahá'í scriptures; the publication for the first time in English of *The Dawn-Breakers: Nabíl's Narrative of the Early Days of the Bahá'í Revelation*; and publication of Chinese, Persian, Urdu, German, Russian, and Esperanto translations of Esslemont's *Bahá'u'lláh and the New Era* (making a total of 22 translations of this book). There took place also the recognition of five new spiritual assemblies in America; the formation of the first local spiritual assembly in Japan; the liberation of Persian Bahá'ís from long-standing civil disabilities, making possible the beginning of the first official and complete census of Bahá'ís in Persia, and the participation by Persian Bahá'í women in the election of local and national spiritual assemblies; the incorporation of a Palestine branch of the American National Spiritual Assembly to hold title to the American Pilgrim House at Haifa and to the tract of land on Mount Carmel adjoining the tomb of the Báb purchased by American believers; and formal appeal by the National Spiritual Assembly of Egyptian Bahá'ís to their government to remove the disabilities suffered under Mohammedan law in the absence of a civil code guaranteeing rights of religious minorities.

A local spiritual assembly is established in every locality where the number of adult declared believers exceeds nine. The work of these assemblies is coordinated through another elected body of nine members, the national spiritual assembly. In 1932 there were 53 local assemblies and some 24 groups in the United States and Canada with 2360 members. Throughout the world there were nine national assemblies and approximately 400 local assemblies and groups. Among the countries in which spiritual assemblies are found are Australia, Brazil, Caucasus, China, Dutch East Indies, Egypt, England, France, Germany, India and Burma, Iraq, Japan, New Zealand, Palestine, Persia, South Africa, Switzerland, Syria, Tasmania, Turkey, Turkistan, and the U.S.S.R.

The 1932 convention of the National Spiritual Assembly of the Bahá'ís of the United States and Canada was held in the foundation hall of the temple at Wilmette, Ill., April 29 to May 1. This temple, called Mashriqu'l-Adhkar (the Dawning Place of the Praise of God), was structurally completed in 1930. Its external decoration was preceding, there being signed in 1932 a contract between the Bahá'í trustees and the John J. Earley Studio of Washington, D. C., for the decoration of the dome in accordance with the unique design made by the architect, the late Louis J. Bourgeois. Official American publications are: *The Bahá'í Magazine*, *Star of the West*; *Bahá'ís News*; and the *Bahá'í World* (the biennial international record). National headquarters are at Evergreen Cabin, West Englewood, N. J., Horace Holley, secretary. World headquarters are in Haifa, Palestine.

**BAHAMAS.** A group of British-owned islands off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 661 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1931 of 59,828, or 6797 more than at

the census of 1921. The important islands with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; Cat Island 4273. Government primary schools in 1930 enrolled 10,308 pupils; aided schools, 3347 pupils; private schools 1524. In the same year, attendance at private and government secondary schools totaled 471.

Declared imports greatly exceed declared exports, the totals in 1931 being £1,249,027 and £287,562 respectively. Spirits and wines, the leading imports, were valued (1930) at £27,525, compared with £49,077 for iron and steel manufactures, which ranked second in value. Sponges and sisal are the chief exports. Imports from the United States (1930) were valued at £604,506; Canada, £511,010; United Kingdom, £322,950. Revenues in the fiscal year 1931-32 totaled £386,374; expenditures, £422,700. The public debt in 1931-32 stood at £180,000. Vessels entering the ports in 1930 numbered 1414 of 1,521,803 tons and vessels clearing, 1425 of 1,460,905 tons. Regular air-mail and passenger service between Palm Beach, Fla., and the Bahamas was inaugurated June 5, 1931. During a storm and tidal wave on Sept. 5, 1932, 11 persons lost their lives on the island of Abaco. The islands are administered by a governor who is assisted by an executive council and a legislative council, each of 9 members, and a representative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-Chief in 1932, Capt. B. E. H. Clifford.

**BANG,** bäng, BERNHARD LAURITS FREDERIK. A Danish bacteriologist, born in 1848 and died in Copenhagen June 22, 1932, aged 83. From 1892 to 1914 he was professor of pathology and therapy at the Royal Veterinary and Agricultural College in Copenhagen, where he became widely known for his researches in veterinary science. In 1896, in collaboration with Stribolt, he discovered the cause of contagious abortion in cattle and subsequently studied its treatment and possibility of immunization. In 1892 he originated the Bang method of eradicating tuberculosis from dairy herds, which consists of isolating the mildly affected animals and feeding artificially their calves with milk free from tubercle bacilli. This method has been extensively applied in Denmark, Norway, and Sweden with favorable results. Dr. Bang was a member of the Danish Academy of Science and of many foreign academies, and was the author of *Om Tuberkulose i Koens 1ver og om tuberkulos Maelk* (1884) and *Om Arsgen til lokal Nekrose* (1890).

**BANGKA.** See NETHERLAND INDIA.

**BANKERS' ASSOCIATION. AMERICAN.** The dominant national organization of banks in the United States, having a membership of about 16,000 banks out of a total of 19,000, with assets estimated in excess of 90 per cent of the nation's aggregate banking capital funds of \$8,500,000,000

and total resources of \$80,000,000,000. The association has four major divisions, each devoted to the special interests, technical advancement, and general welfare of the following classes of banks: National, savings, State, and trust company. Within the organization there are also two sections devoted to general banking interests: the American Institute of Banking section and the State secretaries section. The American Institute of Banking section, which is the educational arm of the organization, has an enrollment of 45,000 students from banks in all parts of the country and a general membership of 65,000; the State secretaries section forms a link between the national organization and the 48 State Bankers' Associations.

The association has a protective department which prosecutes continually a nation-wide campaign of prevention, protection, and investigation for all member banks in respect to criminal operations. It conducts a legal department which keeps bankers informed on developments in the field of banking law and, in connection with the association's State and Federal legislative committees and councils, watches the interests of banking institutions and the public in both State and Federal banking legislation. During the year this department secured effective public action against several depression-born legislative measures that were deemed harmful or uncalled for. The association gave also special attention to maintaining equitable bank taxation and, through its economic policy commission, conducted studies of the branch banking question, causes of bank failures, proposed remedial legislation, maintenance of the dual banking system under State and national charters, reconstruction finance proposals, and basic changes in bank credit conditions and methods.

The educational foundation of the association, with an endowment of \$500,000 to be employed in the furtherance of scholarships and research in banking and finance in educational institutions, allocated 200 loan scholarships valued at \$250 each to students in American colleges. In addition, its public education commission conducted lectures on banking in public and private schools and before civic clubs throughout the United States, and the bank management commission developed active studies and methods for more scientific bank management.

The association holds its annual convention in the autumn of each year, while the executive council meets in the spring. The latter group is a representative body, proportioned to the membership in all States, and is qualified to take action upon certain association matters. The administrative committee, composed of 15 members, including the national officers, heads of the various divisions and sections, and certain others, acts as the *ad interim* governing authority between meetings of the convention and of the executive council. The 1932 convention was held in Los Angeles, Calif., October 3-6, the chief topics of discussion being excessive government expenditures and taxation, branch banking, methods for improving bank management, and the bank failure situation. It expressed in general resolutions approval of the Federal Reserve system and the Reconstruction Finance Corporation and their policies in meeting depression conditions.

The general national officers elected for 1932-33 were: president, Francis H. Sisson, vice-

president, Guaranty Trust Co., New York City; first vice-president, F. M. Law, president, First National Bank, Houston, Tex.; second vice-president, Rudolf S. Hecht, president, Hibernia Bank & Trust Co., New Orleans, La.; treasurer, P. D. Houston, chairman, American National Bank, Nashville, Tenn. The continuing activities of the association are carried on by a permanent staff, functioning at the national headquarters in New York City under the direction of the executive manager, Fred N. Shepherd.

#### **BANKING AND CURRENCY COMMISSION OF THE U. S. SENATE. See BANKS AND BANKING; FINANCIAL REVIEW.**

**BANKS AND BANKING.** The end of the year 1931 found the status of American banking more hazardous than for a great while past. Failures were taking place in enormous numbers; and, while most of them had been small in size, not a few larger institutions were known to have been endangered. The action of the bankers of the country in forming The National Credit Corporation had brought temporary reassurance, which had at once given place to renewed anxiety, owing to the inactivity of the new enterprise and its apparent unwillingness to call upon its subscribers for contributions of actual capital. In these circumstances, the administration of President Hoover deemed it desirable to undertake some systematic aid to the banks of the country, and primarily for this assistance—though also to help other embarrassed organi-

zations,—the "Reconstruction Finance Corporation" was established by act of Jan. 22, 1932. This institution, with a capital of \$500,000,000, and a power to issue debentures amounting to \$1,500,000,000 (guaranteed by the Treasury department), at once began making loans to embarrassed institutions. Before the close of the twelve months, it had thus assisted some 5000 banks and trust companies, according to the annual report of the corporation. Nevertheless, the failure of banks continued, near 1400 failures or embarrassments being announced during the year and among them some of large size. The result was a great loss of confidence in banks, and during the middle of the year a tendency to widespread hoarding, which came close to driving the nation off the gold standard—according to the testimony of various public men, and other authorities, notwithstanding the dissenting opinion of certain critics. Throughout 1932, the banks continued the struggle to recover their equilibrium; and the year was possibly more disturbing in its effects upon the banking organization, than any for a great while.

**NATIONAL BANKS.** The national system, while, on the whole, rather less subject to the danger of failure than the banking systems of the several States, nevertheless underwent the same disasters, in general, that afflicted other parts of the banking structure. The fact that the whole question of banking was under examination, and that the immediate problem of the moment was admittedly that of preserving the very existence of the system upon its former footing, doubtless tended to retard the usual flow of minor measures for reform of banking technique, toward

the statute books. The Acting Comptroller of the Currency, in his annual report for the year 1931-32, called attention to the situation; and renewed certain recommendations previously made; while the Secretary of the Treasury called for the introduction of early provision for branch banking. The Comptroller, moreover, devoted a substantial portion of his discussion to a statement of the position as to bank failures; and called attention to the urgent necessity of better management in view of the evil effects of deficient ability in the conduct of banking affairs.

The system had in fact suffered most severely from the effects of the general break-down of economic conditions; and the statistical showing made by the national office of supervision, was correspondingly discouraging. For the year covered by the report, the system showed a net decrease of 515 members or 7.78 per cent, leaving only 6104 active national institutions. Resources suffered along with membership, and for the year ending June 30, 1932, there was a decline of aggregate resources totaling nearly \$5,275,000,000 leaving the resulting total \$22,367,711,000—the smallest figure for many years. The total number of receiverships established during the year was 380, as against 237 the preceding year, although this latter figure had itself been double the number for the last year then preceding. This unfortunate record had been closely under discussion; and Congress had considered several measures for the reform of banking; but only sporadic changes in legislation (later to be more specifically considered) were able to reach the statute book.

value, the good assets of failed banks; and so to enable the immediate payment of their worth to depositors in such institutions, thus preventing the latter from undergoing further loss as a result of the postponement of liquidation through the long-drawn receiverships, averaging five and one half years, which had become customary in the national system. Further important changes were suggested in sections which undertook to authorize "State wide" branch banking, on a national scale, for national banks, irrespective of the provisions of law in the several States themselves.

This measure did not become law, largely owing to the opposition of the administration to various of its provisions; but, after being debated in the Senate, was laid on the table until the arrival of the winter session 1932-1933, when it was again taken up and placed on the calendar. Meantime, conditions in the national, as well as in the State banking systems generally, were cared for by the concern known as the Reconstruction Finance Corporation (act of Jan. 22, 1932 already briefly referred to)—whose function it was to make advances to hard-pressed banks and other financial corporations including railroads, with the purpose of preventing receiverships on the part of those enterprises which (although presumably solvent) could not furnish the kind of paper which would render them eligible customers for rediscount accommodation at Federal reserve banks. The new enterprise worked at high speed, and before the close of the year had nearly 5100 banks as clients receiving relief while it had authorized loans amounting

CONGRESSIONAL DISCUSSIONS. Investigations made by the Banking and Currency Committee of the United States Senate, which had been begun the year previous, reached, at the beginning of 1932, a climax, with the completion by a subcommittee of that organization of a measure eventually introduced into the Senate accompanied by a favorable report presented by the chairman of the committee, of the so-called Glass bill (S. 4412). This bill aimed at the protection of the national bank, and federal reserve systems from the further development of the disastrous conditions that had been allowed to spring up under past management and supervision. The bill in question further sought to bring about a separation of the so-called "affiliates" from the parent banks which had been responsible for their establishment; and incidentally thereby undertook to end the practice of devoting so large a proportion of depositors' money to stock-market manipulations and transactions. Relations between banks and stock operators were more strictly controlled; and various provisions designed to safeguard the portfolios of national and member banks were prescribed. The bill further undertook the establishment of a national "liquidating corporation," whose mission it would be to purchase, at true

to nearly \$2,000,000,000 of which about two-thirds was for the assistance of banks and banking institutions generally.

In spite of these forms of relief, the economic condition of the country continued to be so unfavorable as to force repeated bank failures in great numbers, the total at the close of the calendar year being about 1453. While this figure represented a considerable reduction from the 2300 of the preceding year, the falling off was not sufficient to give warrant for a feeling that the real evils of the case had been met and the demand for real remedial measures continued. A widespread demand for some measure that would enlarge the supply of currency and so (it was erroneously presumed) enlarge the commodity structure led, just at the close of the session of Congress, to the hasty adoption of an amendment to the so-called "Home Loan Bank measure" whereby the national banking institutions were permitted to issue currency by extending for a period of three years the privilege of issue upon all bonds of the United States bearing 3½ per cent or less. The President in signing the home loan act stated his disapproval of the step so taken, but issues of notes under the new measure although theoretically possible up to about \$1,000,000,000 were actually issued

to the extent of only some \$143,000,000 during the year. They displaced about an equal amount of federal reserve notes but apparently had no effect in changing the total supply of notes in circulation. None of the discussions or measures initiated by the Comptroller's office, or by Congress, either relieved the real underlying situation or assisted the improvement of the banking position. As will be seen from the table furnished on a preceding page, the result of the operations of the year was nothing more than a steady decline of volume and profitableness of the national banks, even if we disregard the disastrous failure and receivership record made during the period. As seen from the table in question, the statement of national banks indicated a shrinkage of demand deposits by 21 per cent, of time deposits by 15 per cent, of loans and discounts by 21 per cent, with other items in corresponding proportions. Falling off of commercial paper loans, as shown for all member banks by the table already given, indicated conclusively the reduction of the volume of sound commercial business but it also, probably, reflected the unwillingness of many banks to assume any risk they could avoid, and hence their refusal to discount business paper which in former years they would gladly have accepted. The change in the composition of investment account from ordinary corporation issues to government bonds, in large measure, reflected the unwholesome tendency to reject ordinary securities, and to make the banks largely investors in the huge volume of public securities that was being poured forth by the Treasury in the endeavor to meet the deficit in the budget.

assets and not on numbers showed far less difference between the larger and smaller institutions than had previously been supposed. Among State and among national banks, there was a decided disposition to limit the accommodation extended to business firms and corporations, and to invest the assets of the several institutions in government securities and in acceptances, with a view to maintaining a theoretical liquidity, and so presumably safeguarding the institutions against possible "runs" from depositors.

**FEDERAL RESERVE BANKS.** These banks had, for a long time, been nearly cut off from member institutions, and after the organization of the Reconstruction Finance Corporation the Reserve institutions became practically isolated from the real every-day work of bank administration. Their activities tended, more and more, to fall into lines determined by the necessities of the Treasury, and their nominally commercial operations were designed with the relief of the Treasury always in mind. Since the money market had thus come to depend directly upon Treasury operations this state of affairs meant that the Reserve banks more than ever assumed the rôle of stock market auxiliaries but the unwillingness or inability of the community to go further into market transactions prevented the operations of Reserve institutions from assuming any importance, save in connection with the public financing. The only exception to this general statement was afforded by the remarkable movement of gold to foreign countries which had set in during the preceding autumn of 1931. After a brief respite, extending during January, 1932, the withdrawals of gold recommenced,

+ Increase. — Decrease.

**STATE BANKS AND TRUST COMPANIES.** In all these misfortunes, the national banks did not much differ from the conditions prevalent among the State banks and trust companies. The necessity of revaluing securities; and of writing off assets, was the same in its application to both systems; and the resulting influence upon their balance sheet position was nearly identical in the various groups of banks. Difficulty was conclusively seen to be not the result of types of legislation under which the banks were organized, but rather the outcome of business conditions and of general bad management in banking, without which no such débâcle could reasonably have been looked for. The differences between groups of banks were not those derived from legislative or organization conditions, but were rather geographical. Failures, on the whole, were more numerous in the West and South, and among small banks, rather than among large ones, though comparisons of failures based upon

stimulated by the unfortunate announcement made by the Reserve Bank of New York on January 12, that a general inflation policy was to be inaugurated. This emphasized the feeling of foreigners that there was danger; and heavy withdrawals of gold followed. By the close of June, practically all of the large foreign bank balances formerly kept in the United States, had been withdrawn; and the actual gold representing them, exported. The movement gave rise to fears at home, and considerable hoarding (once officially estimated at close to \$1,500,000,000) followed. This gold movement had, however, hardly come to an end, when conditions of international trade necessitated shipments to the United States and these culminated with the shipments made during December by Great Britain and other countries, for the purpose of providing a means for the settlement of the December installment of the international debts. By the close of the year, gold holdings were prac-

tically at peak for the twelve months, the entire withdrawals having been made up by new shipments, and the total on hand being thus about \$4,500,000,000. In all these transactions, the Reserve System played a passive rôle, keeping

management never reached a time when it was willing to proceed with such a policy. The position of the reserve banks as the result of the year's operations, is stated in the accompanying table.

TWELVE FEDERAL RESERVE BANKS COMBINED  
[In thousands of dollars—000 omitted]

RESOURCES

Ratio of total reserves to deposit and Federal Reserve note liabilities combined	63 0%	62 7%	65.5%
Contingent liability on bills purchased for foreign correspondents	\$40,157	\$36,338	\$269,544

its discount rate low and doing nothing either to obstruct, or to encourage, the movement of gold. The position of the reserve system was, however, far more profoundly affected by the adoption of the inflation policy already referred to as having been announced in January. That announcement caused so much protest that the actual and effective application of the proposed plan had to be temporarily suspended, but the project was resumed as soon as possible, and during the spring months, was applied through the purchase of large quantities of government securities. In all, some \$1,000,000,000 had been acquired before June 30 giving the system a total holding of about \$1,900,000,000, the largest in the history of the system and correspondingly hazarding the rediscounting power of the reserve banks, while "freezing" their assets more or less completely. Although, during the latter part of the year, the idea of disposing of these securities was frequently under discussion, the reserve

BANK CREDIT. In spite of the constant effort to enlarge bank credit outstanding, in the erroneous hope that price advances would result, the year's operations had no such effect. Throughout 1932, the decline of total bank credit was quite steady. This was due to the combination of causes already enumerated, but the retirement of credit commitments was not confined to commercial loans. Notwithstanding that speculative credit, as reflected in brokers' loans, had already reached a low mark during the preceding year, the falling off continued. There was a brief period of temporary expansion when (for reasons which will be elsewhere set forth) the stock market had a transitory recovery during the summer months (see Article *Financial Review*). This recovery, however, proved merely a passing change, and the decline of loans continued, as shown in the accompanying table on page 88.

BANK FAILURES. Brief reference has already been made to the failure record of the national

## BROKERS' LOANS, 1932

January 30 . . . \$512,017,000	July 30 . . . \$241,599,000
February 29 . . . 524,663,000	August 31 . . . 331,699,000
March 31 . . . 533,103,000	September 30 . . . 379,801,000
April 30 . . . 379,016,000	October 31 . . . 324,702,000
May 31 . . . 300,397,000	November 30 . . . 337,612,000
June 30 . . . 243,574,000	December 31 . . . 347,000,000

banking system. The conditions in the latter, however, were more than paralleled by those in the State systems where the mortality of small institutions became enormous. Early in the year, the difficulties of a very large western institution caused serious anxiety throughout the nation, and during June, the difficulties in Chicago (where about 35 banks failed in a single month) caused apprehension of a general banking breakdown. The declaration of a "bank holiday" in Nevada during the autumn, with subsequent receivership of a large proportion of the State's banking institutions, were among the outstanding features of the year's record. These failures were, as already seen, only partially restrained or relieved by the work of the Reconstruction Finance Corporation, and considerable dissatisfaction with the work of the latter concern was accordingly generally felt and expressed. The favorable element in the situation was that the failures, numerous as they were, appeared to be the result of past conditions which were losing, rather than gaining, in strength; so that the year's developments were accompanied by less apprehension than those of the preceding twelvemonth.

The accompanying table reviews the history of the bank failures of 1932:

## BANK SUSPENSIONS

[Banks closed to public on account of financial difficulties by order of supervisory authorities or directors of the bank. Figures of suspensions include banks subsequently reopened]

\* Revised.

**INTERNATIONAL RELATIONS.** International banking relationships during 1932 were predominantly in the public eye in connection with the unprecedented gold movement already referred to. There was, however, important progress in the adjustment of other conditions in which the United States was deeply concerned. Two meetings were held by the international bankers' committee which had been formed to oversee the process of collecting from Germany the balances due bankers and remaining unpaid at the time of the declaration of a moratorium in Germany in 1931. The German debtors continued to make moderate payments, reducing the amount of their total obligations; but the long delays, and the difficulties inherent in the mode of procedure led not a few holders of these obligations to consider the advisability of definitely funding them once and for all into long-

term obligations. At the close of the year, this problem was still under advisement, and another meeting of the creditors' committee immediately in prospect. More far-reaching in significance was the attempt of the United States to secure resumption of the payment of war debts which had been suspended by Congress at the request of President Hoover at the end of 1931 for twelve months to end on June 30, 1932. Inasmuch as no further installment payments were, however, due until December 15, 1932, the subject was allowed to rest until after election, when seven of the debtor countries made official request for release from further payments. President Hoover had no power to grant such release, and was obliged to refuse the requests so made. Payments accordingly were made on December 15 by six of the debtor countries, while the remaining debtors defaulted (including France). The result, as already noted, was to renew the movement of gold into the United States, while serious derangements of the course of sterling and franc exchange were necessarily a concomitant of the operation. Friction and mutual recrimination naturally accompanied these operations, and the result was a correspondingly unfortunate state of affairs with, if anything, less evidence of international coöperation in banking than had been true at the close of the preceding year, when the situation was the least satisfactory that had existed at any time for many years. A visit on the part of the Governor of the Bank of England to New York during August and early September, was understood to be intended for the purpose of renewing and improving banking relationships, and of laying the foundation for a

better understanding on the debt question, came to no result.

**BANTU.** See CONGO, BELGIAN; and SOUTH AFRICA, UNION OF.

**BAPTISTS.** In 1932 there were in the United States 14 groups comprised in the denomination known as Baptist, which maintains that baptism should be administered to believers only and generally by immersion. The first Baptist Church in America probably was established by Roger Williams in Providence, R. I., in 1638, although this honor is claimed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptist Convention, which, since that time, has functioned not as a

new denomination but as an organization for the purpose of directing missionary and general evangelistic work in the white Baptist churches of the Southern States. The National Baptist Convention, representing the Negro churches, was formed in 1880. Other divisions are known as Primitive, General, Regular, and United Baptists. The churches are congregational in polity, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the churches in which they hold membership.

**NORTHERN BAPTIST CONVENTION.** According to the *Annual of the Northern Baptist Convention*, 1932, this denomination was composed of 36 conventions in 35 States, and reported 414 local associations, 7919 churches, 8369 ordained ministers, 62,639 baptisms during the year, 1,445,615 members, 6537 Sunday schools, and 1,130,163 Sunday school pupils. Church property was valued at \$225,748,397, while contributions for current expenses amounted to \$20,535,513 and for beneficence to \$4,876,479.

The twenty-fifth annual meeting of the Northern Baptist Convention was held in San Francisco, Calif., July 12-17, 1932, the general theme being "Shall We Be Christians?" The keynote address was delivered by Dr. W. Q. Rosselle, pastor of the First Baptist Church of Malden, Mass. The 100th anniversaries of the American Baptist Home Mission Society and of the first singing of the hymn "America," written by a Baptist, the Rev. Samuel F. Smith, D.D., were celebrated. A campaign to raise \$500,000, supplemental to the regular budget, was launched, and new denominational objectives were provided. The officers elected for 1932 were: President, C. Oscar Johnson, D.D., St. Louis, Mo.; first vice president, Victor L. Duke, Redlands, Calif.; second vice president, Ray L. Hudson, Philadelphia, Pa.; corresponding secretary, Maurice A. Levy, D.D., Williamsport, Pa.; recording secretary, Clarence M. Gallup, D.D., Providence, R. I.; and treasurer, Orrin R. Judd, New York, N. Y. The next annual meeting was set for Washington, D. C., May 23-29, 1933.

In 1932 the Northern Baptist Convention maintained 54 educational institutions, including 10 theological seminaries, 5 training schools, 19 colleges, 6 junior colleges, and 14 academies. These institutions had 34,653 students, 2364 instructors, 573 buildings, property aggregating \$95,140,596 in value, endowments valued at \$137,551,505, and an annual income for the year of \$18,323,049. The leading denominational papers in 1932 were: *The Baptist* (Chicago); *Watchman-Examiner* (New York City); *Baptist Observer* (Indianapolis); *Baptist Banner* (Parkersburg, W. Va.); and *Baptist Record* (Pella, Iowa). In addition, most of the State conventions issued monthly bulletins, and the various foreign-speaking bodies in the United States published their own periodicals.

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, with 718 missionaries working at 126 stations. In 1932, churches numbered 3003 with 310,851 members; native workers, 10,721; Bible schools, 2856, with an enrollment of 116,232 pupils; and hospitals and dispensaries, 89, with a total of 22,949 in-patients and 313,248 out-patients. The field of the home mission so-

cieties included, in addition to the United States and its dependencies, Mexico, the West Indies, Central America, the Canal Zone, and South America. Their greatest activity was among the Negroes, Indians, and new Americans. The denomination maintained also six hospitals, the largest being the New England Baptist Hospital in Boston and the Northwestern Baptist Hospital in St. Paul, 20 homes for the aged, and 7 children's homes.

General headquarters of the denominational organizations are at 152 Madison Avenue, New York City, with the exception of the Home Mission Society, which is at 23 East Twenty-sixth Street, New York City, and the American Baptist Publication Society, which is at 1701 Chestnut Street, Philadelphia, Pa. The unified missionary interests of the denomination are administered by the Board of Missionary Cooperation; and the principal convention affairs are conducted by the executive and finance committees, together with some 25 other committees. Two other major boards of the denomination are the Board of Education, which cares for the work and property of the denominational schools and colleges, with assets of \$200,000,000, and the Ministers and Missionaries Benefit Board, which cares for the pension and emergency aid work for ministers, missionaries, and their dependents, with assets of \$20,000,000.

**SOUTHERN BAPTIST CONVENTION.** In the *Southern Baptist Handbook*, 1932, there were reported 18 State conventions, 23,806 churches, 22,634 ordained ministers, 211,253 baptisms during the year, 3,944,566 members, 21,004 Sunday schools, 2,952,910 Sunday school pupils, and 26,975 Baptist Young People's Unions with a membership of 546,948. Contributions totaled \$32,618,128, and church property was valued at \$217,066,775. The receipts of the boards of the convention in 1932 were as follows: Southern Baptist Foreign Mission Board (Richmond, Va.), \$805,578; Southern Baptist Home Mission Board (Atlanta, Ga.), \$458,390; Sunday School Board of the Southern Baptist Convention (Nashville, Tenn.), \$1,834,603; and Old Ministers Relief and Annuity Board (Dallas, Tex.), \$914,032.

The denomination maintained 78 schools and colleges, including five theological schools, 29 senior colleges, 24 junior colleges, and 20 academies, with a total enrollment of 29,268 students, 1601 ministerial students, and 1484 instructors; endowment amounted to \$22,410,505, and property was valued at \$38,358,133. It reported also 28 hospitals (two fostered by the Southern Baptist Convention and 26 by the State conventions), valued at \$13,880,330 and accommodating 82,894 patients during the year; 18 children's homes with a property value of \$6,098,409 and accommodating 4658 children; and three homes for the aged.

The annual session of the Southern Baptist Convention was held in St. Petersburg, Fla., May 13-16, 1932. The various boards and agencies of the convention showed still further declines in receipts for the year, bringing about a critical situation. To meet this situation still further emphasis was given to the work of the Promotion Committee of Southern Baptists, comprising 52 members and having temporary headquarters at Nashville, Tenn. The committee sponsored an "Every-Member Canvass" during Nov. 27-Dec. 4, 1932, with the objective of securing weekly subscriptions for \$40,000,000, of which amount

\$9,000,000 was to go to the support of the various missionary, educational, and benevolent enterprises of the convention, while the remainder was to care for the local work of the churches.

The following officers for the Southern Baptist Convention were elected: The Rev. F. F. Brown, D.D., of Knoxville, Tenn., president; the Rev. Arthur J. Barton, D.D., of Wilmington, N. C., the Rev. John R. Jester, D.D., of Winston-Salem, N. C., and the Rev. John W. Phillips, D.D. of Mobile, Ala., vice presidents; the Rev. Hight C. Moore, D.D., Litt.D., of Nashville, Tenn., and the Rev. Henry Burnett of Macon, Ga., recording secretaries; and the Rev. Austin Crouch, D.D., of Nashville, Tenn., executive secretary.

**NATIONAL BAPTIST CONVENTION OF AMERICA (NEGRO).** In 1932 the National Baptist Convention of America reported 1320 local associations and 52 State conventions affiliated with it either through direct messengers or representation by letter. There were 21,000 ordained ministers and a membership of 3,582,312. Of this number approximately 50,000 were added by baptism during the year. Organized Sunday schools had increased to 20,722, with an enrollment of 1,622,851 pupils. Contributions from all sources amounted to \$5,250,021. The 1932 session of the convention was held in Chicago, Ill., September 6-11. Headquarters of the National Baptist Publishing Board are at 523 Second Avenue, North, Nashville, Tenn.

**BAR ASSOCIATION, AMERICAN.** A national association, organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation and in the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The fifty-fifth annual meeting was held in Washington, D. C., Oct. 12-15, 1932, and was attended by more than 2400 delegates. Preceding the meeting there were held on October 10-11 sessions of the following sections: Criminal law and criminology; judicial; legal; education and admissions to the bar; mineral law; patent, trade-mark, and copyright law; public utility law; and also the forty-second annual conference of commissioners on uniform State laws.

Guy A. Thompson, the retiring president, in his address at the opening session entitled "The Lawyer, the Layman, and the Public Good," emphasized the importance of the part that each must play in the great task of making the administration of justice more speedy and certain and the foundations of our government more secure. President Hoover, in addressing the association at its evening session on October 12, praised the profession's contribution to "ordered liberty under law." He participated also the following day in laying the corner stone of the new building for the Supreme Court of the United States on Capitol Hill. On the latter occasion John W. Davis was spokesman on behalf of the bar of the Supreme Court and Chief Justice Charles E. Hughes on behalf of the court itself.

Judge Kimbrough Stone, in his address on "The Greatest Function of the Courts," stressed the activities of the Supreme Court in keeping inviolable the constitutional guarantees of the rights of individuals as the greatest function of that great tribunal. Atty. Gen. William D. Mitchell, in speaking on "Reform in Federal Criminal Procedure," gave an account of what

the administration had done to improve the efficiency of the judicial machinery. Hatton W. Sumner's address "Are We Observing the Natural Laws That Govern Governments?" analyzed with sturdy common sense, rare humor, and deep patriotic feeling the causes of our constant governmental failures and misadventures. Paul Reynaud, of the Paris bar, linked the bars of France and America together in their age-long struggle for the conquest of liberty and the organization of peace. The Marquis of Reading, former Lord Chief Justice of England, made the able address of a great lawyer and statesman who has seen much, has reflected much, and has played no small part in the great affairs of which he spoke.

Among the important resolutions adopted by the association was a protest against opposing confirmation of judges because of decisions based on established precedents. The association urged Congress, in further revisions of the Revenue Act of 1932, to endeavor to secure a larger proportion of the Federal revenue from forms of taxes less susceptible to sharp fluctuations than taxes on net income. The association's medal for distinguished service in the cause of American jurisprudence was awarded to John Henry Wigmore, dean emeritus of the Northwestern University law school.

The total membership of the association in 1932 was 30,000. The officers elected for 1932-33 were: Clarence E. Martin, of Martinsburg, W. Va., president; John H. Voorhees, of Sioux Falls, S. D., reelected treasurer; and William P. MacCracken, Jr., of Chicago, reelected secretary. Headquarters of the association are at 1140 North Dearborn Street, Chicago, Ill. See LAW IN 1932.

**BARBADOS**, bar-bā-dōz. A West Indian island colony of Great Britain, lying to the east of the Windward Islands, with an area of 166 square miles and a population at the census of 1921 of 156,312 (estimated Jan. 1, 1932, 173,674), or more than 1000 to the square mile. The capital is Bridgetown, with a population of 13,486. Births in 1931 numbered 4853 and deaths 4488. The 128 primary schools had 23,281 pupils registered in 1930.

The area under cultivation in 1930 was 67,682 acres, of which slightly more than half was devoted to sugar cane. Cotton is the other staple crop. The collapse of world prices of cotton and sugar resulted in severe distress in 1930 and 1931. Fishing and rum distilling are other industries. In the year 1931-32 total imports amounted to £1,488,969 and exports to £1,062,788; trade was chiefly with the United States, the United Kingdom, and Canada. Revenue for the fiscal year 1931-32 totaled £415,645; expenditure, £424,088; public debt, £663,000. A total of 1086 vessels aggregating 1,914,328 net tons entered the ports during the year 1931. A governor administers the affairs of the island with the assistance of an executive council, an executive committee, a legislative council of 9 members appointed by the King, and an assembly of 24 members elected annually by about 5200 registered electors. Governor and Commander-in-Chief, H. S. Newlands who assumed office in December, 1932.

**BARGA.** See MANCHURIA; MONGOLIA under History.

**BARLEY.** The world's barley production in 1932 made a marked recovery from the low yield of the preceding year. The production for the year of 37 countries according to estimates re-

ported by the International Institute of Agriculture was 1,390,459,000 bushels as compared with 1,165,610,000 bushels in 1931. This increase of 225,049,000 bushels was over 19 per cent above the preceding crop and 6.5 per cent greater than the average production for the five years 1926-1930. As estimated the countries listed devoted 59,026,000 acres to barley which was 2.4 per cent above the acreage in 1931 and 2.9 per cent above the average annual acreage for the five-year period. These estimates did not include the Soviet Republics, China, several of the smaller barley-producing countries of Europe, and some of the countries of the southern hemisphere. The production of the leading countries not including the United States was reported as follows: Germany 147,653,000 bushels, Spain 127,267,000 bushels, Canada 82,981,000 bushels, Rumania 82,216,000 bushels, Japan 77,744,000 bushels, Poland 70,607,000 bushels, and Czechoslovakia 69,121,000 bushels. For five years, 1926 to 1930, the U.S.S.R. produced an annual average of 271,024,000 bushels. In the crop year 1931-1932, Argentina, ranking first in barley production in the southern hemisphere, yielded 22,125,000 bushels. The Argentine barley area for the 1932-1933 crop was reported as 1,520,000 acres and the production estimated at 32,151,000 bushels.

Estimates published by the Department of Agriculture placed the barley crop of the United States in 1932 at 299,950,000 bushels as compared with 198,399,000 bushels in 1931 when the crop was greatly reduced by drought. This production was exceeded only in 1931 and 1928. The area harvested in 1932, 13,213,000 acres, was about 16 per cent greater than in 1931 and only 2 per cent below the record acreage of 1929. The increases in acreage were most marked in the West North Central and the Western States especially in North and South Dakota where in 1931 due to drought a large acreage was abandoned. The barley acreage of the United States has nearly doubled during the past ten years. The average yield of 22.7 bushels per acre was about the same as the average for the ten years 1919-1928. The production of the leading barley growing States was reported as follows: South Dakota 47,630,000 bushels, Minnesota 47,232,000 bushels, North Dakota 39,638,000 bushels, and California 39,249,000 bushels. Of the 35 States reporting barley production these States produced over half of the country's harvest. During the fiscal year ended June 30, 1932, the United States exported 5,084,000 bushels of barley, or less than half the quantity shipped abroad the preceding fiscal year.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BASEBALL.** The 1932 major league baseball season, despite the lack of ready cash shown by customers, was extremely successful and one of the most exciting in years. It was marked by the return to power of the New York Yankees, after a four-year lapse, the retirement of John McGraw, long-time manager of the New York Giants and almost legendary figure in the game, and the terrific home run pounding of Jimmy Foxx, first baseman of the Philadelphia Athletics, among other happenings. The Yankees virtually spread-eagled the field in the American League and the end of the season found them thirteen games ahead of the second-place Athletics. The Yankees, managed by Joe McCarthy and led by Babe Ruth and Lou Gehrig, two of the most devastating hit-

ters baseball has ever known, then proceeded to maul the Chicago Cubs, representatives of the National League, in four straight games to compile more records. The fourth World Series victory in 1932 was the twelfth consecutive for the Yankees and marked the third consecutive Series in which they had figured that they swept in four straight games. They had accomplished the feat in 1927 and 1928 under the management of the late Miller Huggins. The Yankees showed superiority over the Cubs at all times and the Chicago team never had a chance to display the fire and spark that had distinguished its work in the National League throughout August and September. Ruth and Gehrig were the individual stars of the series, batting with their usual vigor and making life generally miserable for the Chicago pitchers. Vernon (Lefty) Gomez, Johnny Allen, and Charley Ruffing, Yankee pitchers, were supreme.

All the interest in the pennant races was focused on the National League race, which was tight all the way, and the home run hitting of Foxx, who threatened Ruth's record of 60 in a season. Foxx eventually finished with 58. From the outset the National League race was a series of surprises. One was the complete collapse of the highly touted New York Giants, then the retirement of McGraw and the subsequent appointment of Bill Terry, the club's first baseman as manager. Then came the tight race. Pittsburgh's Pirates were always in the thick of the race, leading at the July Fourth mark, but finished second. Brooklyn's Dodgers, managed by Max Carey, were always well up, staging a determined spurt in the latter part of the season but slipping at the end and finishing third. The St. Louis Cardinals, 1931 world champions, never got started and finished tied for sixth with the Giants. The Cubs were floundering along until August 2, when Rogers Hornsby, manager, was unceremoniously deposed and Charley Grimm, the Cub's first baseman, given the post. From that moment the Cubs played excellent ball. At the end of the season the much-traded Hornsby was hired by the St. Louis Cardinals and was scheduled to play in the infield for them in 1933.

Dale Alexander, who started the season with the Detroit Tigers and wound up with the Boston Red Sox, captured the American League batting championship with an average of .367. In the National League, Frank O'Doul of the Dodgers won with .366. Mel Ott of the Giants and Chuck Klein of the fourth place Phillies tied for home run honors in the National League with 38 apiece. Lon Warneke, youthful Chicago righthander, was the best pitcher in the National League, and Lefty Grove of the Athletics and Johnny Allen of the Yankees split honors in the American league. One of the features of the year was the hitting of four home runs in one game by Lou Gehrig of the Yankees at Philadelphia, June 3, the same day that McGraw resigned. The feat had only been performed twice before, back in the dim days by Bob Lowe and Ed Delahanty.

Major League baseball felt the depression and plans were made at the end of the season to cut salaries, cut admission prices, eliminate radio broadcasting of games in the hope of attracting more customers. The attendance on all the circuits fell off a great deal and the world series was not played to capacity either at New York or Chicago. One bright spot was July 31, when the second largest crowd in the history of base-

ball, 80,285 persons watched Cleveland and Philadelphia play at the opening of the new Cleveland Municipal Stadium.

Colonel Jacob Ruppert, owner of the New York Yankees, had another winner in his New York Bears, champions of the International League and winner of the Little World Series by beating the Minneapolis Millers, pennant winners in the American Association. Chattanooga won the Southern League pennant, Beaumont won the Texas League flag. Wilkes-Barre finished first in the New York-Pennsylvania League, and Charleston topped the Middle Atlantic. Tulsa defeated Oklahoma City in the Western League play-off and in the Pacific Coast League Portland won its first pennant in 18 seasons. Greensboro beat Charlotte in the Piedmont play-off and Rock Island led Davenport in the Mississippi Valley League. The Eastern League disbanded after playing half the schedule.

In college baseball Fordham University in New York had the strongest team in the East, defeating all the other major nines mainly because of the perfect pitching of Ken Auer. Yale, topped by Fordham, won the Eastern Intercollegiate League title, beating Columbia out for that honor. Indiana University won Big Ten Conference honors in the mid-West.

**NECROLOGY.** Among those who died in the baseball world during the year were: William Wrigley, Jr., President of the Chicago Cubs of the National Baseball League; Barney Dreyfuss, president of Pittsburgh Pirates of the National Baseball League; Dan Brouthers, former member of the old Baltimore Orioles baseball team; and Bozeman Bulger, nationally known sports writer.

**BASKETBALL.** The most important 1932 event in basketball was the changing of the rules for the 1932-1933 season, with an eye to making the game more pleasing to the casual spectator and taking away the scientific that had all but usurped the game. In late years such teams as St. John's College of Brooklyn, coached by James (Buck) Freeman and College of the City of New York coached by Nat Holman, have displayed a legerdemain that was uncanny based on scientific offenses and defenses that invariably slowed up the game for the watchers. Eventually there were protests in the form of a slight falling off in attendance, and the rules makers convened. The result was a rule doing away absolutely with back court stalling by means of 10 second rule whereby the offensive team must move the ball beyond the centre line within ten seconds after getting possession of it. The other important change virtually eliminated the pivot play. According to the new rule a player may hold the ball in a pivot for only three seconds or forfeit possession of the ball.

The standard of play in the East in the latter part of the 1931-32 season was not up to the standard of other years. College of the City of New York and Princeton were the two outstanding fives with St. John's and Upsala close up. College of the City of New York won 16 of 17 games. Princeton toppled Columbia from the top of the Eastern Intercollegiate League after the Lions had ruled for two years. Princeton and Columbia finished the season tied for first place with eight victories and two defeats each. In the play-off, the Princeton sophomores vanquished Columbia, 38 to 35.

Purdue won the Big Ten title in the middle

West, displacing Northwestern. The Boiler-makers had the best team in their history, winning 11 of 12 conference games. Creighton University was supreme in the Missouri Valley Conference and the University of Kansas five had things its own way in the Big Six. The University of Georgia won the Southern Conference tournament by downing North Carolina in the final, after Kentucky and Maryland had topped the league through the season, with nine victories and one defeat each. The University of California took the honors in the Pacific Coast Conference, Baylor topped the Southwest Conference and Wyoming was best in the Rocky Mountain group.

The Henry Clothiers of Wichita, Kansas, won the National Amateur Athletic Union tournament at Kansas City for the third consecutive year.

**BASQUE PROVINCES.** The four Spanish Provinces of Guipúzcoa, Navarra, Alava, and Vizcaya (Biscay), adjoining France at the angle of the Bay of Biscay. With an area of 6794 square miles, the Basque Provinces had an estimated population of 1,193,780 on Jan. 1, 1931. The leading cities are Bilbao (153,630), San Sebastian (80,062), Victoria (37,274), and Pamplona (33,295). Sea fisheries, iron mining, and agriculture are the principal industries. For political developments in 1932, see the article on SPAIN under *History*.

**BATES COLLEGE.** A nonsectarian college for men and women in Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1932 was 698, of whom 424 were men and 274 were women. In the 1932 summer session there was a total of 262 students, of whom 135 were men, and 127, women. The faculty and administrative officers numbered 57. The permanent funds amounted to \$1,862,000; total expenditures for the fiscal year were \$309,127; and the budget involved an appropriation of \$310,320. The library contained approximately 62,338 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

**BATTLESHIPS.** See NAVAL PROGRESS.

**BAUER, LOUIS A (GRICOLA).** An American physicist, died in Washington, D. C., Apr. 12, 1932. He was born in Cincinnati, O., Jan. 26, 1865. On his graduation from the University of Cincinnati in 1888 he was appointed astronomical and magnetic computer for the U. S. Coast and Geodetic Survey. In 1893 he returned to the University of Cincinnati for graduate study. He attended also the University of Berlin, from which he received the Ph.D. degree in 1895. During 1895-96 he was instructor in mathematical physics at the University of Chicago. He was then called to the University of Cincinnati, where he was instructor in geophysics during 1896-97 and assistant professor of mathematics and mathematical physics during 1897-99. He acted also during 1896-99 as chief of the division of terrestrial magnetism of the Maryland Geological Survey. After 1899 he was lecturer in terrestrial magnetism at Johns Hopkins University. He served as chief of the terrestrial magnetism division of the U. S. Coast and Geodetic Survey from 1899 to 1906, and held the same position with the Carnegie Institution of Washington from 1904 until his retirement in 1929. In the latter capacity he directed the various expeditions made during 1909-29 by the institution's non-magnetic ship *Carnegie* in a

world-wide survey of the earth's magnetic field.

During the World War Dr. Bauer was chairman of the committee on navigation and nautical instruments of the Council of National Defense, and continued after the war as a member of the National Research Council. As U. S. delegate he attended various European meetings of the International Research Council and the International Geodetic and Geophysical Union, being president of the latter during 1927-30. He served also as chairman of the American Geophysical Union during 1922-24. In 1905 he received from the Royal Academy of Sciences, Letters, and Arts of Belgium the Charles Lagrange prize. He was made a commander (2d class) of the Order of St. Olav of Norway, and was a fellow of the American Association for the Advancement of Science, the American Academy of Arts and Sciences, and the American Geographical Society. He was also founder and editor, from 1896 to 1928, of *Terrestrial Magnetism and Atmospheric Electricity*. His works include: *Beiträge zur Kenntnis des Wesens der Sacularvariation des Erdmagnetismus* (1895); *Vertical Earth-Air Electric Currents* (1897); *United States Magnetic Table and Magnetic Charts for 1905* (1908); and *Land-Magnetic Observations, 1905-10* (1913).

**BAUER, MARIUS ALEXANDER JACQUES.** A Dutch etcher and oil and water-color painter, died in Amsterdam July 18, 1932. He was born at The Hague Jan. 25, 1864, and received his education in art at the Academy there. All his work showed originality and vigor, but he won special fame as an etcher, being proclaimed the greatest and most individual Dutch etcher since Rembrandt. The subjects of his etchings were mostly scenes of Oriental life, based on his travels in Turkey, Egypt, and India. Among these are: "Procession"; "Queen of Sheba"; "Aladdin"; "Ali Baba"; "Morning on the Ganges"; and "The Persian Feast." He illustrated also the *Arabian Nights* and romantic literature of the East by various European authors.

**BAVARIA.** A constituent state of the German Republic; formerly a kingdom within the German Empire. Area, 29,334 square miles (excluding the Saar); population (1925), 7,379,594. Chief cities: Munich, the capital, had a population of 685,036 in 1925; Nuremberg, 393,202; Augsburg, 165,522; Ludwigshafen, 101,869. In 1930, births numbered 149,008, deaths, 92,221; marriages, 61,187. Education is compulsory between the ages of 6 and 16. The public elementary schools in 1930 numbered 7740 with 842,188 pupils.

Agriculture and mining are the chief industries. About one-half the total area is under cultivation, the principal crops in 1930 with yields in metric tons were: wheat, 541,812; rye, 681,950; oats, 595,638; barley, 595,370; potatoes, 6,143,027. The wine yield was 17,671,038 gallons. The mineral output in metric tons was: Coal, 2,202,276; iron ore, 575,773; pig iron, 290,650; cast iron, 164,348; sulphuric acid, 304,067.

The Diet (Landtag), following the election of May 20, 1928, was constituted as follows: Bavarian People's party, 46; Social Democrats, 34; National Socialists, 9; German Nationalists, 13; Bavarian Peasants' and Middle-Class Union, 17; German People's party, 4; Communists, 5. Premier, Dr. H. Held (Bavarian People's party). See GERMANY under *History* for 1932 elections.

**BAYREUTH-WAGNER FESTIVAL.** See MUSIC.

**BAZIN, bâ'zân', RENÉ FRANÇOIS NICOLAS MARIE.** A French novelist, died in Paris, July 20, 1932. Born in Angers, Dec. 26, 1853, he studied law in Paris and in 1878 became professor of criminal law at the Catholic University of Angers. As a novelist he won fame for his stories laudatory of provincial life and the domestic virtues. These include: *Stéphanette* (1884); *Une Tache d'encre* (1888, crowned by the French Academy); *Les Noëlets* (1890); *Madame Corentine* (1893); *Humble amour* (1894); *De toute son Ame* (1897); *La Terre qui meurt* (1899); *Les Oberlés* (1901); *Donatienne* (1903); *L'Isolé* (1905); *Le Blé qui lève* (1907); *La Closerie de Champdolent* (1917); *Les nouveaux Oberlés* (1919); *Le conte du triolet* (1924). He is best known to English and American readers by *Les Italiens d'aujourd'hui* (1894; Eng. trans., 1904), a careful and sympathetic study. Among his other travel books are *L'Aventure* (1891); *Stoile* (1893, crowned by the French Academy); *Terre d'Espagne* (1895); and *Croquis de France et d'Orient* (1901). *Fils de l'église* (1927) is a history of the Roman Catholic Church. In 1903 he was elected to the French Academy. He was also an officer of the Legion of Honor.

**BEAUX-ARTS INSTITUTE OF DESIGN.** A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris. It was organized in 1916 by the Society of Beaux-Arts Architects for the purpose of furnishing "instruction in the arts, under the Regents of the State of New York, at a minimum cost to students, to bring art students under the criticism of artists who are engaged in active practice, to carry students beyond the academic study of the arts into the province of their application and practice, and to bring about coöperation among the various art schools of the country." Working under the auspices of the institute during the year 1931-32 were 2500 architectural students, 160 students of sculpture, and 114 students of mural painting.

Prizes in architecture, sculpture, and mural painting are offered to students throughout the United States. During the year 1931-32, the committee on education in the department of architecture conducted 36 competitions for the study of architecture and six for the study of archaeology. The most important of the various prizes and scholarships offered to students through the institute is the Paris Prize amounting to \$3600, given by the Society of Beaux-Arts Architects, which affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. There is also the Paris Prize in Sculpture, representing a scholarship of \$1200 for one year's study in Paris.

The institute issues a monthly *Bulletin*. The officers elected at the annual meeting in November, 1932, were: Director, Whitney Warren; secretary, Henry R. Sedgwick; director of architectural department, Ely Jacques Kahn; director of department of sculpture, Edward McCartan; director of department of mural painting, Hildreth Meiere; chairman of the board of trustees, Benjamin W. Morris; vice chairman, William Adams Delano. Headquarters are at 304 East Forty-fourth Street, New York City.

**BECHUANALAND PROTECTORATE,** bëch'öö-ä'-ná-länd'. A British protectorate in South Africa. Area, about 275,000 square miles;

population (census of 1921), 152,983, including 1743 Europeans. Cattle rearing and primitive agriculture are the chief occupations. Gold and silver mined in 1930-31 was valued at £8414. Revenue in 1930-31 amounted to £148,511; expenditure to £154,922. The colony is administered through the native chiefs by a resident commissioner under the High Commissioner for South Africa. Resident Commissioner in 1932, Lieut.-Col. C. F. Rey.

**BEECHAM, SIR THOMAS.** See MUSIC.

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIUM.** A kingdom of Western Europe, situated between France and the Netherlands. Capital, Brussels; reigning monarch since 1909, Albert I.

**AREA, POPULATION, ETC.** The total area, including the districts of Eupen and Malmédy, which were ceded to Belgium by the Treaty of Versailles, is 11,755 square miles. According to the census of Dec. 31, 1930, the total population was 8,092,004, as compared with 7,465,782 at the census of Dec. 31, 1920. The movement of population in 1930 was: Births, 151,406 (146,206 in 1929); deaths, 107,468 (120,782); excess of births over deaths, 43,938 (25,424); marriages, 71,624 (71,811); emigration, 29,567 (29,161); immigration, 54,409 (55,595). Of the 1930 emigration 25,939 went to European countries and 3618 to other than European countries. Foreigners in Belgium in 1930 included 12,749 Germans, 70,201 French, 64,079 Dutch, 11,532 British, 48,840 Polish, and 34,890 Italians; total foreign population, 316,982 (149,677 in 1920). The estimated populations of the leading cities on Dec. 31, 1930, were: Brussels (with suburbs), 839,581; Antwerp (Anvers), 294,902; Ghent (Gand), 169,322; Liège (Lüttich), 166,820.

**EDUCATION.** On Dec. 31, 1930, there were 871,172 pupils in 8504 primary schools, 248,936 pupils in 3928 infant schools, 40,969 pupils in 1449 elementary adult schools, 48,373 pupils in 221 secondary schools of various descriptions, and 10,364 students in the four Universities at Brussels, Louvain, Ghent, and Liège. Ghent and Liège are state universities. The Ghent institution became a Flemish university in October, 1930.

**PRODUCTION.** Agriculture, mining, and manufacturing are equally important factors in the national economy, enabling Belgium to support one of the densest populations in Europe. Considerable foodstuff is imported. Arable land in 1930 totaled 3,044,000 acres, or 40 per cent of the total area; permanent meadows and pastures, 1,314,000 acres; orchards, 168,000 acres. Livestock in the same year included 1,759,000 cattle, 1,250,000 swine, and 246,000 horses employed in agriculture. Production of the chief crops is shown in the accompanying table.

There were 155,054 workmen employed in the mining and metallurgical industries in 1931. The output of these industries for the year, in metric tons, with 1930 figures in parentheses, was: Coal, 27,035,270 (27,405,560); briquettes, 1,850,330 (1,875,040); coke, 4,931,060 (5,364,000); pig iron, 3,231,580 (3,393,540); wrought iron, 62,880 (122,370); steel, 3,056,450 (3,270,680); wrought steel, 2,350,600 (2,793,060); crude zinc,

## BELGIUM'S CROPS: AREA AND PRODUCTION

<sup>a</sup> Thousands of acres. <sup>b</sup> Thousands of units—bushels except as indicated. <sup>c</sup> Unit, metric ton. <sup>d</sup> Seasons ended following year. <sup>e</sup> Unit, pound.

205,144 (in 1930). The above figures are provisional. Sugar refining, distilling, brewing, and the manufacture of margarine, vinegar, matches, glass, artificial silk, motor-cars, and lace are other leading industries. Belgian industry was seriously depressed in 1932, the number of unemployed totaling 352,000 at the end of May, compared with 167,000 on June 30, 1931.

**COMMERCE.** The foreign trade of Belgium and Luxemburg, which are united in a Customs union, continued to decline during 1931 and 1932. Imports fell to 23,741,944,000 paper francs in 1931 from 30,921,749,000 in 1930, while exports declined to 23,126,479,000 paper francs from 26,249,045,000 in 1930 (paper franc equalled \$0.0278 at par). The 1931 imports were divided by value of main commodity classes as follows: Raw materials, 10,858,148,000 francs; manufactures, 7,095,781,000 francs; foodstuffs and beverages, 5,670,625,000 francs. Exports comprised: Manufactures, 13,009,596,000 francs; raw materials, 7,887,870,000 francs; foodstuffs and beverages, 2,015,205,000 francs.

**FINANCE.** Results of budget operations since 1926, together with the estimates for 1931 and 1932, are shown in the accompanying table from *Commerce Reports*, June 27, 1932.

## BELGIAN BUDGET RESULTS [In millions of francs, par value = \$0.0278]

Year	Revenues (excluding loans)	Expenditures	Surplus (+) or deficit (-)	Proceeds of funded loans
1926 . . . . .	11,476	15,395	-8,919	8,744 <sup>a</sup>
1927 . . . . .	10,695	9,286	+1,409	442
1928 . . . . .	12,141	10,747	+1,394	807
1929 . . . . .	13,595	12,281	+1,314	181
1930 (preliminary) . . . . .	11,137	13,072	-1,935	741
1931 (estimates) . . . . .	11,635	12,647	-1,012	1,185
1932 (proposed) . . . . .	10,887	11,144	-257	( <sup>b</sup> )

<sup>a</sup> Including stabilization loan.

<sup>b</sup> A 2,000,000,000-franc loan was authorized.

The 1932 budget proposals anticipated an increase in tax receipts of 600,000,000 francs over the estimated receipts for 1931, due to higher tax rates imposed in July, 1931. General reductions in expenditure were provided for, particularly in the national defense and public works items. Provisional returns indicated a deficit for the year of 2,260,000,000 francs, as compared with a deficit of 1,523,000,000 francs in 1931.

The public debt on Sept. 30, 1931, stood at 52,384,000,000 francs (about \$1,456,275,000), as compared with 51,968,000,000 francs (about \$1,445,000,000) on Sept. 30, 1930. Of the total in 1931, 51,614,000,000 francs represented the funded debt (internal, 25,891,000,000; external,

25,723,000,000) and 770,000,000 francs the short-term internal debt.

**COMMUNICATIONS.** The Belgian system of interior communications in 1932 comprised 3168 miles of standard-gauge railways, 2876 miles of narrow-gauge, 282 miles of tramways, 1035 miles of navigable waterways, and 3726 miles of bus lines. In addition, there were about 497 miles of airways operated by Sabena, the Belgian commercial air-navigation company. In 1931 the Superior Council of Transports was established to study the coördination of these various services. Most of the railways are state owned, but since 1926 have been operated by a private company. Total railway receipts in 1931 were 3,085,200,000 francs and expenditures 3,022,200,000 francs. The Sabena company was scheduled to open an air service between Antwerp, Brussels, and the Belgian Congo commencing Oct. 1, 1932.

**GOVERNMENT.** Belgium is a constitutional, representative, and hereditary monarchy. Executive power is in the King, acting through a responsible ministry; legislative power is in the King and two chambers, namely, the Senate and House of Representatives. The former is elected partly by direct and partly by indirect vote of the people, the number being proportioned to the population of each Province. Those elected indirectly are chosen by the provincial councils. Following the election of May 26, 1929, the composition of the Senate was: Catholics, 71; Socialists, 56; Liberals, 23; Frontists, 4. The Chamber of Deputies was composed as follows: Catholics, 77; Socialists, 70; Liberals, 28; Frontists (Flemish autonomist party), 11; Communists, 1. The Ministry, as reorganized June 5, 1931, represented a coalition of the Catholic, Liberal, and Christian Democratic parties. Its leading members were: Prime Minister and Minister of Finance, Jules Renkin (Catholic); Foreign Affairs, Paul Hymans (Liberal); Justice, Fernand Cocq (Liberal).

### HISTORY

**THE LANGUAGE DISPUTE.** The bitter language dispute between French- and Flemish-speaking Belgians was again the chief political issue before Parliament. After an extended controversy, involving the reorganization of the Renkin Cabinet, a law settling the problem at least temporarily was passed by Parliament on July 18. It provided that the official language and that of instruction in the schools should be Flemish exclusively in Flemish-speaking Provinces and French exclusively in the Walloon Provinces. The region of Greater Brussels and the German-speaking districts of Eupen and Malmédy were excepted from the application of the law. The measure made a second language obligatory in secondary schools and provided that elements of a second language might be taught in primary schools. It was recognized, however, that its effect would be to eliminate the French language from Flanders, where it had been employed by officials, the upper classes, and in the schools for generations.

The measure as enacted was substantially the same as that presented before the Chamber on January 20 by the Government, and passed by the Chamber on March 2. In the Senate, however, strong opposition developed to the complete subordination of French to Flemish in Flemish Provinces. Embarrassed by the uncompromising stand of the Flemish Democrats, which made it

difficult for the ministry to keep its promises to the French-speaking section of the Liberals, Prime Minister Renkin and his colleagues resigned on May 17 without waiting for an adverse vote. On May 23 M. Renkin formed a new cabinet, which included only three new ministers, and resumed negotiations, with eventual success. The three new ministers represented the Liberal, Christian Democrat, and Flemish Right parties, respectively. The Prime Minister on May 25 pledged his administration to a linguistic settlement that would satisfy all parties as well as to a programme of financial rehabilitation, peace, and disarmament with security.

**FINANCIAL AND TARIFF MEASURES.** Earlier in the year the Government found itself in difficulty over the prospective deficit in the 1932 budget of 1,200,000,000 francs (about \$33,000,000) due to the deepening of the economic depression. The Prime Minister took over the Finance portfolio from Baron Houtart and on March 17 secured the adoption of a finance reform measure under which all budgetary expenses were reduced 10 to 15 per cent—a saving of \$18,210,000—and taxes increased in the same ratio, yielding an additional \$15,123,000. Despite this balancing of the budget, the prospect of financial emergencies caused the Renkin Government to ask for special powers during the Parliamentary recess commencing July 20. The party leaders, however, refused to surrender their prerogatives and it was decided to call Parliament in special session.

The Chamber, in special session, approved (September 7) the issuance of a \$42,000,000 long-term loan and authorized the Government to issue Treasury bonds equivalent to \$1,400,000, renew \$1,000,000 of Treasury bonds maturing October 1, and float another foreign loan to re-equip the state telegraph and telephone service. The Socialists opposed the latter project, calling for a referendum by the country. The Renkin Cabinet was forced to resign in October and Count Charles de Broqueville on October 22 formed a coalition ministry of Catholics and Liberals to hold office pending new elections.

In March, Parliament confirmed the higher tariff schedule placed in operation three months earlier on various imports, particularly on foodstuffs. On June 20, the Government reversed this tendency by signing with the Netherlands and Luxemburg one of the first tariff-reduction treaties in tariff-ridden Europe. The treaty pledged the three countries to impose no new duties upon each others' goods and to lower existing rates 10 per cent annually until a certain level had been reached. The agreement frankly abandoned most-favored-nation treatment, but was open to adhesion by any other state. Belgium's participation was attributed partly to resentment at the French quota system, which had seriously restricted Belgian exports to that country.

**THE ELECTIONS.** National elections were held November 27 to fill 96 seats out of the 154 in the Senate and all of the 187 seats in the Lower Chamber. Both Catholics and Socialists gained at the expense of the Liberals, who lost four seats in the Chamber. The Frontist party, standing for the autonomy of Flanders, lost three seats, while the Communists gained two. However the balance of power was unchanged by the election and the Catholic-Liberal coalition remained in office, controlling 103 votes in the Chamber against 84 for the Opposition.

**CABINET AND DEBT CRISIS.** There was much dissatisfaction among the Liberals at their losses in the election, which they attributed in part to their collaboration with the Catholics. Accordingly, the early resignation of the Broqueville Cabinet was predicted. The expected resignation occurred on December 13, the Cabinet seizing upon its refusal to meet the December 15 war-debt payment due the United States government as a favorable issue on which to hang its withdrawal. On November, 10, 11, and 15, the Belgian government dispatched notes or memoranda to Washington urging "a reëxamination of the problems arising from the inter-governmental debts." Informed that Washington expected the December 15 payment of \$2,125,000 to be made, the Cabinet on the 13th drafted a note announcing its intention to default but offering its collaboration in "seeking a general settlement of inter-governmental debts and of the other problems arising from the depression." The default was defended on the ground that Belgium, by accepting the Hoover moratorium of 1931 and the Lausanne agreement of 1932 (see REPARATIONS AND WAR DEBTS), had "sacrificed a credit which was guaranteed to her by the most solemn engagements, and which constituted an essential element for the balancing of her public finances. This sacrifice . . . , added to the effects of the general paralysis of economic activity, has brought (Belgium) face to face with the most serious financial difficulties."

The King asked Count de Broqueville to form a new Cabinet and on December 17 the latter presented the following list, representing another Catholic-Liberal coalition: Premier, Count Charles de Broqueville; Foreign Affairs, Paul Hymans; Finance, Henri Jasper; Interior, Prosper Poullet; Defense, Albert de Veze; Social Welfare and Health, Carton de Wiart; Labor, Philippe van Isacker. MM. Hymans, Jasper, and Poullet were holdovers. On December 23, the Cabinet received a vote of confidence, 100 votes to 80. For the remainder of the year, the ministry was engaged mainly in plans for balancing the 1933 budget. On December 26, it announced a project for effecting a saving of \$12,000,000 by reducing the salaries of officials and military and old-age pensions.

**OTHER DEVELOPMENTS.** Proposals for compensating the National Bank for its losses due to the depreciation of sterling in 1931 and for revision of the so-called "blue laws" preventing the sale of strong alcoholic beverages in hotels, cafés, and restaurants were considered by Parliament during the year. The Government was confronted with serious disorders arising from an extensive strike, which started in Borinage coal region on May 31 and quickly spread to the glass, cement, metallurgical and other industries. After Belgian and foreign Communists had intervened in the struggle, rioting, and the erection of street barricades led to the calling out of regular army regiments and the declaration of martial law. Scores of police and strikers were injured and King Albert hurriedly returned from a vacation in Switzerland. A settlement was finally reached September 7. Within the preceding year, wages were said to have been reduced 30 to 35 per cent in the coal industry and unemployment had increased notably. After an investigation into Communist activities during the strike, the Government expelled several foreign Communists,

including a deputy of the Czechoslovak Parliament, from the country.

Attacks upon the American Congress and President Hoover because of the refusal of Congress to authorize cancellation or reduction of the war debts reached such a height early in the year that Ambassador Hugh S. Gibson protested on behalf of the U. S. Government to the Belgian Foreign Minister. The Foreign Minister apologized.

A law liberalizing the Belgian civil code with regard to the status of married women was passed by Parliament during the year.

See NETHERLANDS, THE, under *History*.

**BELIZE.** See BRITISH HONDURAS.

**BENDIX TROPHY RACE.** See AERONAUTICS.

**BENJAMIN, MARCUS.** An American editor, died in Washington, D. C., Oct. 22, 1932. He was born in San Francisco, Calif., Jan. 17, 1857. Upon his graduation from the Columbia University school of mines in 1878, he followed his profession of chemist for several years, acting as editor of the *American Pharmacist* and its successor, the *Weekly Drug News*, and as lecturer on chemistry at the New York Women's Medical College. In 1889 he received the Ph.D. degree from the University of Nashville. He became editor of the publications of the United States National Museum in 1896, which position he held until his retirement in 1931. He served also on the staffs of *Appleton's Cyclopædia of American Biography*, the *Standard Dictionary*, the *Universal Cyclopædia*, the *Encyclopædic Dictionary*, and the *NEW INTERNATIONAL ENCYCLOPEDIA*, and was a contributor to *Appleton's Annual Cyclopædia* from 1883 to 1902 and to the *NEW INTERNATIONAL YEAR BOOK* from 1907 to 1932, having completed his labors for the present issue of the *YEAR BOOK* a few days before his death. In 1910 he acted as editor-in-chief of *Appleton's New Practical Cyclopædia* (6 vols.), and was editor of various Appleton's guides and hand-books. He was also at different periods a member of the annual United States Essay Commission. During the World War he was an aide in the office of the Naval Intelligence and received the decoration of Officer of Public Instruction (with palms) from France in 1920 and that of Officer of the Crown from Italy in 1927. After 1911 he was a member of the council of the Washington Protestant Episcopal Cathedral. He wrote extensively in biography, especially of scientific men and churchmen, and in history and social science, and all his work was characterized by the care of the expert and proved valuable contributions to science and scholarship. Among his biographical studies a monograph on *John Henry Boner*, poet, editor, and essayist, ranks high.

**BENNETT BALLOON RACE.** See AERONAUTICS.

**BENSON, REAR ADMIRAL WILLIAM SHEPHERD, U. S. N., RET.** An American naval officer, died in Washington, D. C., May 20, 1932. He was born in Macon, Ga., Sept. 25, 1855, and was graduated from the U. S. Naval Academy in 1877. In 1881 he was made ensign, one of his first assignments being to the *Constitution*, on which he participated in the last voyage ever made by that historic vessel. In 1900 he was commissioned lieutenant-commander and the following year was appointed senior assistant to the commander of the U. S. Naval Academy. In 1907 he was made commandant. In 1909 he became chief of

staff of the Pacific fleet, with the rank of captain, and during 1913-15 served as commandant of the Philadelphia navy yard. He was then called to Washington as first chief of naval operations and was raised to the rank of rear admiral. During his incumbency of this office he developed the aviation and submarine branches of the navy and effected many improvements in target practice and manœuvres.

In 1917 Admiral Benson was a member of the commission appointed by President Wilson to confer with the Allies in Paris. At this conference he consented to help strengthen the British blockade by sending several divisions of the U. S. battleship fleet to join the British grand fleet in the North Sea. He served as U. S. naval representative in drawing up the naval terms of the armistice and was naval adviser to the American commission at the Peace Conference in Paris. On his retirement in 1919 he was appointed a member of the U. S. Shipping Board, being later elected chairman. On the reorganization of the board, during the Harding administration, he was made one of seven commissioners, and in 1922 was reappointed for a term of six years. He received the Distinguished Service Medal at the close of the War and also several foreign honors, including the grand cross of the French Legion of Honor; grand cross of the British Order of St. Michael and St. George; the Japanese Order of the Rising Sun, 1st class; and the Papal Order of St. Gregory the Great (military class, 1st order).

**REQUESTS FOR EDUCATION.** See UNIVERSITIES AND COLLEGES.

**BEREA COLLEGE.** A nonsectarian, coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1932 was 1535, distributed as follows: College, 632; academy, 549; foundation-junior high school, 318; nurses, 36. The enrollment in the summer session of 1932 was 373, of whom 229 were in the college, 120 in the academy, and 24 were nurses. The faculty numbered 108. The endowment amounted to \$9,316,226, and the income for the year ending June 15, 1932, was \$543,880. The library contained about 63,000 volumes. The college of arts and sciences is enriching its curriculum by the extension of the work in the Fine Arts to a full department, and by the addition of theory and practical work in music, making possible music majors in Piano, Violin, Voice, Pipe Organ, and Public School Music. President, William J. Hutchins, D.D., LL.D.

**BERLIN PHILHARMONIC ORCHESTRA.** See MUSIC.

**BERMUDA.** A British colony in the North Atlantic Ocean (32° 15' N. latitude and 64° 51' W. longitude) about 580 miles east of Cape Hatteras, N. C., consisting of a group of 360 small islands. About 20 of the islands are inhabited. Because of its picturesqueness, warm climate, and proximity to New York (677 miles), it is a favorite resort for American tourists. Area, 19.3 square miles; population (census of 1931), 27,789, including 11,353 white. The chief town, Hamilton (population 3000) is an important naval base. Radio-telephone service between the United States and Bermuda was opened Dec. 21, 1931.

Primary schools receiving Government aid numbered 32 in 1930, with 3782 pupils. Potatoes,

onions, lily bulbs, and other vegetables are cultivated for the United States, and Canadian market. Imports in 1931 were valued at £2,463,259 and exports at £119,005. Imports from the United States in 1930 were valued at \$4,700,000 and exports to that country at \$700,000. Revenue in 1931 amounted to £464,351; expenditure, £458,700; public debt, £131,636. The tonnage of vessels entered and cleared, in 1931, aggregated 7,476,497 tons. The Government is administered by a governor, assisted by an executive council of 7 members and a legislative council of 9 members, both appointed by the Crown and an assembly of 36 members chosen by 1523 electors. Governor in 1932, Lieut.-Gen. Sir T. A. Cubitt.

**BES'SARABIA,** *bēs'sā-rā'bl-ā.* A former province of the Russian Empire, joined on Apr. 11, 1918, to Rumania, whose title was confirmed by the Peace Treaties of 1919, but had never been conceded by the government of the Soviet Union. Area, 17,146 square miles; population (provisional 1930 census), 2,865,506. See RUMANIA.

**BIBLE SOCIETY, AMERICAN.** Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment." This service is rendered without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without purpose of profit, and below cost or donated free when circumstances justify. The work in the United States is carried on through 10 home agencies and some 100 auxiliary, State, and local Bible societies. Twelve additional agencies cover all Latin America and countries in the Near East and the Far East, correspondents helping the work in other countries, especially in Europe and Africa.

During 1931 the society issued 9,745,356 volumes in 182 languages. Engaged in this work were agency secretaries, sub-agents, colporteurs, correspondents, and volunteers, totaling 4145. The number of volumes issued in the United States by 1715 persons was 4,527,776, and in foreign lands by 2430 persons was 5,217,580. During the 116 years of its existence the society has issued 237,979,404 volumes of Scriptures and participated in the translation, publication, and distribution of the Scriptures in more than 300 languages, dialects, and versions.

In translation work during 1931 two languages received for the first time a portion of the Scriptures—the Miao of Siam and the Yao of Siam. The Cakchiquel Indians of Guatemala received for the first time the entire New Testament in their own tongue; the revision of the Turkish New Testament was marked by the publication of the three Gospels—St. Mark, St. Luke, and St. John—and the Acts of the Apostles; in the Sulu dialect of Moro, Philippine Islands, St. Luke's Gospel, revised, became the sole available Scripture in that dialect. Four new translations were received and were being examined before publication: St. Mark in Shilluk (Sudan), St. Matthew in Keres (American Indian), St. John in Valiente (Panama Indian), and St. Matthew and St. Mark in Otetela (Belgian Congo). In 12 other languages new translation or revision work was in process or texts were being examined preparatory to publication.

The budget of the society for 1931 was \$1,180,248. The officers were: J. Frederick Talcott, president; E. Francis Hyde, president emeritus; the Rev. Eric M. North, Ph.D., D.D., and the Rev. George William Brown, M.A., general secreta-

ries; the Rev. Lewis B. Chamberlain, D.D., recording secretary; Gilbert Darlington, treasurer; and Charles W. Fowle, assistant secretary.

**BIBLIOGRAPHY.** See PHILOLOGY, MODERN. **BICYCLING.** See CYCLING.

**BIGOURDAN**, Guillaume. A French astronomer, died in Paris, Feb. 29, 1932. He was born in Sistels, Apr. 6, 1851, and attended the Institut Lacan-Rebouis in Valence-d'Agén. After serving for 20 years as assistant astronomer at the Toulouse Observatory he became, in 1897, astronomer at the Paris Observatory where he distinguished himself through his observations of nebulae, the position of the stars, and the course of the comets. In 1919, on the organization of the International Time Bureau in Brussels, he was made director. He was a member of the Academy of Sciences, being chosen three times laureate by that body. He served also as president of the Bureau of Longitudes and was a chevalier of the Legion of Honor. Among his works are: *L'Équation personnelle dans les mesures d'étoiles doubles* (1886); *Observations de nébuleuses et d'amas stellaires* (4 vols., 1901); *Le Système métrique des poids et mesures* (1901); *Les Annales célestes de Pingré* (1901); and *L'Éclipse du soleil* (1905). He was a contributor to the *Annales de l'Observatoire*, the *Bulletin astronomique*, and the *Comptes rendus* of the Academy of Sciences.

**BILLIARDS.** Ralph Greenleaf, one-time "boy wonder" of Monmouth, Ill., was the leading figure in professional billiards in 1932. Professional balkline players were inactive because of the inability of the authorities to import enough foreign talent for a championship tournament for Jake Schaefer's 18.2 title, so the limelight rested on Greenleaf, who won his eleventh national pocket billiards tournament at New York in December. Greenleaf successfully defended his crown by going through the two arduous weeks of tournament play without a defeat. Jimmy Caras, a youngster from Wilmington, Del. finished second, Erwin Rudolph third, and Andrew Ponzi fourth. Greenleaf dominated the tournament by his string of victories and his high run of the tournament of 106, but best game honors went to Ponzi who turned in a four-inning and a six-inning game.

The veteran August Kieckhefer of Chicago won the world's professional three cushion tournament held at Chicago in February, displacing Arthur Thurnblad as champion. Otto Reisel finished second, Thurnblad third, and Johnny Layton, 1930 champion, fourth.

The amateur campaign was featured by the world's 18.2 balkline tournament held in New York in the spring. Nine of the premier cue artists of the world were entered and Albert Poensgen of Germany retained his title after a playoff with Gustave Van Belle of Belgium. Edmund Soussa of Egypt was third and Albert Corty of France fourth. The world's amateur three-cushion championship held in Paris resulted in a victory for A. Robyns of Holland with Puigvert of Spain, second. Edward N. Lee, United States champion, was eliminated in the early rounds. Percy N. Collins, of Chicago won the national 18.2 balkline championship but later bowed to Edgar T. Appleby of New York in a challenge match.

Three men held the national amateur pocket billiard title during the year, the last being J. Howard Shoemaker of New York, who took

the crown from Vaino Korhonen, also of New York, who had taken it from Edward Fagen, of Bayside, L. I. In three-cushion play Edward N. Lee successfully defended his national amateur title, defeating Charles D. Gill, 150 to 94. Orlando C. Bennett won the national amateur 14.2 balkline tournament after a playoff with James Langdon. The national snooker title was taken by Charles Shongood Jr., and Jerome Strauss, a class B player, won the annual Poggenburg Memorial Cup tournament—handicap event for all classes of amateur players. Late in the year a formal tournament for women pocket billiards players was held in New York. Mrs. Gertrude Baker McAvoy, of Bayside won, defeating Miss Georgia Veatch, of Chicago, 200 to 198.

**BILLINGS, FRANK.** An American physician, died in Chicago, Sept. 20, 1932. He was born in Highland, Iowa Co., Wis., Apr. 2, 1854, and was graduated from the Northwestern University medical school in 1881. After serving his internship at Cook County Hospital he took post-graduate work in Vienna, London, and Paris during 1885-86. He was appointed professor of physical diagnosis at the Northwestern University medical school in 1886 and professor of medicine in 1891. In 1898 he was called to the Rush Medical College in Chicago as professor of medicine, and after 1900 was dean of the faculty of that institution. He was also from 1905 to 1924 professor of medicine at the University of Chicago. During the World War he served with the American Expeditionary Force in the office of the provost marshal general and of the surgeon general, and in 1917 was chairman of the American Red Cross mission to Russia. He was president of the American Medical Association during 1902-04, of the Association of American Physicians in 1906, of the National Association for the Study and Prevention of Tuberculosis in 1907, and of the Illinois State Board of Charities and of the State Charities Commission during 1906-12. Among his works are *Focal Infection* (Lane medical lectures at Stanford University, 1916).

**BIRMINGHAM-SOUTHERN COLLEGE.** A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1932 was 818 full-time students, and 308 part-time students, and for the summer session 458. There were 54 faculty members. The endowment amounted to \$722,438, and the income for the year was \$285,695. There were 30,000 volumes in the library. During the year, the College became the beneficiary of bequests of the late R. S. Ruter and Angeline G. Ruter to the extent of approximately \$50,000. President, Guy Everett Snively, Ph.D., LL.D.

**BIRTH RATES.** See FRANCE, GERMANY, GREAT BRITAIN, SPAIN, ITALY, and JAPAN and the other principal countries under *Area and Population*; VITAL STATISTICS.

**BISMARCK ARCHIPELAGO.** See NEW GUINEA.

**BLAIR, ANDREW ALEXANDER.** An American chemist, died in Philadelphia, Pa., Jan. 25, 1932. He was born in Woodford Co., Ky., Sept. 20, 1848, and attended the U. S. Naval Academy, from which he was graduated in 1866. He served a few years as ensign in the Navy, but after 1870 devoted himself to analytical chemistry. From 1875 to 1878 he was employed in testing iron and steel for the U. S. Government at the Watertown Arsenal, and from 1879 to 1881 acted as chief chemist to the U. S. Geological Survey and the Tenth Census. He then became engaged in general practice, devoting himself to improvement in the methods of technical analysis. At the time of his death he was senior partner in the firm of Booth, Garrett & Blair, analytical chemists of Philadelphia. In addition to a number of papers and reports on various special subjects of metallurgy, he wrote *The Chemical Analysis of Iron* (1888).

**BOHEMIA.** The largest and most populous Province of Czechoslovakia; formerly a crown-land of Austria; situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czechoslovakia, 20,102 square miles; population on Dec. 1, 1930 (preliminary census), 7,106,766. Bohemia is represented in the Czechoslovak Legislature by nine Deputies and five Senators. See CZECHOSLOVAKIA.

**BOILERS.** The number of stationary steam boilers for power purposes sold in the United States during the first eleven months of 1932, according to the Department of Commerce, was 3350, as compared with 7118 for the corresponding period of 1931. In terms of square feet of heating surface these were, respectively, 3,218,259 and 5,956,022.

An outstanding trend was the increasing number of boilers with fusion-welded drums which practice is now rapidly displacing riveted construction. The extension of this practice followed closely upon the sanction of fusion welding for fired pressure vessels by the Boiler Code Committee of the American Society of Mechanical Engineers during the summer of 1931.

Among new stationary installations steam pressures remained about as heretofore, although no new 1200 to 1400 pound plants were projected. Steam temperatures, however, increased from 750 to 825 or 850 degrees F. One unit has been in service at the Delray Station in Detroit for more than a year at 1000 degrees. Stainless steel has been employed for superheater tubes in some of these new boilers.

More boilers were equipped for stoker firing during the year than for pulverized coal and in certain sections there was a marked trend toward oil firing because of the favorable oil prices resulting from excess production in some of the oil fields. In other sections, served by natural gas pipe lines, many boilers were changed from coal to gas. Also, there was an increase in the number of installations using combination fuels.

During the year eight boiler units were placed in service at the Hudson Avenue Station of the Brooklyn Edison Company. In many respects this installation is outstanding. Per square foot of floor space these boilers serve more than three times the turbine capacity served by the earlier boilers in this station. Each has a capacity of

530,000 pounds of steam per hour and they are fired by the World's largest stokers—26 feet 8 inches long by 26 feet wide. An idea of the magnitude of this installation may be had from the fact that the forced and induced-draft fans serving these eight boilers required nearly 20,000 horse power in motor capacity. Of course, individual boiler units of twice this capacity have been in operation for several years at the Kips Bay Station of the New York Steam Corporation and at the East River Station of the New York Edison Company. These are both fired with pulverized coal.

For one of the Chicago stations a new type of stud-tube construction was developed in which the slag screen and the water walls are studded with pins and refractory coated to collect the molten slag from the pulverized coal furnace and thus protect the tubes of the boiler.

In several of the large stoker installations zoned air control has been employed. By this means under-fire air is supplied automatically to different sections of the fuel bed in accordance with the requirements of the fire.

With the present high capacity boiler, high rates of forcing and high steam pressures, it is necessary to give special attention to the condition of the feed water. Despite the use of evaporators and various methods of feed-water treatment much trouble has been experienced with carry-over of solids in the steam to the turbines. In some cases these solids can be washed out with wet steam but in others they have necessitated shutting down the turbines and manually removing the scale from the turbine blades. In consequence, much experimental work and study has been devoted to this problem, and special types of separators in the boiler drums are now being tried out with encouraging results.

The steaming type of economizer is coming into more general use and higher air preheat temperatures are being carried successfully with stokers due to certain improvements in stoker design. At the Chester Station of the Philadelphia Electric Company underfeed stokers have been operated successfully with 500 degrees preheat. The use of diphenyl mixtures has proved satisfactory in one large station as a heat transfer medium between the preheater in the uptake and the air going into the furnace. This does away with the large amount of duct work necessary where the air is led direct from the preheater to the furnace or fuel burning equipment.

Abroad two new types of boilers have been developed. In one, the Velox boiler developed by Brown Boveri & Co. of Switzerland, the combustion chamber is charged with a mixture of fuel and air under pressure and explosion takes place, producing a pressure 4 to 5½ times the charging pressure. The products of combustion pass at high velocity through the small diameter boiler tubes and very high rates of heat transfer result. The cooled gases are then passed through a gas turbine which drives the charging compressor. On test this boiler has shown an efficiency of 90 per cent and a heat release in the combustion chamber of over 800,000 b.t.u. per cubic foot per hour.

The other boiler is of the rotary type, developed by Sulzer Bros. There is a rotating drum to which is attached tubes in the form of loops, the whole rotating at 3000 revolutions per minute in a specially constructed furnace. Due to the high rotative speed the water in tubes exerts a high

centrifugal force and maintains the desired pressure.

The highest pressure boilers installed in Europe during the year were the Loeffler units at the Technical Institute of Moscow. These operate at 1900 pounds steam pressure and are each capable of generating 350,000 pounds of steam per hour.

In Canada there has been increasing use of electric steam boilers employing surplus hydro power to generate steam for process use in the paper mills and other industries. In the last two years over 350,000 kilowatts of electric steam-generator capacity has been installed or is in order. The total of such capacity in Canada at the present time is 1,275,000 kilowatts.

**BOKHARA**, bō-ka'ra. The name applied to a former central Asian state incorporated in the Uzbek Soviet Socialist Republic, Dec. 5, 1924. See **SOVIET CENTRAL ASIA**.

**BOLIVIA**. A republic occupying the high central Andean region of South America, bounded by Brazil and Paraguay on the east, by Argentina on the south, by Chile and Peru on the west, and by Brazil on the north. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

**AREA AND POPULATION.** The area is 514,155 square miles, excluding the area under dispute with Paraguay; the population was estimated in 1930 at 2,972,583, including about 1,586,050 Indians, 426,200 whites, and 898,400 of mixed race. The 1900 census population was 1,816,000. The chief cities, with their estimated populations in 1929, were: La Paz, 149,500; Oruro, 41,410; Cochabamba, 36,828; Sucre, 35,181; Potosí, 34,679; and Santa Cruz, 30,851. Spanish is the language of the educated classes, that of the natives Aymara and Quechua. Roman Catholicism is the state religion.

**EDUCATION.** Elementary education is free and nominally compulsory, but the percentage of illiteracy remains high. In 1928, there were 83,548 pupils in public primary schools, 22,069 in private schools, and 6537 in secondary and higher schools. There are two universities, at Sucre and La Paz, and eight other institutions offering some university instruction, with a total of about 800 students.

**PRODUCTION.** Bolivia's financial and governmental structure is based primarily upon the exploitation of its tin deposits, which normally provide 90 per cent of the value of all exports. The mass of the Indian population, however, maintains itself on a bare subsistence level by primitive agriculture. For the sixth successive year, Bolivia in 1932 suffered from severe economic depression caused chiefly by the collapse of tin prices. Tin exports during 1931 (31,138 tons, valued at \$17,719,000) were 18.4 per cent less in volume and 35 per cent less in value than in 1930 (38,167 tons, valued at \$27,236,000). All mineral exports during 1931 aggregated 56,826,034 fine kilos, valued at 56,854,828 bolivianos (boliviano equals \$0.3649 at par), a decrease of about 10 per cent in volume and of 35 per cent in value, as compared with the previous year. Besides tin, Bolivia produces copper, silver, lead, bismuth, wolfram, gold, zinc, petroleum, and antimony.

About 6,500,000 acres were under cultivation in 1931, the principal crops being potatoes, cacao, coffee, barley, highland rice, and rubber. Live-

stock in 1931 included about 2,046,300 cattle, 5,786,000 sheep, and 2,000,000 llamas and alpacas. American investments of all kinds in Bolivia, largely in mining and public utilities, increased from \$10,000,000 in 1913 to about \$133,000,000 in 1929. American direct investments (1930) were estimated at \$61,819,000.

**COMMERCE.** The drastic decline in Bolivia's foreign trade from 1929 to 1931 is shown by the accompanying statistics issued by the U. S. Bureau of Foreign and Domestic Commerce.

#### BOLIVIAN FOREIGN TRADE, 1929-31

	Exports	Imports
1929 .....	\$50,795,000	\$25,910,000
1930 .....	36,948,000	21,149,000
1931 * .....	22,197,000	10,920,000

\* Preliminary.

Imports in 1931 were 48.3 per cent less than in 1930, while exports fell approximately 40 per cent. Exports of all Bolivian products except zinc and gold declined sharply. Due to the transfer of Bolivian zinc stocks to European markets, shipments of zinc increased 143 per cent in volume and 85 per cent in value in 1931; there was no marked increase in demand. Silver exports declined to 177 tons, valued at \$1,368,000, from 217 tons, valued at \$2,093,000, in 1930. Cotton and wool textiles, machinery, wheat, sugar, and oil were the chief imports.

Great Britain took 82.1 per cent of the 1931 exports (76.4 per cent in 1930) and the United States 5 per cent (13). The three chief sources of imports in 1931 were the United States, which furnished 25.2 per cent of the total (27.8 in 1930), Germany 17 per cent (13.6), and Great Britain 16.4 per cent (16.7).

**FINANCE.** According to information issued by the Comptroller General's office, actual revenues declined from 35,861,120 bolivianos in 1930 to 22,878,198 bolivianos in 1931, including the supplementary period to Mar. 31, 1932. Ordinary expenditures for the year 1931 and the first quarter of 1932 amounted to 32,920,176 bolivianos, leaving a deficit of 10,031,978 bolivianos, exclusive of 23,316,380 bolivianos falling due during the period on the internal and external debt but which were not paid. Internal credit operations during the period yielded 10,141,111 bolivianos, enabling the comptroller's office to report a balance of 99,133. A deficit of 15,520,657 bolivianos was anticipated for 1932, with revenues estimated at 19,350,000 bolivianos and expenditures at 34,870,657 bolivianos. The 1933 budget, as passed by the Lower Chamber of Congress carried a further deficit of 11,396,022 bolivianos. The outbreak of war with Paraguay during 1932 probably threw the budget further out of balance than the available information indicated.

The national debt on Dec. 31, 1931, was divided as follows: dollar bonds outstanding, \$61,349,523; sterling debt, £156,000, converted at official exchange rate; internal consolidated debt, 26,816,128 bolivianos; internal floating debt, 40,825,704 bolivianos. The average exchange rate of the boliviano (par, \$0.365) was \$0.3638 for 1930 and \$0.3292 for 1931. On Jan. 12, 1932, an official rate of 15 bolivianos to the pound sterling was adopted, valuing the boliviano at slightly less than \$0.25.

**COMMUNICATIONS.** Bolivia in 1932 had about 1384 miles of railway lines, 1630 miles of permanent highway (excluding some 1166 miles of

temporary highway), and a network of airlines operated by the Lloyd Aereo Boliviano connecting the principal cities, which carried 3769 passengers and 97,235 kilograms of freight and mail in 1227 flights during 1931. A steamer service was in operation on Lake Titicaca.

**GOVERNMENT.** The Constitution of 1880 vests executive power in a President, elected for four years by direct popular vote and ineligible for reelection. Two vice presidents are similarly elected. There is a Congress of two chambers, the Senate of 16 members elected for six years, and the Chamber of Deputies of 78 members, elected for four years. One-third of the Senate and one-half of the Chamber retire every two years. The President selects a Cabinet of six members. Constitutional government, suspended on June 28, 1930 by revolution, was reestablished on Mar. 5, 1931, with the inauguration of Dr. Daniel Salamanca as President, following the elections of Jan. 4, 1931. A non-party cabinet was then appointed.

### HISTORY

**THE BOLIVIAN-PARAGUAYAN WAR.** Despite the unceasing efforts of the neutral American nations, supported by the League of Nations, the long-threatened war between Bolivia and Paraguay for possession of the Chaco Boreal broke out in earnest in 1932. The struggle commenced in July and was still in progress at the end of the year, with the result in doubt.

The Chaco Boreal (Northern Chaco) comprised the entire lowland territory lying north of the Pilcomayo River and west of the Paraguay River and extending to the undisputed boundary of Bolivia. Both Bolivia and Paraguay claimed the entire territory. Bolivia, eager to secure an outlet on the navigable waters of the Paraguay River, had gradually pushed her frontier in a southeasterly direction. Finally, after occupying more than half of the disputed territory, Bolivia's further progress was blocked along a north-south line on the sixtieth meridian about 200 miles west of the Paraguay River by a chain of Paraguayan blockhouses guarded by small frontier patrols. Bolivia erected a similar chain of small fortresses and it was along this frontier that the undeclared war of 1932 was fought out.

The prelude to actual war consisted of a series of isolated clashes between border patrols for possession of various points. In 1928 and again in 1931 such clashes caused the neutral Pan American nations and the League of Nations to intervene to prevent a general outbreak. With the 1931 outbreaks, the five neutral nations (United States, Cuba, Colombia, Mexico, and Uruguay) represented on the Pan American Commission of Conciliation, invited both Bolivia and Paraguay to send delegates to Washington to negotiate a non-aggression pact under the auspices of the Commission (see 1931 YEAR BOOK). These negotiations, commenced Nov. 11, 1931, continued unsuccessfully until a renewal of the Chaco clashes in July, 1932, led both disputants to resort to force.

From April on there were persistent reports of a Bolivian mobilization on the frontier. About the same time, the Bolivian Foreign Minister, in a statement criticizing the League of Nations for sending new Mennonite colonists to the Chaco Boreal without asking Bolivia's consent, declared that further colonization west of the Paraguay River would be under Bolivian auspices.

(Large Mennonite colonies had previously been settled in the disputed region under Paraguayan auspices.) The border skirmishes increased, with each side accusing the other of aggression. The Paraguayan Congress on August 1 authorized the President to mobilize the reserves and on the following day Paraguay protested to the League of Nations, charging Bolivian violation of Articles X and XI of the League Covenant. The Commission of Neutrals on the same day (August 2) appealed to Bolivia to suspend hostilities.

When Bolivia rejected the appeal on August 3, the 19 neutral members of the Pan American Union dispatched an identical note to both Bolivia and Paraguay in which they declared that they would not recognize territorial gains made in the Chaco by force of arms. Like Secretary of State Stimson's similar declaration with respect to the Manchurian situation (note of Jan. 7, 1932), the action of the Pan American neutrals

THE CHACO

Showing the Truce Proposals of the Commission of Neutrals Made on Dec 15, 1932

was based upon the Kellogg-Briand Pact. Although the dispute was not officially referred to the League of Nations, the President of the League Council reminded both disputants of their obligations under the League Covenant (see LEAGUE OF NATIONS). Hostilities nevertheless continued. The four neighboring countries (Argentina, Brazil, Chile, and Peru) now acted to prevent the spread of the conflict through a joint agreement to preserve strict neutrality in case war was declared. Representatives of these nations also joined the Commission of Neutrals at Washington in new efforts to terminate the controversy.

On August 10, the Commission of Neutrals presented a joint request for a truce, but the disputants were unable to agree upon the necessary conditions. The commission on August 29 again proposed a truce, this time for 60 days. It was rejected by Paraguay because it would have left temporarily in Bolivia's possession Forts Boqueron, Corrales and Toledo, which the Bo-

livians had captured since June 1, 1932. Bolivia also proposed a 30 day truce, which Paraguay rejected on the same ground. Likewise Paraguay's proposals were rejected by Bolivia. The neutrals now considered more drastic means of bringing the struggle to a close. Proposals for an economic blockade and for the withdrawal of diplomatic representatives at Asunción and La Paz met a favorable reception among virtually all of the American nations except Argentina.

Foreign Minister Saavedra Lamas of Argentina informed the Commission of neutrals that his country would not cooperate in any act "extending beyond the limits of good offices and the moral influence of the opinion of all the continent." He further stated that any proposal to settle the controversy must be first accepted by Bolivia and Paraguay. Argentina's position blocked any effective action by the neutral powers. The League of Nations Council repeatedly reminded the disputants of their obligations under the Covenant and supported the Washington Commission of Neutrals, but with no better success. Bolivia and Paraguay were left to fight out the dispute to its bloody conclusion.

Replying to the Argentine memorandum on November 4, the Commission of Neutrals declared that the American nations would not be fulfilling their duties as members of the family of American states if they did not exert unmistakably and unequivocally their full efforts on behalf of peace. Referring to their proposal of the previous August for a return to the military *status quo* in the Chaco, they said:

"The sanguinary events of the last six weeks have unfortunately justified the appositeness of this proposal of August 2. Had it been accepted the recent bloodshed would have been avoided."

The Commission of Neutrals on December 15 proposed a settlement of the dispute by arbitration, following the automatic cessation of hostilities and the withdrawal of both armies from the territory in dispute. The plan called for the withdrawal of the Paraguayan forces to the Paraguay River and of Bolivian forces to a line running northeastward from Fort Ballivian on the Pilcomayo River to Fort Vitroneros near the upper reaches of the Paraguay River. The proposal was accepted provisionally by Bolivia but was rejected by Paraguay (December 17) on the ground that it was openly favorable to Bolivia. Subsequently Paraguay recalled its delegate to the Commission of Neutrals.

**THE MILITARY PHASE.** No declaration of war was made by either side throughout the Chaco struggle. The conflict entered a serious stage toward the end of July. Probably due to earlier mobilization, Bolivia gained the initial victories, driving the Paraguayans from Forts Boquerón, Toledo, and Corrales. The Chaco region in which the fighting occurred was extremely difficult of access from Bolivia, while within comparatively easy reach from Asunción. This advantage in communications enabled Paraguay to reinforce and supply her forces, which took the offensive toward the end of August.

A month of desperate fighting, in which from 15,000 to 20,000 were engaged on both sides, ended with Paraguay in possession of Forts Boquerón and Toledo, which represented the spearhead of the projected Bolivian advance to tide-water. By September 22, the Paraguayans had recaptured five Paraguayan forts and in addition taken four Bolivian forts. They now

launched an attack southward from the Boquerón area against Fort Arce, the Bolivian advanced headquarters, which they captured on October 23.

Upon the fall of Fort Arce, and the collapse of two cabinets in La Paz within a week, Bolivia on October 26 opened negotiations for peace through the Commission of Neutrals at Washington. While the negotiations dragged on Paraguay continued her victorious advance against stubborn resistance. Fort Platanillos, a strategic junction of several good roads connecting Bolivian forts, fell on November 6. It lies 43 miles west of Fort Boquerón, thus indicating the extent of the Paraguayan advance. The offensive was now directed against Fort Muñoz, the main Bolivian concentration centre, but the advance was held up by the determined opposition at Forts Saavedra, Murguía, and Samaklay.

The Paraguayans continued their desperate efforts to capture the key positions of Saavedra and Muñoz until December 10, but proved unable to break through due chiefly to Bolivia's superior artillery equipment. The Bolivians now resumed the offensive, recapturing Fort Platanillos on December 13. At the suggestion of Pope Pius XI, a Christmas Day truce was agreed upon. The next day the struggle was resumed. On December 26 General Hans Kundt arrived at the front to take charge of the Bolivian drive. The former chief of the Bolivian army, General Kundt was recalled by the Bolivian government from Germany, where he had been forced to flee upon the deposition of President Siles in 1930. In response to his demand for more troops, Bolivia mobilized a new army of 20,000 reserves, bringing the total Bolivian forces sent to the Chaco to 60,000. On December 27, Paraguayan forces began a retreat to their strongly entrenched position at Fort Nana-wa, also known as Fort Ayala.

**DEVELOPMENTS IN BOLIVIA.** The reverses suffered by Bolivian troops in the Chaco aroused the populace in La Paz to fury. It was charged that political intrigue and bickering was hindering the proper organization of the country for war and that the troops at the front were not receiving adequate supplies and support. On November 5, President Daniel Salamanca and his government, which assumed office Mar. 5, 1931, for a four-year term, was forced to resign. In the preceding month the President had formed four cabinets, two of them coalition groups, in a vain effort to secure the cooperation of Congress during the war emergency.

The Liberals, however, who with 36 out of the 78 seats formed the largest group in the Lower Chamber, were determined to return to power. When Vice President Tejada Sorzano (Liberal) refused to cooperate in forming another cabinet, President Salamanca formed one exclusively of his own party. Congressional opposition forced the new cabinet to resign and President Salamanca urged the Vice President to form a coalition cabinet to which he could delegate the Presidential powers. Meanwhile there had been popular demonstration in La Paz, directed mainly against Congress and the politicians.

Earlier in the year Congress passed, by a majority of two votes, and the President signed a bill permitting absolute divorce. On August 14, Congress approved the revision of the Kemmerer banking laws, which went into effect in July, 1928, initiating a central banking system. A decree of May 25 abolished the Permanent Fiscal Commission, created in accordance with the pro-

visions of the Equitable Trust Company loan of 1922, and transferred its functions to the National Tax Collecting Company, operating under a concession from the government. The default on the payment of interest and principal due on Bolivia's foreign loans continued throughout the year. On March 16, former President Hernando Siles was convicted by the Senate of illegally deporting Congressmen and of misusing public funds.

**BOOTLEGGING.** See PROHIBITION.

**BOOTS AND SHOES.** In comparison with other commodities the production of boots and shoes (other than rubber) showed little decline in 1932. According to *Commerce Reports*, the manufacturers in the United States produced 313,289,854 pairs as against 316,239,809 pairs in 1931, a decrease of 0.9 per cent, but an increase of about 3 per cent over the 304,170,000 pairs produced in 1930. Women's shoes constituted 113,943,757 or 36.3 per cent, of the total production in 1932; men's footwear, 74,492,771 pairs, were 23.8 per cent of the total; slippers and moccasins for housewear, 38,211,968 pairs, were 12.2 per cent, and misses and children's shoes, 33,599,982 pairs, 10.7 per cent. The production of women's shoes increased 1.2 per cent over 1931; slippers and moccasins increased 7 per cent, while men's shoes dropped 3.8 per cent from 77,419,567 pairs produced in 1931. About 1,350,000 pairs of boots and shoes were imported into the United States in the first 11 months of 1932, of which 76.2 per cent, or 1,029,500 pairs, came from Czechoslovakia.

The production of footwear in Canada rose in 1932 to 17,879,000 pairs from 17,678,000 pairs for 1931. See LEATHER.

**BORNEO.** See NETHERLAND INDIA, BRITISH NORTH BORNEO, SARAWAK, and BRUNEI.

**BOSELLI, PAOLO.** An Italian statesman, died in Rome Mar. 10, 1932. Born in Savonna June 18, 1838, he studied law at the University of Turin, but instead of practicing became a writer on literary and economic subjects. In 1870 he was elected to Parliament, and in the same year was also appointed a member of the permanent committee on finance and was made professor of financial science at the University of Rome. He had much to do with the formation of the Council for the Mercantile Marine, of which he became president in 1881. In 1888 he entered Crispi's first cabinet as under-secretary to the Ministry of Education and the following year was made Minister of Education, holding that portfolio until the fall of the government in 1891.

When Crispi returned to power at the end of 1893 Boselli became Minister of Agriculture, but six months later was transferred to the Ministry of Finance where he remained until 1896. He became Minister of the Treasury in Pelloux's second cabinet of 1899-1900, and in the first Sonnino ministry of 1906 held once again the

portfolio of Education. On the fall of Salandra in June, 1916, he formed a national government, which included representatives of every important group in the Chamber but the Socialists. His cabinet fell in October, 1917, following the Caporetto disaster. He was created a Senator in 1921, and was also first secretary to the King in the Order of Mauriziano and chancellor of the Order of the Crown. Among the learned societies of which he was president were the Italian Institute of History, the Turin Royal Academy of Sciences, and the Dante Alighieri Society. In addition to various books on social and economic questions he published a biography of the Marchese Lorenzo Parete and a treatise on Italian maritime law.

**BOSHER, KATE LEE LANGLEY** ("KATE CAIRNS"). An American author, died July 27, 1932, in Norfolk, Va., where she was born Feb. 1, 1865. She was graduated from the Norfolk College for Young Ladies in 1882 and five years later was married to Charles G. Bosher. Her *Mary Cary* (1910) and *Miss Gibbie Gault* (1911) won great popularity for their cleverly commingled humor and sentiment. She wrote also *The House of Happiness* (1912); *The Man in Lonely Land* (1913); *How It Happened* (1914); *People Like That* (1915); *Kitty Canary* (1917); and *His Friend, Miss McFarlane* (1918).

**BOSTON UNIVERSITY.** A nonsectarian institution of higher education in Boston, Mass., founded in 1869. The enrollment for the autumn session of 1932 was 10,627, distributed as follows: College of Liberal Arts, 582; College and Extension Courses, 548; College of Business Administration, 2910; College of Practical Arts and Letters, 564; College of Music, 170; School of Theology, 284; School of Law, 491; School of Medicine, 243; School of Education, 2469; School of Religious Education and Social Service, 99; Graduate School, 550. The enrollment for the 1932 Summer Session was 1717. The faculty numbered 568. The endowment amounted to \$4,014,543. In the 10 libraries of the University there were 150,116 volumes. President, Daniel L. Marsh, Ph.D., Litt.D., LL.D.

**BOSTON VEHICULAR TUNNEL.** See TUNNELS.

**BOSTON WATER SUPPLY.** See WATER SUPPLY.

**BOTANICAL CONGRESS, SIXTH INTERNATIONAL.** See BOTANY.

**BOTANY.** The year has been marked by active research in all branches of the science. As in past issues of the YEAR BOOK a brief summary of the more important papers published is given under appropriate headings.

In connection with the general subject a noteworthy fact is that efforts to exterminate the African puncture vine (*Tribulus terrestris*) in California have been costing the State \$150,000 annually, according to Ethelbert Johnson in Bulletin 528 of the University of California.

The executive committee of the Sixth International Botanical Congress was appointed, with Professor Went, of Utrecht, Holland, as president. The congress will meet at Amsterdam Sept. 9-14, 1935.

**MORPHOLOGY AND ANATOMY.** The history of the development of foliar organs continued to be a

favorite subject of investigation. Adriance S. Foster (*Am. Journ. Bot.* 19: 75-98, 1932) reported on cataphyll and foliage leaf ontogeny in the black hickory (*Hicoria buckleyi arkansana*). Edwin B. Metzke (*ibid.* 19: 477-507, 1932) discussed floral variation in *Stellaria media*. He found that flowers approximating bilateral and radial symmetry are more common than those that are wholly asymmetrical, and that surface tension phenomena, prevailing during flower development, may also play some part in determining the distribution of flower parts.

H. Prat (*Ann. des Sci. Nat. Ser. X. t. 14*, 1932) investigated the epidermis of various grasses, and regarded this as having some taxonomic value. Elva Lawton (*Am. Journ. Bot.* 19: 303-333, 1932) studied regeneration and induced polyploidy in ferns.

PHYSIOLOGY. D. T. MacDougall (*Ann. Missouri Bot. Gard.* 19: 31-43, 1932) discussed at length the progress made during recent years in the study of this branch of botany. He pointed out that it has drawn upon chemistry and physics in perfecting a technique which has been extended to genetics, bacteriology, and ecology.

The water lifting power of transpiration and the cohesion of water was demonstrated by Hiram F. Thut (*Am. Journ. Bot.* 19: 358-364, 1932) in a series of experiments. Living leafy twigs were used to pull mercury columns to heights exceeding barometric pressure. Loss of water from the twigs in transpiration caused the water columns to rise in a capillary tube, and these water columns supported columns of mercury. P. J. Kramer (*Am. Journ. Bot.* 19: 148-164, 1932) found that killed root systems absorb as much or more water as living ones. The complex of forces concerned in the absorption of water by plants with little transpiration differs from that of an actively transpiring plant.

Francis E. Lloyd (*Plant Phys.* 7: 131-138, 1932), discussing the fact that rubber is segregated in the parenchyma cells of guayule (*Parthenium argentatum*) instead of in the vascular cells as in Para rubber, suggested that the function may be for the purpose of prompt closure of wounds. J. E. McMurtrey Jr. (*Science*, N.S. 76: 86, 1932) found that the element thallium in the proportion of one part per million in solution is toxic to tobacco plants, the effects produced being similar to those of the disease known as freching.

Hitchcock, Crocker, and Zimmerman (*Contr. Boyce-Thompson Inst.* 4: 155-176, 1932) made an exhaustive study of the effects of illuminating gas on the lily, narcissus, tulip, and hyacinth. The plants were exposed to the gas during different stages of development in concentrations ranging from 1: 75 to 1: 40,000. All were retarded in growth by all concentrations used without causing either death or abscission. The curling and bending of leaves which resulted were found to depend particularly upon the age of the leaf, the rate of growth and the variety experimented upon. The effect upon the flower bud depended upon its age at the time of treatment.

In a field study of the relations of mycorrhiza to conifer seedlings, R. E. McArdle (*Journ. Agric. Res.* 44: 287-316, 1932) successfully inoculated the roots of the northern white pine and the Norway spruce with four different fungi. No proof was discovered that the presence of these mycorrhiza is either harmful or beneficial to the trees.

PHYTOCHEMISTRY. James B. McNair (*Am. Journ. Bot.* 19: 168-193, 1932) made an investigation of the various organic substances found in plant families in relation to climate and habitat. Volatile oils are obtained from 87 families, of which 57 per cent are tropical or subtropical, 18 per cent temperate, and 25 per cent widely distributed. Saponins occur in 71 families, of which 42 per cent are tropical, 16 per cent temperate, and the remainder widespread. Cyanogenic glucosides are found in 39 families, 51 per cent of which are tropical or subtropical and 20 per cent temperate. The production of carbohydrates has not been fully determined, only about 60 families having been investigated.

Citric acid production in the fungus *Aspergillus niger* was studied by Nandor Porges (*Am. Journ. Bot.* 19: 559-567, 1932). He found that sugar concentrations of 15 to 20 per cent were necessary for the highest yield.

PATHOLOGY. The study of various substances as fungicides continued to occupy the attention of many pathologists. John W. Roberts and Leslie Pierce (*Phytopath.* 22: 415-428, 1932) found zinc-lime, a spray composed of zinc sulphate, hydrated lime and water, very effective in controlling bacterial spot (*Bacterium pruni*) and peach scab (*Sclerotinia fructicola*). V. F. Tapke (*ibid.* 22: 429-442, 1932) found that formaldehyde controlled oat smut.

Experimental studies by Ezekiel, Taubenhaus and others on the root-rot fungus, *Phymatotrichum omnivorum* (*Phytopath.* 22: 443-474, 1932) showed that growth was markedly inhibited in the undiluted juices of monocotyledonous resistant plants, while profuse growth was obtained with juices of three out of four dicotyledonous susceptible plants. With diluted juices, on the other hand, good growth resulted even from the resistant species.

James Johnson and Theodore J. Grant (*Phytopath.* 22: 741-758, 1932) indicated that the contentions hitherto made that plant viruses may be fundamentally changed by the host affected are not supported by experimental results, as the properties of each virus were not radically affected by the host plant utilized. The fungi studied were tobacco mosaic, cucumber mosaic, tobacco ring spot and tobacco spot necrosis.

S. M. Zeller and E. K. Vaughan (*Phytopath.* 22: 709-714, 1932) described for the first time the strawberry disease known as "crinkle," at present confined to the Pacific coast States. It has the appearance of a virosis, but its true nature has not yet been determined. W. W. Mackie (*Phytopath.* 22: 637-644, 1932) mentioned a fungus disease new to California on maize and beans (*Rhizoctonia bataticola*). J. C. Dunegan (*U. S. Dept. Agric. Tech. Bull.* 273, 1932) described in detail a bacterial spot disease of the peach and other stone fruits.

E. R. De Ong (*Phytopath.* 22: 861-863, 1932), commenting upon the use of petroleum oil as an insecticide, referred to its lack of fungicidal value. A special form of pine tar oil has been developed that fills this need.

The studies of Starkey on the influence of higher plants on the micro-organic population of soil (*Soil Science* 32: 367-404, 1932), confirmed by Thom and Humfeld (*Soil Science* 34: 29-36, 1932), show that the bacterial flora of the soil tends to be augmented in proximity to the roots of higher plants.

White pine blister rust is proving a bad pest

in the northwest. According to Lachmund and Hansbrough (*Journ. Forestry* 30: 687-691. 1932) the sugar pine and the western white pine are fully as susceptible to this rust as the eastern white pine.

**GENETICS.** Prof. J. B. S. Haldane (*Am. Nat.* 66: 5-24. 1932), treating of the time of action of genes, demonstrated that they can not only act in the zygotes, gametes, or endosperms carrying them, but can be manifested over more than one life cycle. It is contended that change in the time of action has been an important factor in evolution, and that some cases of orthogenesis can be explained on this basis.

Various investigators have carried on cytological and genetic studies in cotton and maize, notably Harland and Hutchinson (*Journ. Genetics* 25: 261-292. 1932).

**ECOLOGY.** A. H. Wright and A. D. Wright (*Ecological Monog.* 2: No. 2. 1932) made an exhaustive survey of the habitats and composition of the vegetation of Okefinokee Swamp, in Georgia. This region is free from tidal influences, salt marshes and dunes, and the natural plant associations may be divided into six groups: (1) shallow marshes, locally called prairies; (2) wooded swamps or "bays"; (3) watercourses; (4) hammocks; (5) barrens; (6) marginal bogs or "strands." In general the vegetation of the swamp belongs to the Lower Austral zone.

V. E. Shelford (*Ecology* 13: 105-120. 1932) suggested some novel basic principles for the classification of plant communities and habitats, and proposes a number of new terms. J. E. Weaver and T. J. Fitzpatrick (*Bot. Gaz.* 94: 113-150. 1932) discussed the various dominant grasses of the tall grass prairie region in the western States, noting that *Andropogon furcatus* forms 80 per cent of the vegetation of the lowland, while *A. scoparius* is the most abundant species. The lowland grasses possess the ability to endure shade and form a thick sod, while the upland forms depend upon their ability to withstand drought.

In an elaborate survey of the ecology of the digger pine (*Pinus sabiniana*) in California, George W. Graves (*Bot. Gaz.* 94: 106-133. 1932) found it confined to the regions between 600 and 4000 feet altitude. It is invading the yellow pine forest in its upper limits, where it forms part of the chaparral, but is apparently not moving downward into the oak savanna.

Length of day in relation to the natural and artificial distribution of plants was discussed by H. A. Allard (*Ecology* 13: 221-234. 1932). David Potter (*Rhodora* 34: 69-89. 1932) reviewed the botanical evidence of post-Pleocene marine connection between Hudson Bay and the St. Lawrence basin.

**TAXONOMY.** An exhaustive monograph of the genus *Cuscuta* was presented by Truman George Yuncker (*Mem. Torr. Bot. Club.* 18: No. 2. 1932). Margaret Ferguson and Alice Ottley (*Am. Journ. Bot.* 19: 385-405. 1932), continuing their studies of the genus *Petunia*, concluded that *P. axillaris* and *P. violacea* are the ancestors of a greater part, if not all of the cultivated forms. The character of the pollen grains was believed to be of diagnostic value.

G. W. Martin (*Bot. Gaz.* 94: 421-435. 1932) discussed the systematic position of the slime molds, which have been regarded both as plants and as animals. If the fungi in general, as a group, are considered as descended from the

green algae, the slime molds must be excluded. But if the fungi are treated as a monophyletic group descended from the colorless flagellates, the Myxomycetes form a natural lowest class, the others being the Phycomycetes, Ascomycetes, and Basidiomycetes. The author also suggested the employment of a more exact terminology in referring to the fungi.

**BIBLIOGRAPHY.** The following are among the important books published during the year. J. C. Liu. *Systematic Botany of the Flowering Families in China*. Henri Vetch, Peiping. F. B. H. Brown. *Flora of Southeastern Polynesia*. 1. *Monocotyledons*. Honolulu. L. Chalk and J. Burt Davy, editors. *Forest Trees and Timber of the British Empire*. I. *Some East African Coniferae and Leguminosae*. Oxford, Clarendon Press. P. A. Rydberg. *Flora of the Plains and Prairies of Central North America*. New York Botanical Garden. *International Address Book of Botanists*. Edited by a committee of the Fifth International Botanical Congress.

**NECROLOGY.** George C. Druce, died Feb. 29, 1932, aged 82. British botanist of note, author of many important local floras. William Willard Ashe, died Mar. 18, 1932, aged 60. Senior inspector of Forest Service, formerly curator of the Biltmore Herbarium, Biltmore, N. C., author of many papers, chiefly taxonomic.

**BOUNDARY DISPUTES.** See BOLIVIA, COLOMBIA, and PERU under *History*.

**BOUQUET CANYON DAM.** See DAMS.

**BOWDOIN CONGRESS.** An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment of the autumn session of 1932 was 582. There were 61 faculty members. The productive funds of the college amounted to \$6,412,803, and the income for 1931-32 was \$544,474. There were more than 155,000 volumes in the library. President, Kenneth Charles Morton Sills, LL.D.

**BOWLING.** Otto Nitschke, of Cleveland, was the individual star of the 1932 American Bowling Congress held in Detroit in the spring. With the magnificent total of 731 pins, the Cleveland bowler succeeded Walter Clark as singles titleholder. The title carried a cash prize of \$300 with it. At this thirty-second renewal of the A.B.C. the doubles event for \$500, the highest prize awarded, was captured by Charley Daw and Frank Benkovic of Milwaukee with a total of 1385. The all-events honors went to Hughie Stewart of Cincinnati with 1980 for nine games, and the Jefferson Clothiers of Dayton, O., won the five-man team award with a score of 3108.

The International Bowling Association tournament was held at Milwaukee with Hank Marion, of that city, winning individual laurels with a new I.B.A. record score of 760. The St. Paul city team won the five-man championship with 3178.

Main honors in the ancient game of lawn bowling went to the William McPhail rink of Buffalo in the tournament held at Buffalo in August. The team beat the Robert P. Dunlop quartette of Chicago in the final for the Robertson Trophy, emblematic of the national championship.

**BOXING.** A new world's heavyweight champion was crowned in 1932. In a bout, slow and dull, at the new Madison Square Garden Bowl in Long Island City in June, Jack Sharkey, Boston sailor, who had been knocking at the gates of fame for years, was finally given a verdict. He met Max Schmeling, German, who had been

awarded the championship of the world in 1930 when Sharkey fouled. In this second meeting things were about even for the fifteen rounds. The men at the ringside, able to see the way Sharkey's blows missed by slim margins, believed Schmeling retained his title, but the spectators in seats further removed thought otherwise and so did the judges; the decision in favor of the American stirred up tremendous excitement. There probably had never been such a difference of opinion between experts and judges and ringside patrons and those in the cheaper seats. The decision in Sharkey's favor was not the lone surprise of the sultry night in June. Prior to the day of the bout interest in the second meeting between the heavyweights had been low, but on the day of the bout long queues of fans stormed the box offices and when the two fighters entered the ring, 70,000 spectators were massed in the huge wooden crater that had been built in six weeks especially for the championship fight. The gate receipts totaled \$465,000, surprising in view of the depression and the low ebb of boxing in 1931 and early 1932. Sharkey did not defend his title in 1932. Schmeling further added to the still raging controversy by knocking out Mickey Walker in September. Sharkey had fought a draw with Walker in 1931.

Other heavyweights who gave promise of amounting to something of a threat to Sharkey's crown were Max Baer, Californian, who beat both Ernie Schaaf and King Levinsky, and Stanley Poreda, from Jersey City, who listed victories over Primo Carnera, Schaaf, and Tommy Loughran. Tony Shucco, lithe hitter from Boston, also shone in his few performances in the company of lesser lights of the ring.

Three other world's champions were crowned during the year—Kid Chocolate, Cuban negro, in the featherweight class, Jackie Fields among the welterweights, and Marcel Thil, French middleweight. Thil was recognized as middleweight champion, a berth vacant since Mickey Walker relinquished the title to advance to the heavyweight ranks in 1931, by the National Boxing Association. Thil defeated Gorilla Jones, winner of the N.B.A. elimination tournament, in Europe. The New York State Commission did not recognize Thil, considering Ben Jeby and Frank Battaglia the most promising candidates for the title. Fields regained his welterweight crown by outpointing Lou Brouillard, but did not defend his title because of eye trouble. Chocolate attained his high estate by knocking out Lou Feldman and successfully defending the title against Fidel La Barba. Bat Battalino had held the title at the start of the year but appeared for a title bout with Feldman in New York ten pounds overweight and his crown was declared forfeited. Tony Canzoneri, lightweight champion, only found one opponent for his title. He outpointed Billy Petrolle over the fifteen-round route in the fall in Madison Square Garden. Canzoneri fought frequently but could obtain nothing but catchweight bouts. Benny Leonard, former lightweight champion of the world, attempted a comeback but was knocked out by Jimmy McLarnin in a bout that packed Madison Square Garden.

Boxing was still in the doldrums during 1932, no real boxer or fighter rising above his fellows in the manner of Dempsey or Tunney. Nevertheless the standard of fights rose considerably and a lot of promoters and managers saw the fact

that well matched fighters give better exhibitions than poorly matched ones. There was a distinct feeling that professional boxing was on its way back to something like the heights reached in 1926 and 1927.

Outstanding of course in the amateur field was the Olympic competition in which two United States boxers—Eddie Flynn in the welterweights and Carmen Barth in the middleweights—carried off titles. Flynn had previously won the 147-pound title at the national championships in New York. Other winners in that tournament were Louis Salica, in the 112-pound class, Jimmy Martin in the 118-pound class. Dick Carter in the 126-pound class, Nat Bor in the 135-pound class, Fred Caserio in the 160-pound class, Homer Brandis in the 175-pound class and Fred Feary, San Francisco schoolboy, in the heavyweight division.

Dave Stoop of Penn State, Albert Wertheimer of Syracuse, and Alfred Lewis of Penn State were the individual stars in the college ranks. All three won titles in both the Eastern Intercollegiate and the National Collegiate A.A. championships. The list of winners in the Eastern Intercollegiates: 115-pound class, Dave Stoop, Penn State; 125-pound class, Albert Wertheimer, Syracuse; 135-pound class, John McAndrews, Penn State; 145-pound class, Alfred Lewis, Penn State; 155-pound class, Joseph Moran, Syracuse; 165-pound class, Al Gutzman, Syracuse; 175-pound class, Joseph Remus, U. S. Military Academy; team champion, Syracuse University. The winners in the N.C.A.A. competition: 112-pound class, Pete D'Allesandro, Temple; 118-pound class, Dave Stoop, Penn State; 126-pound class, Albert Wertheimer, Syracuse; 135-pound class, Bob Goldstein, University of Virginia; 147-pound class, Alfred Lewis, Penn State; 160-pound class, Dennis Flynn, Loyola (New Orleans); 175-pound class, Theofiel Wageman, New Hampshire; Heavyweight class, Doyle Hill, Tulane.

**BOY SCOUTS OF AMERICA.** An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Its national constitution declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scoutcraft, and to teach them patriotism, courage, self-reliance, and kindred virtues." Each boy, on joining the organization, takes the scout oath, admonishing him to keep himself "physically strong, mentally awake, and morally straight." The movement is nonsectarian and without military or political connection.

The membership as of October, 1932, numbered 831,192, of whom 615,476 were scouts (boys 12 to 21), 25,168 cubs (boys 9 to 12), and 190,548 scout leaders (adults connected with the movement, whether as scoutmasters, counselors, or committee members). There were 12 regional districts under the direct supervision of the national scout executives and subdivided into 559 local councils.

There are three plans of organization: a scout troop, a farm or home patrol, and a lone scout tribe. A scout troop consists normally of 32 members, each troop being made up of patrols of eight or less members under a boy leader. A scoutmaster and one or more assistant scoutmasters are provided for each troop. Troops are

usually organized in connection with an existing institution, such as a church or school. A farm or home patrol may be organized with as few as two boys; it is intended for boys in rural areas. Boys who live too far away from a community to join a scout unit may become lone scouts and carry on the scout programme through correspondence, or they may meet occasionally with other boys who are carrying on the scout programme in patrols or as lone scouts.

Among the foremost scout activities are camping and hiking, nature study, sea scouting, and many kinds of athletics, and crafts, such as swimming, first aid, signaling, knot-tying, and bridge making. Successive ranks in membership—tenderfoot, second, and first class—are achieved by passing tests, graded in difficulty. Merit badges, 100 in number, may be attained by the scout of first class rank by meeting requirements for each; they cover proficiency in pursuits both of the useful and the hobby type. In order to attain higher ranks in scouting the boy must meet requirements for length of service, develop his leadership ability, and maintain his scout obligations. These and his earning a certain number of merit badges entitle him to the ranks of star, life, and eagle scout.

In 1932 the organization provided opportunity for 300,000 boys to spend a week or more in boy scout camps. There were 554 camps conducted by local councils and more than 2400 troop camps. In its community service the boy scout movement coöperates with the U. S. Forestry Department in fighting and preventing forest fires and in conserving wild life, and planting trees. It renders services in local campaigns of various sorts, such as clean-up and safety-first campaigns, and coöperates with many national societies and movements.

The official magazine for boys is *Boys' Life*, and for scout leaders, *Scouting*. The national officers in 1932 were: president, Walter W. Head; treasurer, George D. Pratt; national scout commissioner, Daniel Carter Beard; chief scout executive, James E. West; deputy chief scout executive, George J. Fisher. Headquarters of the national council, the governing body, are at 2 Park Avenue, New York City.

**BRADFORD, GAMALIEL.** An American author, died in Wellesley Hills, Mass., Apr. 11, 1932. Born in Boston, Mass., Oct. 9, 1863, he attended Harvard College for a few months in 1882 but was obliged to leave on account of ill health. After 1886 practically all his time was devoted to writing. His early attempts were mostly in the field of the essay and fiction and include *Types of American Character* (1895); *The Private Tutor* (1904); *Between Two Masters* (1906); and *Matthew Porter* (1908). He then developed the "psychograph" method of literary portraiture, an attempt to discover the motives that determine an individual's overt acts, through which he became known as one of the greatest American biographers. Outstanding among his biographical works are: *Lee, the American* (1912); *Confederate Portraits* (1914); *Union Portraits* (1916); *Portraits of Women* (1916); *A Naturalist of Souls* (1917); *Portraits of American Women* (1919); *American Portraits, 1875-1900* (1921); *Damaged Souls* (1923); *The Soul of Samuel Pepys* (1924); *Bare Souls* (1924); *Wives* (1925); *Darwin* (1926); *D. L. Moody—A Worker in Souls* (1927); *As God Made Them* (1929); *Daughters of Eve* (1930); *The Quick*

*and the Dead* (1931); *Saints and Sinners* (1932); and *Biography and the Human Heart* (posthumous, 1932). Also he published several volumes of poetry, including *A Pageant of Life* (1905); *A Prophet of Joy* (1920); and *Shadow Verses* (1920), and the autobiography of humanity, *Life and I* (1928). In 1931 he was elected a member of the American Academy of Arts and Letters.

**BRAZIL.** A federal republic, the largest of the South American states, comprising roughly the east central third of the continent and all the former Portuguese colonies in the New World. Capital and largest city, Rio de Janeiro.

**AREA AND POPULATION.** The area is approximately 3,275,510 square miles, or more than 250,000 square miles greater than that of continental United States, and the total estimated population on Jan. 1, 1930, was 40,272,650, as compared with 30,635,605 at the census of 1920. The population in 1930 was divided among 20 States, one Federal District, and one Territory as follows: Alagoas, 1,189,214; Amazonas, 433,777; Bahia, 4,135,894; Ceará, 1,626,025; Espirito Santo, 661,416; Federal District, 1,468,621; Goyaz, 712,210; Maranhão, 1,140,635; Matto Grosso, 349,857; Minas Geraes, 7,442,243; Pará, 1,432,401; Parahyba, 1,322,069; Paraná, 974,273; Pernambuco, 2,869,814; Piauh, 809,508; Rio de Janeiro, 1,996,899; Rio Grande do Norte, 738,889; Rio Grande do Sul, 2,959,627; Santa Catharina, 948,398; São Paulo, 6,399,190; Sergipe, 547,965; Acre Territory, 113,725.

The chief cities, with the estimated populations in 1930, are: Rio de Janeiro, 1,468,621; São Paulo, 879,788; São Salvador (Bahia), 329,898; Recife (Pernambuco), 340,543; Belém (Pará), 279,491; Porto Alegre, 273,376; Fortaleza, 123,706; Bello Horizonte, 108,849; Nictheroy, 108,233; Maceió, 103,930; Curitiba, 100,135. Parahyba (74,104 in 1929), capital city of the state of Parahyba, was renamed Joao Pessoa in honor of the President of the state assassinated in 1930. Between 1820 and 1930, 4,518,558 immigrants entered Brazil. Of these, 78 per cent were of Latin origin and 2,561,981 settled in the state of São Paulo. Immigrants in 1930 numbered 67,066, of whom 18,719 were Portuguese, 14,076 Japanese, 4719 Poles, 4253 Italians, 4180 Germans, and 3218 Spaniards. The language is Portuguese but Italian and German are widely used in the south.

**EDUCATION.** At the census of 1920, 75.5 per cent of the population was illiterate. Education is free but compulsory in only seven states. In January, 1930, there were in all states 29,430 primary schools, with 2,052,000 pupils and 47,000 teachers; 212 recognized secondary schools and 367 professional schools, with more than 37,000 pupils; and 76 teachers' training schools. Advanced education is furnished by the official University of Rio de Janeiro, two private universities—at Bello Horizonte (Minas Geraes) and Curitiba (Paraná),—56 other faculties conferring degrees, and various professional and other institutions.

**PRODUCTION.** Although potentially one of the greatest agricultural countries of the world, Brazil in 1932 had only about 17,387,000 acres under cultivation, compared with some 1,236,000,000 acres covered by woods and forests. Coffee is both the chief crop and the main support of the national economy; in 1930 it furnished 62 per cent of the value of all exports. Brazil

furnishes about three-fourths of the world's coffee supply, exports in 1931 totaling 17,291,143 bags (of 132 pounds each), against 15,288,409 bags in 1930. It ranks second in the production of cacao (1,500,000 bags of 60 kilos, 1931-32). The 1930-31 yields of other important crops were (in bushels): wheat, 4,980,000; rye, 660,000; corn, 200,144,000; rice, 51,346,000; potatoes, 18,172,000; (in pounds)—coffee, 3,442,712,000; cane sugar, 2,065,574,000; cacao, 201,992,000; tobacco, 187,153,000; cotton, 259,706,000; rubber (exports), 31,942,000; alfalfa, 114,000 metric tons. No livestock census has been taken since 1920, when there were 34,271,000 cattle, 16,169,000 swine, 7,933,000 sheep, and 5,254,000 horses. Shipments of chilled and frozen meat occupied second place among Brazilian exports in 1930.

Manganese ore, ilmenite, gold, mica, low-grade coal, and silver are the chief minerals produced. The output of diamonds (mostly for industrial use) declined sharply in 1930 and 1931. One of the richest iron-ore deposits in the world was being opened up by foreign capital in 1932, total iron resources are estimated at one-fourth the world supply. Cotton weaving is the chief manufacturing industry. In 1929 there were 347 cotton factories with 2,620,471 spindles and 78,910 looms, 13 silk mills, 35 woollen mills, 16 jute mills, 18 paper mills with an output of about 70,000 metric tons annually, 15 packing plants, about 216 sugar factories, and more than 2000 tobacco factories. Electric power was produced by about 500 hydro-electric plants, with an aggregate capacity of 700,000 horse power.

COMMERCE. In the national currency Brazilian foreign trade for 1931 showed a slight gain over that of 1930, totaling 5,265,307 contos, as compared with 5,251,059 contos. This was attributable to heavy coffee shipments, whose value was more than half a million contos greater than in 1930, due to the sharp decline in import values. The Brazilian conto, however, depreciated in exchange value from an average of \$118 in 1929 to \$107 in 1930 and to \$70 in 1931. Converted to American currency, Brazilian foreign trade amounted to \$370,151,082 in 1931 and to \$562,389,000 in 1930. The accompanying table shows imports and exports for the years 1929 through 1931 both in Brazilian currency and the conversion value in U. S. gold.

BRAZILIAN FOREIGN TRADE, 1929-31 \*

	Imports (in contos)	Exports (in contos)	Imports (in dollars)	Exports (in dollars)
1929	3,527,738	3,860,482	416,626,000	455,923,000
1930	2,348,705	2,907,354	251,011,000	311,378,000
1931	1,880,934	3,898,164	131,256,000	238,895,000

\* Commerce Yearbook, 1932.

In terms of pounds sterling, preliminary 1932 trade figures showed exports of £36,629,000 and imports of £21,744,000.

Of the total exports in 1931, coffee amounted for \$164,999,654, or about 69 per cent. Chilled and frozen beef, yerba maté (Brazilian tea), cacao, raw cotton, hides and skins, and tobacco leaf were other exports. Imports were distributed over a wide range of commodities, including wheat, wheat flour, iron and steel manufactures, machinery and implements, drugs, chemicals, etc. The United States in 1931 continued as Brazil's best customer and chief supplier of imports, purchasing 44 per cent of the country's exports and furnishing 26 per cent of its im-

ports, as compared with 40 per cent and 24 per cent, respectively, in 1930. While imports from the United States declined 46 per cent in 1931 as compared with 1930, imports from Great Britain, Germany, and France all fell by 53 per cent and Argentina's share declined 45 per cent.

FINANCE. According to accountants appointed by the Provisional government of Dr. Getulio Vargas, the Federal accounts of the preceding government, headed by Dr. Washington Luis Pereira de Souza, for the years 1927, 1928, and 1929 showed an aggregate deficit of 491,169 contos paper instead of the reported surplus of 404,189 contos paper. A further deficit of 41,782 contos paper was reported in 1930, and in 1931 there was an estimated surplus of 73,575 contos paper. The budget for 1932 estimated revenues at 2,132,119 contos paper and expenditures at 2,126,525 contos, leaving an expected surplus of 5594 contos. The budget was thrown badly out of balance, however, by the outbreak of civil war during the year.

According to the Niemeyer report, the Federal indebtedness on Jan. 1, 1931, amounted to 2,533,916 contos paper of internal funded debt and a foreign debt of about \$671,039,000 divided as follows. Pounds sterling, 100,569,751; gold francs, 193,556,110; paper francs, 135,778,500; United States dollars, 143,336,998. The Department of Commercial Statistics estimated that in 1931 the obligations devolving upon Brazil as a result of foreign loans and investments and the services rendered by foreign corporations amounted to approximately £36,000,000 sterling. To meet these charges, Brazil had a surplus of exports over imports of only £20,948,000, leaving an unfavorable balance for the year of about £15,052,000. Similar adverse balances in previous years had been met by further foreign loans or investments. When the market for foreign financing was virtually closed in 1930 and 1931, the country's gold reserves were soon depleted and on Oct. 17, 1931, the government was forced to declare a three-year moratorium on gold payments on the bulk of the foreign debt. According to *Foreign Policy Reports* for Jan. 6, 1932, the Federal government, states and cities of Brazil were in default on 72 foreign loans. Nevertheless about \$11,651,000 of the Federal debt was amortized between Jan. 1, and Oct. 14, 1932.

The unit of currency is the milreis (\$0.11963 at par). Large accounts are usually quoted in contos (1 conto equals 1000 milreis). The gold milreis is a unit of account employed only in certain official transactions, revenues nominally collectible in gold milreis being actually paid in paper milreis at a rate varying daily with the rate of exchange.

COMMUNICATIONS. At the beginning of 1931 Brazil had 19,840 miles of railways, of which 11,829 miles were owned by the Federal government, 2982 miles were operated under Federal concessions, and 5024 miles belonged to the several states. The Central Brazil Railway (1817 miles) is the principal system and links all Brazilian railways with those of Uruguay, Argentina, and Paraguay. Highways in 1930 extended 75,497 miles, of which 963 miles were macadam. Air lines connected Rio de Janeiro with the chief cities of South America and the United States.

GOVERNMENT. The Constitution of 1891, modified in 1926, was suspended by the Provisional government of Dr. Getulio Vargas estab-

lished Nov. 3, 1930. The Provisional government thereafter governed by decree. Administration of the government was divided among nine departments and the national and state legislatures were dissolved pending the framing of a new electoral law and Constitution. For developments in 1932, see *History*.

#### HISTORY

THE CIVIL WAR. For three months during 1932 the greatest war the Western Hemisphere had witnessed, since the Civil War in the United States, raged in Brazil. A revolt against the Provisional government of Getulio Vargas broke out in São Paulo on July 9, enlisted considerable support from some of the other Brazilian states, and was put down October 3 only after severe fighting on three fronts, in which some 120,000 troops were engaged. The bitterly fought civil struggle left deep scars which promised to require many years to heal.

The causes of the revolt lay primarily in the rivalry between São Paulo and Minas Geraes—the two most important and richest states in the Union—for control of the Federal government. In 1931, Dr. Vargas, then Governor of the State of Rio Grande do Sul, united with Minas Geraes leaders in a successful revolt against the Government of President Washington Luis, a Paulista (see 1931 YEAR BOOK). Washington Luis and Julio Prestes, another Paulista who was President-elect, represented an oligarchy of wealthy landowners which had been in control of the Federal government. While Vargas represented the great landed proprietors of the State of Rio Grande do Sul, he had the support of the masses against Washington Luis and his clique.

Once installed as Provisional President, Dr. Vargas delayed a return to constitutional government pending a revision of the Constitution. He planned to prevent a return of the Paulistas to power by putting into effect the secret ballot and making voting compulsory. Despite the Provisional President's contention that the country was not ready for elections and that a draft Constitution embodying his reforms should first be prepared, he encountered growing opposition. Early in the year his own state withdrew its support and the four Rio Grande do Sul men on his Cabinet resigned, asserting that the time was ripe for a return to constitutional government. Vargas was accused, particularly in São Paulo, of seeking to perpetuate his rule. On May 14, 1932, Dr. Vargas met the demands of the constitutionalists by signing a decree fixing May 3, 1933, as the date for the election of a constitutional assembly. The decree was noteworthy in that it provided for a secret vote and woman's suffrage in choosing the assembly.

The Paulistas were not satisfied with the prospect of a year's delay. They felt the political and economic interests of their state were being neglected. In May there were riots and continual agitation in the state capital and on May 27 the Chief of Police at Rio de Janeiro announced that a score of politicians affiliated with the Washington Luis régime had been arrested for plotting against the government. After several months of preparation, during which a large and well-equipped army was mobilized along the frontier of the state of Rio de Janeiro, the Paulistas inaugurated their revolt by taking control of the city and state of São Paulo. Pedro de Toledo, Federal Governor of São Paulo state, resigned and

was installed as president of the revolutionary government.

The Paulistas had planned to capture Rio de Janeiro by a quick drive. Their offensive was halted, however, by the unexpected invasion of their state from the state of Parana on the south by a Federal army under General Waldomiro Lima. Part of the Paulista forces were dispatched to check General Lima and those remaining on the Rio de Janeiro front were forced to take the defensive. Blocked on two fronts, the Federal forces now commenced a drive into São Paulo from the state of Minas Geraes.

The strategy of the Paulistas was to hold the Federals at bay on these three fronts while striving to enlist the aid of other states. Considerable sympathy for the revolutionary movement was manifested in other states, but the Federal forces in each case were able to maintain control. On July 23 it was reported that Borges de Medeiros, several times Governor of Rio Grande do Sul, had assumed leadership of a revolutionary movement in that state. He was captured, however, by Gen. Flores de Cunha, the Federal interventor. On September 7, the Provisional government at Rio de Janeiro announced that a conspiracy to overthrow the state government of Minas Geraes and join the rebels, had been frustrated. The insurgent leader in the state, former President Arthur Bernardes, was taken prisoner.

Toward the end of September, the Paulista forces began to disintegrate. After the fall of Ribero Preto, on the railway line from São Paulo to Barretos, centre of a great cattle region from which São Paulo was drawing its food supply, Gen. Bertholdo Klinger-Holfer, commander of the São Paulo forces, on September 29 requested an armistice. General Klinger refused to sign the Federal armistice terms but the São Paulo state militia on October 3 declined to continue the struggle and the insurgent commander was forced to surrender unconditionally to the Federal commander-in-chief, Gen. Goes Monteiro. The total casualties on both sides were reported at over 15,000.

With the termination of the struggle, the Federal blockade of the port of Santos, which for three months cut off coffee shipments from the world's leading coffee port, was lifted, as was the embargo on cable and telegraph messages from the state of São Paulo. The Federals treated their defeated foes with moderation. Amnesty was granted to all except those directly responsible for the revolt, who were held for trial before a special tribunal. Approximately 200 revolutionary leaders were deported to Portugal. Pending the elections fixed for May 3, 1933, the Constitution of 1891, modified in part, was to remain in force and a civilian governor was named for São Paulo. General Lima was appointed military governor of the State. Both the Federal government and the state of São Paulo had issued paper currency to pay for their war expenditures, the amounts being reported at 112,000 contos (about \$8,400,000) and 200,000 contos (about \$14,500,000), respectively. The Federal government legitimized the state currency, as well as its own, issuing bonds against the State of São Paulo in order to force it to shoulder the burden of its own issues. Despite the moderation of the Federal government, popular demonstrations against it and the army recurred in São Paulo city on October 16 and again on October 26. In anticipation of the revision of the Constitution and new

elections, extensive political regroupings were under way at the end of the year and the nuclei of at least two new political parties had already been formed. By a decree of December 9, the Provisional Government suspended for three years the political rights of hundreds of persons connected with the Federal Government in 1930 and with the São Paulo revolt.

**OTHER DEVELOPMENTS.** The Provisional government during the year issued a number of decrees bearing upon the economic and political life of the country. On May 17 a new decree, reinforcing that of May 14, 1931, expressly forbade the states and municipalities to create imposts, taxes, or duties whose incidence was on interstate or inter-municipal commerce. The decree also provided for the gradual elimination of the export taxes levied by the states. In an effort to put idle currency in circulation and to aid hard-pressed banks by loaning them money on their frozen credits, the government by the law of June 9, 1932, established the *Caixa de Mobilização Bancária* (Banking Mobilization Bureau). All national and foreign banks were required to deposit in the Bank of Brazil, which financed the new bureau, all cash on hand in excess of 20 per cent of the sum total of their deposits. Interest of 1 per cent per annum was to be paid on such deposits.

A decree establishing the 8-hour day and six-day week in all industrial establishments was signed by President Vargas on May 4, 1932. The electoral law promulgated by the Provisional President Feb. 24, 1932, standardized election requirements throughout the country, not only for the projected national election of a constitutional convention but also for all elections held in Brazil, whether state, Federal, or municipal. All citizens over 21 years of age, both male and female, were made eligible to vote, unless they were paupers, enlisted men in the Army and Navy, or illiterates. In October, 1932, the government announced that it had expended about \$4,500,000 for drought relief in the northeastern states.

**THE COFFEE SITUATION.** The chief problem facing the Provisional government in its efforts to check the economic depression was the catastrophic decline in coffee prices, caused by the huge surplus which had accumulated over several years. On June 30, 1931, there were 18,000,000 bags of coffee in the São Paulo retaining warehouses. Added to the 17,500,000 bags at which the 1931-32 crop was then estimated, these made a total of 35,500,000 bags available in São Paulo alone. As the average coffee exports through Santos were estimated at 9,500,000 bags annually, this left a surplus of 26,000,000 bags to be disposed of if the market was to be restored. Accordingly the Provisional government in December, 1931, established a National Coffee Council to protect the industry during the period of transition from artificial stabilization of prices to free production based on the world demand.

The Council decided to purchase and destroy the surplus low-grade coffee and levied a 10-shilling tax on each bag exported for this purpose. In addition, new plantings were virtually prohibited, and steps were taken to improve coffee grades and increase world consumption. Up to June, 1932, the Council had purchased and destroyed more than 7,786,000 bags of 132 pounds each, or more than 1,027,752,000 pounds of coffee, at a cost of approximately \$63,000,000.

**EXTERNAL RELATIONS.** The seizure by Peruvians on September 1 of Colombia's Amazon River port of Leticia and Colombia's preparations to restore its sovereignty there by military force caused the Brazilian government on December 6 to send General Almerido de Moura to Fort Tabatinga on the Upper Amazon to maintain Brazilian neutrality. Heavy military, naval, and air reinforcements were placed at his disposal (see *COLOMBIA under History*).

For Brazil's rôle in the efforts to end the Bolivian-Paraguayan war in the Chaco, see *BOLIVIA under History*. The Brazilian-Venezuelan boundary commission resumed demarcation of the frontier in September, 1932.

**BREMEN.** See *GERMANY under Area and Population*.

**BRENNAN, LOUIS.** An Irish inventor, died in Farnborough, England, Jan. 17, 1932. He was born in Castlebar, Ireland, Jan. 28, 1852, but lived in Melbourne, Australia, from 1861 to 1880, where he was educated as a civil and electrical engineer. About 1880 he invented the dirigible torpedo bearing his name, which he sold to the British government. In 1887 he was made superintendent of a special government factory where this torpedo was manufactured for more than 20 years but was later supplanted by other models. From 1906 to 1912 he carried out his experiments with a gyroscopic monorail car which he predicted would revolutionize transportation but which, however, did not find favor with the railroad companies. During the World War he was assigned to the munitions inventions department of the Ministry of Munitions, being engaged in confidential aircraft research work, and from 1919 to 1926 held the same position with the Air Ministry where he developed the helicopter. He was created a Companion of the Bath in 1892 and was elected an honorary member of the Royal Engineering Institute in 1906. He was also a foundation member of the National Academy of Ireland.

**BRENTFORD, WILLIAM JOYNSON-HICKS, 1st VISCOUNT.** A British statesman, died in London, June 8, 1932. Born in Bexhill June 23, 1865, he attended the Merchant Taylors' School and practiced as a solicitor in London. Subsequently he entered politics and was elected to Parliament for northwest Manchester in 1908, for Brentford in 1911, and for the Twickenham division of Middlesex in 1918; he represented the latter constituency until 1929, serving also as chairman of the parliamentary air committee and of the parliamentary road transport committee. During 1922-23 he was parliamentary secretary to the Overseas Trade Department in Bonar Law's Cabinet. In the same government he was successively Postmaster-General and Paymaster-General and Financial Secretary to the Treasury, with a seat in the Cabinet. He was appointed Privy Councillor in 1923. On Stanley Baldwin's appointment as Premier he was made Minister of Health (1923-24) and Home Secretary (1924-29). During his tenure of the latter office there occurred the raid on Arcos, the London quarters of the Soviet trade delegation, which resulted in the severance of diplomatic relations between Great Britain and the U.S.S.R. He took a prominent part in defeating the Prayer-Book Measure, which he justified in *The Prayer-Book Crisis* (1928). He was a member of the Joint Select Committee on Indian Affairs and of the roads advisory committee of the Ministry of Transport. A baronetcy

was conferred on him in 1919, and in 1929 he was raised to the peerage as Viscount Brentford of Newick, Sussex.

**BREST-LITOVSK AFFAIR.** See POLAND under *History*.

**BRETHREN, CHURCH OF THE.** A church established in the United States in 1719 in Germantown, Pa. It originated in Schwarzenau, Germany, in 1708 and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh-day Baptists; and Old Order German Baptist Brethren. The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences and holds a general conference annually.

In 1932 there were 1027 churches and 1464 meeting houses, with a membership of 143,425, and 1190 Sunday schools, with an enrollment of 116,891. Foreign missionary work was carried on in India, China, and Africa, the total membership in the mission field being 5469. Expenditures for the year ending Feb. 28, 1931, totaled \$274,659. The denomination maintained eight colleges, one academy, and one theological seminary and training school, with an enrollment of 4199 students. At the close of school June, 1932, Mt. Morris College closed its doors after operating for 93 years. The *Gospel Messenger* is the official organ.

Officers of the general conference in 1932 were: moderator, the Rev. Chas. D. Bonsack; reading clerk, the Rev. Chas. D. Bonsack; and secretary, the Rev. J. E. Miller, all of Elgin, Ill. The Rev. J. W. Lear of Elgin, Ill., was executive secretary of the council of boards; the Rev. Otho Winger of North Manchester, Ind., president of the general mission board; the Rev. C. S. Ikenberry of Daleville, Va., president of the board of Christian Education; the Rev. H. L. Hartsough of North Manchester, Ind., president of the general ministerial board; and Dr. C. C. Ellis of Huntington, Pa., president of the general education board. With the exception of the general education board, which is located at 3635 Ordway Street N.W., Washington, D. C., the headquarters of all the boards are in Elgin, Ill.

**BRIAND, hr'ian, ARISTIDE.** A French statesman, died in Paris, Mar. 7, 1932. He was born in Nantes Mar. 28, 1862, and attended the College of St. Nazaire. Although trained as a lawyer, his interests were in the fields of journalism and politics. For several years he was a contributor to Radical and Socialist journals, such as *Le Peuple*, *La Lanterne*, and *La Petite République*, and with Jean Jaurès founded *L'Humanité*. He made himself conspicuous by advocating at a laborers' congress in Nantes in 1894 the adoption of the general strike idea. In 1902, after several unsuccessful attempts to enter Parliament, he was elected to the Chamber of Deputies, as a Socialist Radical, for the Department of the Loire. As *rapporteur* of the committee appointed to draft the bill providing for the separation of Church and State in France, he drew up a report which was a masterpiece of historic study, and which became the basis for the law of separation. In 1906 he received the portfolio of public instruction and worship in the Sarrien cabinet, and won the support of moderate elements. How-

ever, his acceptance of a post in a bourgeois ministry caused his exclusion from the Union-Socialist party. He held the same portfolio in Clémenceau's first cabinet (1906) and in 1908 was appointed keeper of the seals and minister of justice and worship.

In 1909, on the fall of Clémenceau's government, Briand became the first Socialist premier of France. Also he held the portfolio of the interior. The outstanding event of his ministry was the general railroad strike of 1910, which had been called by the General Confederation of Labor, a revolutionary syndicalist organization. More than 30,000 employees on government and private lines had responded and had disorganized the railway system of France. When acts of violence and sabotage became frequent, Briand decided upon an unusual but effective course. The strikers who were still subject to military service were "called to the colors" as reserves for three weeks' training. They were compelled to protect the railroads under threat of military punishment, and thus became their own strike breakers. The move, however, earned for the premier the hatred of the French working class, who bitterly denounced him as a renegade and a dictator. His defense was that the government was confronted by what was virtually rebellion and that society had the right to use all means, even illegal ones, for its own safety on the ground of *salus publica suprema lex*. In February, 1911, his ministry fell because it was accused by the Radicals with having shown remissness in enforcing the religious laws.

After acting as minister of justice in Poincaré's cabinet during 1912 Briand succeeded him as premier and minister of the interior in January, 1913. His tenure of office, however, was short, his resignation being occasioned in March by the defeat in the Senate of the bill, already passed by the Chamber, establishing proportional representation. He was keeper of the seals and minister of justice in Viviani's cabinet from August, 1914, to October, 1915, and then succeeded his chief as head of a coalition government in which he took over also the portfolio of foreign affairs. During the War period he worked steadily for greater unity of direction among the Allies, in spite of such difficulties as those with Great Britain over the Saloniki expedition. He remained in power until March, 1917, when he was succeeded first by Ribot and then by Clémenceau.

Emerging from his retirement, Briand was again made premier and minister of foreign affairs in January, 1921. In November of that year he attended the Washington Disarmament Conference, where he eloquently presented France's need of a strong military defense for "protectionist" purposes but at the same time denied all charges of imperialism. He met opposition in the carrying out of the terms of the Versailles Treaty, especially with regard to reparations, in the face of the demands of French nationalists for stronger and stronger measures against Germany. He retired voluntarily in January, 1922.

In 1924 Briand was appointed delegate to the League of Nations and was later made president of the French delegation to the Assembly. In this body he found an enlarged scope for his brilliant diplomatic and debating powers. In April, 1925, Painlevé made him minister of foreign affairs, an office which he held continuously thereafter,

with the exception of the three-day Herriot ministry in July, 1926, in spite of the many changes of cabinet chiefs. He was again premier from November, 1925, to July, 1926, during the difficult and discouraging period of the depreciation of the franc, his ministry falling and being reformed three times during those eight months. As foreign minister he was more successful, carrying out a policy of rapprochement with Germany marked by the Locarno treaties (December, 1925), the entry of Germany into the League of Nations (September, 1926), and the agreement to call committees of experts to discuss the reparations problem and the possible evacuation of the Rhineland before 1935, the date set by the Versailles Treaty (September, 1928). In 1926 he and Dr. Gustav Stresemann, German foreign minister, with whom he had worked with infinite patience, received the Nobel Peace Prize for 1925 for their efforts in drawing up the Locarno Pact, which fulfilled the "security" demands of both countries in its guarantee of a Franco-German frontier.

In 1927 Briand suggested a pact to outlaw war between France and the United States, which developed into the Kellogg-Briand Pact, a multilateral treaty for the renunciation of war as an instrument of national policy, signed by 15 nations at Paris in August, 1928, and subsequently ratified by the United States and numerous other signatories. In July, 1929, he was called upon for the eleventh time to form a ministry which lasted until October. His overthrow was caused by dissatisfaction with the terms of the Young Plan, and the popular belief that, at The Hague, the premier had bartered away French occupation of the Rhineland for a doubtful reparations promise on the part of Germany. In 1930 Briand issued to 26 governments, excluding Russia and Turkey, his famous memorandum on the organization of a European federal union. His last post was that of minister of foreign affairs in the government of Pierre Laval, where his policy of conciliation often clashed with the ultra-nationalism of the other cabinet members. His death occasioned tributes from statesmen of all nations for his conspicuous service toward achieving world peace and understanding.

**BRIDGE.** See **CONTRACT BRIDGE.**

**BRIDGES.** While the economic situation resulted in a much curtailed programme for new construction during the year, there were several notable bridge openings, and two immense bridge projects, those at San Francisco, appear to have at last reached the point where construction is about to begin.

**STEEL ARCHES.** Foremost among the bridges opened for traffic during the year is the great Sydney Harbor Arch in Australia. Eight years had passed since construction began when this 1650-foot silicon steel arch was opened in March. Only 2 feet less in span than the Bayonne Bridge of the Port of New York Authority, the Sydney Arch is a much heavier structure. The last, and most interesting, construction operation was that required to effect the "closure" of the arch trusses. These were built by the cantilever method from each shore to meet at the centre of the span. Inasmuch as temperature and other conditions make it impossible to determine beforehand the exact length required for the last chord and other members of the arch to be used in making a closure, it is necessary to adjust the

two halves of the arch to meet exactly at the centre. In the Sydney Harbor Bridge the two upper chords of each half arch were stayed back by means of  $2\frac{3}{4}$ -inch cables, 128 to each chord member, anchored in tunnels driven into rock on each shore. The final adjustment, lowering each half of the arch into position, was made by lengthening these back-stay cables—a difficult and delicate operation.

An interesting and novel method of construction was used in erecting a 547-foot steel highway arch over the Merrimac River at Tyngsborough, north of Lowell, Mass. Reversing the usual method of construction, the floor system of this bridge was placed on falsework and the arch was then erected over it.

Among the smaller steel arch structures placed in service during the year was the New Lambeth Bridge over the Thames at London, Eng. This work is primarily of historical interest, for its five steel arches (maximum 165-foot span) replace the old suspension bridge, built in 1862, which was the longest wire-rope suspension in England.

**CONCRETE ARCHES.** In concrete arch spans we note the formal opening on February 21, of the Arlington Memorial Bridge. This should be classed as a monumental architectural work rather than a bridge. The New Ridge Road or Veterans' Memorial Bridge (300-foot main span) over the gorge of the Genesee River in the city of Rochester, N. Y., properly belongs in the same classification.

In both cases, granite facing has been used to disguise the actual construction. In the former, an aluminum cover, molded and painted to resemble stone, has been placed on a steel bascule lift, and the latter, although a typical modern concrete arch, has been made to resemble an old, solid spandrel, Roman bridge.

Obviously, such methods cannot be accepted as meeting the standards of good engineering esthetics. Indeed engineers find the Rogue River (Ore.), Bridge (seven concrete arch spans of 230-feet each) and the great Westinghouse Arch at Pittsburgh far more interesting. The former (see 1931 YEAR BOOK) is the first American bridge in which the new method, devised by the French concrete expert, Freyssinet, for decentering and stress adjustment, has been used. It was completed in January.

The George Westinghouse Arch, with its central span of 460 feet centre to centre of piers, now takes its place as the longest concrete arch in America. The centring for this remarkable arch was very interesting. The two wide, flat ribs of the arch were reinforced, top and bottom, with 17  $1\frac{1}{4}$ -inch square steel bars. An innovation in placing this steel consisted in welding the splices in these main bars.

**VIADUCTS.** On November 24 one of the greatest viaduct structures in the world was opened to traffic. This 3-mile construction joins the west exit of the Holland Tunnel to the great New Jersey highway leading south to shore points and Trenton. It crosses the Hackensack and Passaic Rivers and several railroad lines, and it avoids several points of heavy traffic concentration. The two cantilever bridges, and the steel spans and concrete pier constructions brought the cost of this work to the huge figure of \$7,000,000 per mile.

Several smaller works of the viaduct type, such as the Burrard Street Bridge at Vancouver, B. C., opened July 1; the new Lorain Central Viaduct at

Cleveland, O., and the new Henley Street Viaduct at Knoxville, Tenn., indicate that the problem of relieving traffic congestion in and near our great cities will continue to stimulate this type of construction.

**SUSPENSION BRIDGES.** Although traffic during the first year of operation of the George Washington Memorial Bridge over the Hudson was disappointing (actual, vehicles  $5\frac{1}{2}$  million, pedestrians  $\frac{1}{2}$  million, against estimates of 8.7 and 1.4), it was stated that a net profit had been earned on this work. The completion of the costly granite facing of the New York approach and anchorage has been postponed.

The proposed 57th Street Suspension Bridge over the Hudson at New York, long a favorite project of the veteran bridge engineer, Gustav Lindenthal, is still in abeyance. It has been bitterly opposed by the Port of New York Authority and, with existing financial conditions, the realization of this great venture seems remote.

At the same time, the dangerous condition of New York City finances has forced the suspension of work on the great Tri-Borough Bridge over Hell Gate and the Harlem River. About six millions have been expended in completing the tower foundations and anchorages and work is still being continued on the designs and plans.

Suspension bridge interest thus centres in the West where the two great San Francisco projects, after many delays, appear to be at last under construction.

**THE GOLDEN GATE BRIDGE.** The right of the Golden Gate Bridge and Highway District to tax and to issue bonds was upheld by the California Supreme Court and the U. S. District Court early in the year. In August it was announced that the opponents of the project, backed largely by the ferry interests, had waived their right to appeal to the U. S. Supreme Court. Under these conditions, the legal obstacles seemed at last to be removed and an official ground-breaking ceremony was observed on December 17.

In the meantime, the right of way over government property for the south approach had been secured and exploratory borings for the tower and other foundations of the huge 4200-foot span were practically completed. The consulting board also undertook a final revision of plans and these plans as revised received the approval of the War Department in May.

With legal matters settled it was also possible to secure a market for the first of the \$35,000,000 of bridge bonds which had been authorized. An application for assistance which had been made to the Reconstruction Finance Corporation was accordingly withdrawn. In August a local syndicate agreed to purchase \$6,000,000 in bonds at 92 with interest at 5 per cent. The legality of thus selling bonds under par has been questioned but, apparently, has caused no further delay in operations.

These preliminary delays and difficulties, however, made it necessary to readvertise some of the work. Contracts made in June, 1931, were first extended six months and then an additional six months. When they lapsed in June, 1932, it was found possible to renew only that for \$10,484,000 covering the steel superstructure. Accordingly, new bids were called for on the other items and contracts for all other work, except paving, totaling \$12,794,904, were let November 4. Paving, which will not be required for some time, is to be let later.

**SAN FRANCISCO-OAKLAND BAY BRIDGE.** Through a conditional purchase of \$62,000,000 of the authorized \$75,000,000 bond issue, by the Reconstruction Finance Corporation, it has been possible to make plans to start this unique construction early in 1933. Bids for piers are called for on Feb. 2, 1933.

This huge construction, costing over twice the amount to be expended on the Golden Gate Bridge, will be  $7\frac{1}{2}$  miles long and will cross the 5-mile water barrier between San Francisco and Oakland.

The East Bay channel between Oakland and Yerba Buena Island requires a main cantilever span of 1400 feet and five 504-foot and fourteen 238-foot truss spans. In crossing the island a 500-foot tunnel is planned which is to be 70 feet wide and 50 feet high—a section not paralleled in size except in the Rove Canal tunnel at Marseilles, France.

The West Bay crossing, from Yerba Buena Island to San Francisco, is to be made entirely by suspension bridge construction. Two suspensions of 2310 feet each with side spans of 1160 feet are required. Progress on this work, so novel in conception and so extensive in scope, will be watched with great interest.

**MOVABLE BRIDGES.** Several noteworthy spans of this type were completed or under way during the year.

The Missouri, Kansas, and Texas R. R. built what is probably the longest railroad vertical lift span in the world (408 feet) over the Missouri River at Boonville, Mo. It is interesting to note that this is the fourth bridge at this site. The first bridge was built in 1874 and had a useful life of 10 years. Its successors lived 12 and 36 years, in each case being replaced by new bridges designed for heavier loads. Thus the design load for the original structure is unknown but it was replaced by a bridge designed to carry a Coopers E-24 locomotive loading, this by an E-30, and the present bridge for an E-70—a striking illustration of the growth of American train loads.

Another railroad vertical-lift bridge is the 302-foot span of the Rock Island Lines at Joliet, Ill., over the Des Plaines River. San Francisco, also, has replaced the old Third Street Bridge by a new bascule lift.

Attention should also be called to the small but unique, diamond shaped skew bascule built by the New Jersey Highway Department on U. S. Route 25 between Princeton and Trenton. This bridge crosses the Delaware and Raritan Canal and carries a 40-foot roadway. Skew bridges have been in general avoided by engineers both because their structural analysis is complicated and because they are difficult to fabricate. This bascule lift is therefore of great technical interest, particularly because of the great angle of skew,  $66^\circ$ , and the unique arrangement of the operating mechanism.

**MISCELLANEOUS.** The difficulty of stating with authority that any particular bridge is the longest or highest in its class in the world is illustrated by the news that in far off Czechoslovakia the longest all-welded bridge in the world was completed in 1931. The span of this bridge at Plzen (161 feet) is not remarkable compared with other types but it is, nevertheless, a record-breaking structure.

It is also reported that the Danish Government has let the contract in England for what will be the longest bridge in Europe. The bridge will

connect the islands of Zealand and Falster and will replace the present steamer service. The total length will be over 2 miles and it is planned to include two two-hinged arch spans of 440 feet and one of 540 feet in the construction which will consist primarily of steel deck arches encased in concrete. The cost is to be about \$10,000,000.

Outside of the two remarkable works at San Francisco the year 1933 will offer little of interest to the bridge engineer. Plans are indeed under way for a James River Bridge at Richmond, Va., and for a \$5,000,000 suspension of 1400-foot span at Vancouver, B. C., but it would appear that the great era of highway bridge building which has been chronicled in recent YEAR BOOKS has been brought, if not to a close, at least to a condition of suspended animation.

**BIBLIOGRAPHY.** *The Wichert Truss*, a new book by the well-known bridge engineer, Dr. D. B. Steinman, published by Van Nostrand, describes and defends a novel type of continuous truss construction. It is claimed that this new truss form, by a unique arrangement and proportioning of members, overcomes certain of the limitation of applicability of the usual continuous truss and offers new opportunities for economy of material. Its appearance at this time emphasizes the fact that, particularly in periods of depression, the engineer is forced to the development of new and more economical means of meeting the constantly increasing traffic needs of the country.

**BRIEUX**, bré', EUGÈNE. A French dramatist, died in Nice, Dec. 6, 1932. He was born in Paris, Jan. 19, 1858, and began his career as a journalist in Rouen, where he edited the *Nouvel-iste de Rouen*. At the age of 21 he collaborated with Gaston Salandri in the production of a one-act play, entitled *Bernard Palissy*. He did not, however, begin writing seriously for the stage until 11 years later, when he made his first success in *Ménage d'Artistes*, a defense of morality against caprice and of the family against disorder, which Antoine presented at the Théâtre Libre. After this he became one of the most prolific of French dramatists, his work being distinguished by seriousness of purpose and a deep insight into the social conditions of the time. His plays, almost without exception, dealt with definite social problems of the day. *Blanchette* (1892) was an arraignment of the system of public education in its application to girls of the working class. *M. de Réboval* (1892) was a satire on pharisaism. *L'Engrenage* (1894) showed the overwhelming temptations that a public official is subjected to under the French political system. *Les Bienfaiteurs* (1896) was a scathing denunciation of the insincerity and frivolity of fashionable charity. In *L'Évasion* (1896) were exposed the fallacies of an indiscriminate belief in the scientific doctrine of heredity, and in *Les trois Filles de M. Dupont* (1897) the miseries that French law and custom impose on dowerless girls of the middle class. *Le Berceau* (1899) was a plea for the indissolubility of the marriage bond after a child has been born. *Le Résultat des Courses* (1898) showed the evil results of betting among Parisian workmen, while *La Robe rouge* (1900), which was crowned by the Academy, exposed certain weaknesses of the French judicial system.

In *Les Remplaçantes* (1901) Brieux attacked the practice of putting children out to nurse. In *Les Avariés* (1901; Eng. trans., *Damaged Goods*) he painted the horrors of venereal disease. In

*Petite Amie* (1902) he portrayed the life of a Parisian shop girl. *Maternité* (1904) was an arraignment of society for its attitude toward the unmarried mother. *La Foi* (1909; Eng. trans., *False Gods*) was a study of dogmatic religion. *La Femme seule* (1912) showed chiefly how much more handicapped the French woman was when compelled to earn her own living than were the women of some other nationalities. His other plays include: *Les Hannetons* (1906); *La Française* (1907); *Simone* (1908); *Suzette* (1909); *Le Bourgeois aux Champs* (1914); *Au Japon par Java* (1914); *Les Américains chez Nous* (1920); *Trois bons Amies* (1921); *L'Avocat* (1922); *L'Enfant* (1923); and *La Famille Lavolette* (1928). He was elected a member of the French Academy in 1909, and was also made a commander of the Legion of Honor.

**BRIGHAM**, ALBERT PERRY. An American geologist, died in Washington, D. C., Mar. 31, 1932. He was born in Perry, N. Y., June 12, 1855, and was graduated from Colgate College in 1879. He attended also the Hamilton Theological Seminary and Harvard University. On ordination to the Baptist ministry he held pastorates in Stillwater, N. Y. (1882-85) and Utica, N. Y. (1885-91). In 1892 he became professor of geology at Colgate where he remained until his retirement in 1925. He taught at the summer schools of Harvard, Cornell, and the University of Wisconsin, and at the Oxford University school of geography. During 1902-13 he was chief examiner in geography for the College Entrance Examination Board, and during 1911-13 and 1917-19 was examiner in geography for the New York State Education Department. At the time of his death he was consultant in geography for the Library of Congress. He was president of the New York State Science Teachers' Association in 1905 and of the Association of American Geographers in 1914, and was a fellow of the Geological Society of America and of the American Association for the Advancement of Science. Besides editing the *Bulletin of the American Geographical Society* he wrote *A Text-Book of Geology* (1900); *Introduction to Physical Geography* (with G. K. Gilbert, 1902); *Geographic Influences in American History* (1903); *Students' Laboratory Manual of Physical Geography* (1904); *From Trail to Railway through the Appalachians* (1907); *Commercial Geography* (1911); *Essentials of Geography* (with C. T. McFarlane, 1916); *Cape Cod and the Old Colony* (1920); *Manual for Teachers of Geography* (with C. T. McFarlane, 1921); *Glacial Geology and Geographic Conditions of the Lower Mohawk Valley* (1929).

**BRIGHAM YOUNG UNIVERSITY.** A co-educational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. It comprises a graduate school; colleges of arts and sciences, education, commerce, applied science, fine arts; and a division of research and extension. In the 1932 summer session, 535 students were enrolled; the autumn session enrollment was 1355. The faculty numbered 117 members. The library contained 75,000 volumes and 50,000 pamphlets. The budget for the year was \$218,518. President, Franklin Stewart Harris, Ph.D.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** An association founded in York, England, in 1831, for the purpose of emphasizing the solidarity and unity of

interests among workers in all branches of science and to give a stronger impulse to scientific research, both theoretical and practical. It was incorporated by Royal Charter in 1928.

The annual meeting was held in York Aug. 31 to Sept. 6, 1932, under the presidency of Sir Alfred Ewing, late principal and vice-chancellor of the University of Edinburgh. His address at the opening session was entitled "An Engineer's Outlook." The section presidential addresses were as follows: section A (mathematical and physical sciences), "Some Aspects of Applied Geophysics," delivered by Prof. A. O. Rankine; section B (chemistry), "Some Aspects of Stereochemistry," by D. W. H. Mills; section C (geology), "The Contacts of Geology: The Ice Age and Early Man in Britain," by Prof. P. G. H. Boswell; section D (zoölogy), "The Pioneer Work of the Systematist," by Lord Rothschild; section E (geography), "The Geographical Study of Society and World Problems," by Prof. H. J. Fleure; section F (economic science and statistics), "Britain's Access to Overseas Markets," by Prof. R. B. Forrester; section G (engineering), "The Call to the Engineer and Scientist," by Prof. Miles Walker; section H (anthropology), "The Place of Archæology as a Science and Some Practical Problems in Its Development," by Dr. D. Randall MacIver; section J (psychology), "Current Constructive Theories in Psychology," by Prof. Beatrice Edgell; section K (botany), "The Growing Tree," by Prof. J. H. Priestley; section L (educational science), "The Advancement of Science in Schools: Its Magnitude, Direction, and Sense," by W. Mayhouse Heller; and section M (agriculture), "Sheep Farming: A Distinctive Feature of British Agriculture," by Prof. R. G. White. In view of the fourteenth International Physiological Congress in Rome there were no meetings of section I (physiology).

The association's annual meeting in 1933 was to be held in Leicester, under the presidency of Sir F. Gowland Hopkins, professor of biochemistry at the University of Cambridge. The other officers elected for 1932-33 were: general secretaries, Prof. P. G. H. Boswell and Prof. F. J. M. Stratton; general treasurer, Sir Josiah Stamp; and secretary, O. J. R. Howarth. Headquarters are in Burlington House, London.

**BRITISH CAMEROONS.** See under CAMEROON.

**BRITISH COLUMBIA.** The most westerly province of Canada, bounded by Yukon, and the District of Mackenzie on the north, Alberta on the east, the Pacific Ocean and Alaska on the west, and the State of Washington on the south. Capital, Victoria.

The area is 355,855 square miles and the population was 694,263 at the census of 1931 (524,582 at census of 1921). The chief cities, with 1931 census figures, and 1921 figures in parenthesis follow: Victoria, 39,082 (38,727); Vancouver, 246,593 (163,220); and New Westminster, 17,524 (14,495). In 1931, births totaled 10,867; deaths, 6397; marriages, 4097. For the year 1930 there were 1017 elementary schools, with 90,508 pupils; 29 superior schools, with 648 pupils; 82 high schools, with 14,075 pupils; 8 junior high schools, with 5186 pupils; the University of British Columbia (Provincial), with 1904 students; and Victoria College (Provincial) with 279 students.

The area sown to field crops in 1931 totaled 432,299 acres, and these crops were valued at

\$12,484,000, and the estimated gross agricultural revenue for 1931 was \$35,155,000. The net value of manufactured products of British Columbia and the Yukon was \$117,990,663 for 1930, compared with \$132,286,208 in 1931.

On Jan. 1, 1932 the installation of turbines in the development of water power was equal to 655,992 horse power. The gross value of mineral production in 1931 was \$34,883,028, a decline of \$20,508,812 from the 1930 output. The value of the principal minerals in 1931 was: Coal, \$7,684,155; lead, \$6,742,282; copper, \$5,280,363; zinc, \$5,237,520; gold, \$3,310,886; silver, \$2,247,514. The 1932 mineral output was estimated at \$26,675,000. The 1932 canned salmon pack totaled 1,081,031 cases (of 48 pounds), worth \$6,358,000.

In the fiscal year ended Mar. 31, 1930, provincial receipts totaled \$25,498,409 and expenditures \$25,066,980. The 1930-31 budget estimated receipts at \$28,115,000 and expenditures at \$28,073,000. Appropriations for 1931-32 amounted to over \$29,000,000. A provincial income tax, effective Apr. 1, 1931, levied 1 per cent on all incomes over \$15 a week in the case of single wage earners and over \$25 a week in the case of married wage earners. The gross funded debt on Mar. 31, 1930, was \$99,425,700; sinking funds, \$18,711,723.

Government is under a lieutenant-governor and legislative assembly of 48 members elected for five years. The 18th legislative assembly, elected July 18, 1928, consisted of 36 Conservatives, 11 Liberals, and 1 Laborite. In the Dominion Parliament the Province is represented by 6 Senators and 14 members of the House of Commons. Lieutenant-Governor in 1932, John W. F. Johnson. Premier and Minister of Railways, Dr. S. F. Tolmie. See CANADA.

**BRITISH EAST AFRICA.** A British possession covering a large area of Africa, and comprising KENYA Colony and Protectorate, UGANDA Protectorate, ZANZIBAR Protectorate, and the mandated territory of TANGANYIKA (formerly German East Africa). See these articles.

**BRITISH EMPIRE.** An empire consisting of: (1) GREAT BRITAIN and NORTHERN IRELAND, CHANNEL ISLANDS, and ISLE of MAN (2) the IRISH FREE STATE, INDIA, and the various British Dominions, Colonies, Protectorates, and Dependencies. Consult these articles. Including the mandated territories of PALESTINE, SOUTH-WEST AFRICA, CAMEROON, TOGOLAND, WESTERN SAMOA, and NAURU, the British Empire has a total area of 13,355,426 square miles, or about 26 per cent of the area of the world (51,723,000 square miles excluding polar regions). The population according to the 1931 census was approximately 485,302,800, or about 24 per cent of the estimated world population of 1,992,500,000 in 1929.

**BRITISH GUIANA,** gë-ä'nä. A British colony on the northeastern coast of South America, including the settlements of Berbice, Demerara, and Essequibo; bounded on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, according to the census of 1921, 297,691, excluding about 9700 aborigines. Estimated population in 1931, 312,000, including about 130,000 East Indians. In 1930 births totaled 10,438 and deaths 7174. Georgetown, the capital, had 57,921 inhabitants. Elementary schools receiving government aid in 1930 numbered 237 with 42,634 pupils.

Sugar is the principal crop, accounting normally for one-half the total value of exports. The sugar output (1930-31) was 115,000 tons from 56,126 acres. Rice, coffee, cacao, and limes are other leading crops. Cattle raising, mining, and lumbering are subsidiary occupations. Cattle in 1930 numbered 153,684. The gold production (1930) was valued at £25,276; diamonds, £323,836. British Guiana exported 119,616 tons of bauxite (the ore from which aluminum is extracted) in 1930. Manganese and mica are also found. The forested area of 78,000 square miles produces hardwoods and balata (gum). Imports in 1931 were valued at £1,595,205 and exports at £2,010,462, compared with £1,597,301 and £2,021,549, respectively, in 1930. Canada and the United Kingdom were the leading markets.

In 1931 revenues amounted to £916,939 and expenditures to £1,075,983. The funded public debt on Jan. 1, 1932, was £4,632,160. Accounts are kept in dollars and cents and both British and United States coins are in circulation. Vessels entered and cleared at the ports in 1930 numbered 2928, of 1,434,190 tons, as compared with 2860 vessels of 1,324,312 tons in 1929. There are 78 miles of railway, 500 miles of motor highways, 39 miles of canals, and 450 miles of navigable rivers. The colony is administered by a governor, assisted (since July 18, 1928) by a legislative council. Governor in 1932, Sir Edward Brandis Denham, who assumed office in June, 1930.

**BRITISH HONDURAS**, hōn-dōō'ras. A British Crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles west of Jamaica; sometimes referred to as Belize. Area, 8598 square miles; population, census of 1931, 51,347. Chief town and capital, Belize (population, 1931, 16,687). In 1930, there was a total school enrollment of 8701 and an average attendance of 6975.

The principal exports are bananas, mahogany, logwood and other forest products, plantains, coconuts, and chicle. In 1930-31 exports were valued at £933,119, imports at £1,013,442. Revenue for the fiscal year 1930-31 amounted to £238,774 and expenditure to £233,672. The public debt in 1929-30 was £384,652. Ships entering the ports in 1930 aggregated 313,587 tons (291,451 tons in 1928). There are 25 miles of railway. Wireless communication is maintained with New Orleans and Jamaica. Planes used in the bi-weekly air-mail and passenger service between Miami, Fla., and Cristobal, Canal Zone, stop at Belize. The United States gold coins are the standard of currency; the British sovereign is also legal tender.

The administration is under a governor assisted by an executive council of seven members and a legislative council of six official and seven unofficial members. Governor and Commander-in-Chief in 1932, Sir Harold Kittermaster, appointed, November, 1931.

**BRITISH IMPERIAL ECONOMIC CONFERENCE.** See AGRICULTURE under *World Agriculture*; CANADA; and GREAT BRITAIN.

**BRITISH INDIA.** See INDIA.

**BRITISH LABOR PARTY.** See SOCIALISM.

**BRITISH MALAYA.** British Malaya includes the Straits Settlements, the Federated Malay States, and the Unfederated Malay States. It extends from 6° 50' N. latitude to Singapore 1° 17' N. Total area, 52,603 square miles; total population (1931 census), 4,381,342, including

17,767 Europeans. The chief cities are Singapore, the capital, with a population (1931 census) of 445,778 and Georgetown (Penang), population (1921 census), 123,069. Three other British protectorates in Malaysia—British North Borneo, Brunei, and Sarawak—are seldom included in the term British Malaya and are never covered by British Malayan statistics. The statistics of the foreign trade for British Malaya include the Straits Settlements, the Federated and the Unfederated Malay States. The chief agricultural products are rubber, copra, palm oil, sugar, tapioca, pineapples, and resin. The production of rubber in 1931 was 425,086 long tons. Exports of canned pineapple amounted to 57,959 long tons in the same year. Mineral production (long tons) for 1931 was as follows: Coal, 374,500; tin (metal content of ore), 52,527; 780 tons of tungsten and 65 tons of wolfram were mined, mainly as by-products of the tin mines. Exports in 1931 were valued at 432,976,000 Straits dollars; imports at 462,059,000 Straits dollars. For component native states of the several protectorates and their respective statistics, see STRAITS SETTLEMENTS, FEDERATED MALAY STATES, UNFEDERATED MALAY STATES; see also BRITISH NORTH BORNEO, BRUNEI, and SARAWAK.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** A British protectorate, comprising the northern part of the island of Borneo (q.v.). Area, about 31,106 square miles; population, at the census of 1931, 270,043, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior. Europeans numbered only 533. The chief towns are Sandakan (11,936) on the east coast, and Jesselton, on the west coast.

Finance and trade statistics for 1930, with 1929 figures in parentheses, were: Revenue, £395,577 (£449,261); expenditure, £267,758 (£262,648); imports, £841,750 (£1,137,825); exports, £1,140,493 (£1,536,223). Trade is carried on chiefly, through Singapore and Hong Kong, with the British Empire. The chief products are rubber, timber, tobacco, rice, coconuts, and coffee. A railway runs from Jesselton to Melalap 127 miles in the interior. The territory is under the jurisdiction of the British North Borneo Company and is administered by a governor in Borneo and a board of directors in London. Governor in 1932, A. F. Richards (appointed February, 1930).

**BRITISH ROYAL COMMISSION ON UNEMPLOYMENT INSURANCE.** See UNEMPLOYMENT.

**BRITISH SOMALILAND.** See SOMALILAND PROTECTORATE.

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, UNION OF.

**BRITISH WEST AFRICA.** The general name given to the following British colonies, protectorates, and territories mandated to Great Britain, in West Africa: Nigeria colony, protectorate, and that part of the Cameroon mandated to Great Britain; Gambia colony, and protectorate; Gold Coast colony with Ashanti, Northern Territories, and the area in Togoland mandated to Great Britain; Sierra Leone colony, and protectorate. Consult the separate articles.

**BRITISH WEST INDIES.** A number of scattered island possessions of the British Empire in the West Indies, which are divided into six groups: (1) Bahamas, (2) Barbados, (3) Jamaica with Turks Islands, (4) Leeward Is-

lands, (5) Trinidad with Tobago, (6) Windward Islands. The islands have an aggregate area of 12,239 square miles and a population of slightly more than 1,900,000. A commission, headed by Sir Charles Fergusson, was appointed, during 1932, to look into the possibility of a closer political union between Trinidad and the Windward and Leeward Islands. See separate article on each group.

**BROOKINGS, ROBERT SOMERS.** An American merchant and philanthropist, died in Washington, D. C., Nov. 15, 1932. He was born in Cecil, Co., Md., Jan. 22, 1850, and attended the West Nottingham Academy. At 17 he began his business career as a clerk with the firm of Cupples & Marston, manufacturers and jobbers of woodenware, St. Louis, Mo. In 1872 when the firm was reorganized as Samuel Cupples & Co. he was admitted to partnership, and again in 1882 when it was reincorporated as the Samuel Cupples Wood-ware Co. he was made vice-president and general manager. On his retirement from business in 1896 he devoted himself to philanthropy and to the development of various cultural projects, among which were the Mercantile Library of St. Louis, the St. Louis Choral Symphony Society, and Washington University, of whose corporation he was president from 1897 to 1928. In the latter capacity, not only through gifts from his own fortune, but by his success in interesting citizens of St. Louis in contributing the necessary funds, he practically refounded the university, transferring it to a new site of more than 160 acres, erecting new buildings of the highest class and equipment, and raising the endowment to more than \$12,000,000. He erected and equipped also during 1913-14 all the buildings of the reorganized medical school of Washington University, placing this school and its group of hospital buildings in the front rank of institutions of its kind in the United States.

During the World War Mr. Brookings was a member of the War Industries Board, serving as commissioner of finished products. He was made also a member of the Allied Purchasing Commission and chairman of the Price Fixing Committee, which determined what the Allies should pay for all war purchases in the United States, with the exception of food and fuel. In 1919 he was a member of the Capital and Labor Commission appointed by President Wilson. His experiences during the war convinced him that there was need for constructive aid in the development of sound national policies, and to this end he founded in 1918 at Washington the Institute for Government Research. He next founded in 1922, with the aid of the Carnegie Corporation of New York, the Institute of Economics, which was to consist of a permanent body of trained experts to study the world's basic economic problems, and in 1924, with the aid of the Laura Spelman Rockefeller Memorial Foundation, George Eastman, and others, the Robert Brookings Graduate School in Economics and Government, whose purpose was to offer training of a super-graduate character to students of the social sciences. These three institutions were merged in 1927 into the Brookings Institution (q.v.), of whose board of trustees Mr. Brookings was made chairman. He was also a trustee of the Carnegie Institution of Washington and the Carnegie Endowment for International Peace and was a regent of the Smithsonian Institution. In addition to receiving the Distin-

guished Service Medal for his war services he was made an officer of the French Legion of Honor and a commander of the Order of the Crown of Italy. In 1925 he was made honorary adviser to the U. S. Army Industrial College. He was the author of *Industrial Ownership* (1925); *Economic Democracy* (1929); and *A Suggested Evolution of Capitalism* (1930).

**BROOKINGS INSTITUTION.** An organization devoted to public service through research and training in the social sciences, established in Washington, D. C., in 1927. Its purposes are: to aid constructively in the development of sound national policies, and to offer training of a super-graduate character to students of the social sciences. It maintains, as operating units, the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had two years of graduate work are accepted as research fellows. It provides also headquarters for visiting scholars who come to the national capital to make use of the material available there on economic, political, historical, social, administrative, and legal problems, as found in library collections and in the records of the various government departments.

By charter provision the investigations of the institution are conducted "without regard to the special interests of any group in the body politic, whether political, social, or economic." During 1932 the following studies were published: *The Society of Nations: Its Organization and Constitutional Development*; *War Debts and World Prosperity*; *Bankers' Profits from German Loans*; *Credit Policies of the Federal Reserve System*; *Advertising Allowances*; *A Phase of the Price-Making Process*; *Unemployment Insurance in Austria*; *State Centralization in North Carolina*; *The Federal Radio Commission*.

The institution is supported from endowment funds and annual grants. The board of trustees, a self-perpetuating body, has general responsibility for determining the institution's policies and its programme of work, but does not assume responsibility for each particular investigation. The officers of the board of trustees for 1931-32 were: chairman, Robert S. Brookings (q.v.), founder of the institution; vice chairman, Leo S. Rowe; treasurer, Frederic A. Delano; and president, Harold G. Moulton. Headquarters are at 722 Jackson Place, Washington, D. C.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution in Brooklyn, N. Y., composed of four divisions—education, museum of arts and sciences, children's museum, and a botanic garden. It was founded in 1824 and incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The education division is divided into the following departments, composed of members interested in a particular field: Agriculture, astronomy, botany, dramatic art, electricity, fine arts, geography, geology, music, pedagogy, philology, philosophy, photography, physics, political science, psychology, and sociology. These departments conduct courses and sponsor addresses, lectures, and concerts. A forum conducted by the departments of political science and sociology provides for the discussion of current problems. The enrollment in the school of pedagogy in 1932 was 2240, with an attendance at lectures of 320,149.

The institute's museums contain collections in

the fields of art, ethnology, and natural science; its botanic garden comprises more than 50 acres. Attendance at the museums during the year was 1,313,186 and at the botanic garden, 1,101,876. The library contains more than 27,000 volumes. In 1932 the permanent funds of the institute amounted to \$3,380,885; the funds to meet current expenses totaled \$890,245. The president of the board of trustees was Edward C. Blum; director of the division of education, Charles D. Atkins; of the museum of arts and sciences, William Henry Fox; of the children's museum, Anna B. Gallup; and of the botanic garden, C. Stuart Gager. Headquarters are at Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

**BROOKLYN MUSEUM.** See ART EXHIBITIONS.

**BROWN, JOSEPH MACKEY.** An American railroad executive and politician, died in Marietta, Ga., Mar. 3, 1932. He was born in Canton, Ga., Dec. 28, 1851, and was graduated from Oglethorpe University in 1872. In 1877 he entered the service of the Western and Atlantic Railroad Co. and advanced through various positions to traffic manager in 1889. He retired from that field in 1898 to enter politics. In 1904 he was appointed a member of the State Railroad Commission but was dismissed by Gov. Hoke Smith three years later. The Legislature had increased this commission from three to five members so as to secure a majority that was not dominated by railroad interests. In the primaries of June, 1908, however, Mr. Brown, supported by the business and railroad interests of the State won the gubernatorial nomination over Governor Smith (which in Georgia is equivalent to election). The panic of 1907 and the ensuing "hard times" also had caused a reversion in political sentiment; popular campaign slogans were "Hoke and Hunger," "Brown and Bread." Governor Brown was returned to office a second time in December, 1911, following Hoke Smith's election to the U. S. Senate to fill the unexpired term of A. S. Clay. The Democratic party in Georgia, however, continued to be dominated by the rival Smith and Brown factions until their reconciliation in the national campaign of 1928. Mr. Brown wrote: *The Mountain Campaigns in Georgia* (1886); *Kennesaw's Bombardment or How the Sharpshooters Woke Up the Batteries* (1890); and *Astyanax* (1906).

**BRYAN UNIVERSITY.** An institution of higher education in Providence, R. I., founded in 1764. It consists of an undergraduate college for men, including a division of engineering; Pembroke College for undergraduate women; the graduate school; and the division of university extension. The enrollment in the autumn of 1932 was 1289 undergraduate men, 490 undergraduate women in Pembroke College, 322 graduate students, and 58 special students in education. The faculty consists of 229 members, including 121 professors, 50 instructors, 7 lecturers, and 51 assistants. Among the new appointees were: Albert J. Farmer, visiting professor of French; Lawrence C. Wroth, research professor in American history; Hans Kurath, professor of German and general linguistics; Carel J. Smit, assistant professor of economics (for research); George E. Downing, assistant professor of art. The productive fund of the University on June 30, 1932, was \$10,404,525. The total income from these funds was \$505,025. The libraries contained approximately 460,000 volumes, including the fol-

lowing special collections: John Carter Brown Library of Americana, the Harris Collection of American Poetry, the McLellan Lincoln Collection, the Hoffman Napoleon Collection, the Rider Collection of Rhode Island History, the Wheaton Collection of International Law and the Mathematics Library. Enlarged and improved facilities have been provided for the department of art, its programme of courses has been expanded through cooperation with the Rhode Island School of Design, and a community programme in art has been undertaken with special funds provided for the purpose. A programme of courses in general linguistics has been added to the work of the several departments of languages and literatures. A special research project on the international gold standard was inaugurated by the department of economics with the aid of special funds given for the purpose. The headquarters of the Linguistic Atlas of the United States and Canada has been established at Brown University. President, Clarence Augustus Barbour, D.D., S.T.D., LL.D.

**BRUNEI, brōō-nī'.** A British protectorate on the northwestern coast of the island of Borneo (q.v.). Area, about 2500 square miles; population, 1931 census, 30,162 (60 Europeans). Brunei, the chief town, has about 12,000 inhabitants. Mangrove extract, rubber, sago, and jelutong are the chief products. Revenue in 1931 totaled £39,901; expenditure, £37,659; public debt, £40,083. Exports in 1931 were £58,508; imports, £255,910. Sultan in 1932, Ahmed Tajudin Akhazul Khairi Waddin, a minor, who receives an annual allowance of £1400 from state funds. Government is administered by the British resident. Resident in 1932, T. F. Carey.

**BRUNSWICK, brūnz'wīk.** A state of the German Republic. See GERMANY under *Area and Population*.

**BRYANT, HENRY GRIER.** An American explorer and geographer, died in Philadelphia, Pa., Dec. 7, 1932. He was born in Allegheny, Pa., Nov. 7, 1859, and was graduated from Princeton University in 1883 and with the LL.B. degree from the University of Pennsylvania in 1886. In 1891 he explored the Grand Falls of Labrador and the following year was second in command of the Peary Relief Expedition to Greenland. In 1894 he commanded the Peary Auxiliary Expedition in which well-known men of science participated and which gave opportunity for fruitful researches as to glacial and other Arctic phenomena. He was in charge in 1897 of the expedition to Mt. St. Elias in Alaska. He explored also the St. Augustine River in Labrador in 1912 and made mountain ascents in the Canadian Rockies and other parts of the world. For various terms during 1897-1932 he served as president of the Geographical Society of Philadelphia and also as president of the American Alpine Club in 1911-13 and of the Association of American Geographers in 1913. He was elected a Fellow of the Royal Geographical Society (British) and was a corresponding member of Swedish and Swiss geographical and anthropological societies.

**BRYN MAWR COLLEGE.** An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1932 totaled 481. The teaching staff numbered 82. The productive funds of the college amounted to \$5,960,870 in the autumn of 1932 and the receipts for the year 1931-32 were \$832,505. The number of volumes in the

library was 140,000. President, Marion Edwards Park, Ph.D., LL.D.

**BUCKNELL UNIVERSITY.** A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1932 the enrollment was 1016, of whom 602 were men and 354 women. Of the 435 students enrolled in the summer session of 1932, 272 were men and 153 were women. The faculty numbered 78. The productive funds amounted to \$1,700,000 and the income for the year was \$700,000. The library contained 60,000 bound volumes. President, Homer Price Rainey, Ph.D., LL.D.

**BUCKWHEAT.** The buckwheat crop of the United States in 1932 according to estimates published by the Department of Agriculture amounted to 6,844,000 bushels produced on 464,000 acres, the average yield per acre being 14.8 bushels. The yield in 1931 was 8,890,000 bushels, the area 505,000 acres and the average yield per acre 17.6 bushels. The buckwheat acreage during recent years has been on the decline. Among the 23 States reporting buckwheat production the yields of the leading States were as follows: New York 2,458,000 bushels, Pennsylvania 2,070,000 bushels, West Virginia 315,000 bushels, and Maine 273,000 bushels. New York and Pennsylvania produced about two-thirds of the entire crop of the country. The average yield per acre of the reporting States ranged from 5 bushels in North Dakota to 22 bushels in Vermont. The northeastern States reported the higher yields. During the fiscal year ended June 30, 1932, the exports of buckwheat were 524,000 bushels as compared with only 85,000 in the preceding fiscal year.

In the United States the buckwheat crop is used mainly for griddle cakes which are made either from straight or mixed flour. A small part of the crop is milled into groats which furnish material used in soups, as porridge and as breakfast foods. Of the by-products the middlings have the greatest feeding value especially when fed with other suitable protein feeds to dairy cattle and swine. In feeding experiments the middlings have been found to give as good results as linseed meal or cottonseed meal when used as part of the protein mixture.

**BUDGET.** See STATISTICS; PUBLIC FINANCE.

**BUFFALO, THE UNIVERSITY OF.** A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846 under a charter received from the State Legislature. The enrollment for the autumn of 1932 was distributed as follows: college of arts and sciences, 745; school of law, 204; school of dentistry, 131; school of medicine, 286; school of pharmacy, 123; school of business administration, 196; University of Buffalo evening session, 1782. The enrollment for the 1932 summer session was 788. The faculty numbered 447 in the autumn of 1932. The library contained 89,170 volumes and 84,000 pamphlets. Chancellor, Samuel P. Capen, Ph.D., L.H.D., Sc.D., LL.D.

**BUGS.** See ENTOMOLOGY, ECONOMIC.

**BUILDING.** The value of the buildings for which permits were granted in 215 cities in the United States suffered an almost inconceivable deflation in 1932 and, according to *Bradstreet's* annual summary, dropped to a total but slightly higher than the war-time restricted figure of \$374,081,000 in 1918. The total in these cities was \$399,288,930 in 1932, or a decline of 65½

per cent from 1931, of 76 per cent from 1930, and of 86 per cent from 1929. In no month of the year did the total in the value of building permits issued in 120 identical cities rise to the lowest month's level in 1931. The peak, in May, of \$37,894,000 was slightly higher than the total for January; but the slight flurry of activity immediately subsided, and the succeeding months showed little fluctuation. The low ebb was reached in December, when permits to the value of \$20,066,000 were issued. At no time since 1911, except during the three closing months of 1918, were lower figures recorded for any month of any year.

The cause of the great decline in building operations is readily interpreted. Notwithstanding lower costs of building in labor and materials, municipal taxes have shown no appreciable reduction. The real estate market was at a standstill during the year, with few transactions. Buyers were not attracted by any prices; and with a falling market, mortgage loans were difficult to negotiate. In the field of residence buildings, the normal development induced by an increasing population was offset by the continued unemployment and the consequent doubling-up of families. In the office- or factory-building field, the high percentage of vacant space in the one and the idleness or semi-idleness in the other were not conducive to the erection of competitive structures. In New York City, according to *Bradstreet's*, the permits for the entire 12 months of 1932 amounted to \$78,183,889 as against \$355,737,349 in 1931, or a decline of 78 per cent. Outside of New York City the total permits aggregated \$321,105,041 as against \$803,225,924 in 1931, or a decline of 60 per cent. In 14 cities of Canada building permits totaled \$34,800,110 as against \$88,885,602 in 1931, a decline of 55 per cent.

The normal depreciation of property, and the measure of price stability attained in building construction during the latter months of the year, were the bases of an estimate by *Bradstreet's* for a moderate optimism in future operations.

The following table gives the building permit values of 120 identical American cities over the period of years from 1911 to 1932:

Year	Value	Year	Value
1932 . . . . .	\$ 336,318,000	1921 . . . . .	\$1,493,464,000
1931 . . . . .	1,005,626,000	1920 . . . . .	1,255,808,000
1930 . . . . .	1,407,833,000	1919 . . . . .	1,181,251,000
1929 . . . . .	2,489,553,000	1918 . . . . .	374,081,000
1928 . . . . .	2,795,229,000	1917 . . . . .	641,100,000
1927 . . . . .	2,870,512,000	1916 . . . . .	926,647,000
1926 . . . . .	3,230,414,000	1915 . . . . .	770,010,000
1925 . . . . .	3,386,043,000	1914 . . . . .	734,519,000
1924 . . . . .	2,907,529,000	1913 . . . . .	808,069,000
1923 . . . . .	2,832,439,000	1912 . . . . .	877,924,000
1922 . . . . .	2,811,915,000	1911 . . . . .	821,717,000

In a grouping of 215 American cities by sections, the Middle Atlantic section, comprising the States of New York, New Jersey, Pennsylvania, Delaware, and Maryland, showed the greatest percentage of decline for the year, dropping from an aggregate of \$500,798,593 in 1931 to \$134,374,448 in 1932, a decline of 73 per cent. The least affected section of the country was the South Atlantic, showing a loss of 40 per cent, or a drop from \$82,622,936 in 1931 to \$44,863,964 in 1932. The accompanying tabulation covers the eight sections:

**BUILDING PERMITS IN THE UNITED STATES  
FOR 215 CITIES, 1931-1932**  
[From *Bradstreet's*]

	1932	1931	Change per cent
New England ..	\$ 34,424,759	\$ 33,580,964	-88.2
Middle Atlantic ..	134,374,448	500,798,593	-78.2
South Atlantic ..	44,868,964	82,622,936	-46.3
East Central ....	59,234,144	184,969,760	-68.0
South Central ...	31,777,864	87,982,407	-63.9
West Central ....	27,288,952	71,210,585	-61.7
Mountain .....	5,521,810	14,125,707	-60.9
Pacific .....	61,802,889	123,672,301	-50.0
Total U. S. .	399,288,980	1,158,963,273	-65.5
New York City ..	78,183,889	355,737,349	-78.0
Outside New York City .....	321,105,041	803,225,924	-60.0
Canada (14 cities)	39,800,110	88,885,602	-55.2

The summary of heavy engineering construction compiled by the *Engineering News-Record*, New York, for the year 1932, showed a total of private and public (including Federal) engineering contracts amounting to \$1,219,309,000 as compared with \$2,432,314,000 in 1931, or a drop of almost 50 per cent in money value. But since lower construction costs prevailed throughout the year than through the preceding year, the figures do not accurately indicate the comparative decrease in construction work in the two years. The *Engineering News-Record Cost Index* for the

year 1931 averaged 181.35 as compared with 150.97 for 1932, or an average drop in costs of 13.4 per cent. Public works in all classifications, except that of earthworks and waterways, declined during the year, the total being \$898,885,000 as against \$1,396,310,000 for 1931, or a drop of 35.6 per cent in money value. Private construction contracts for the year fell off to a more marked extent, the aggregate amounting to \$320,424,000 as against \$1,036,004,000 in 1931, or a monetary decline of 69 per cent. New England and the Middle Atlantic States showed the greatest percentages of decline, the aggregate contracts for both public and private construction in these two groups being \$475,466,000 in 1932 as against \$1,154,594,000 in 1931, or a drop of almost 59 per cent. The accompanying table gives construction by classes and geographical divisions as compiled by *Engineering News-Record* in millions of dollars.

Contracts for all classes of construction in the 37 States east of the Rocky Mountains, according to the Dodge Statistical Research Service and compiled by the F. W. Dodge Corporation, showed a greater decline in values for 1932 than for the previous year—a drop from \$4,523,114,600 in 1930, to \$3,092,849,500 in 1931, and to \$1,351,158,700 in 1932. The contract records cover a total of 76,129 projects involving a total of 155,575,400 square feet, and include various types

**CONTRACTS AWARDED BY TERRITORIES—YEAR 1932**  
[F. W. Dodge Corporation]

Territory	Residential building	Non-residential building	Public works and utilities	Total construction
New England .....	\$ 38,771,000	\$ 43,010,800	\$ 32,271,300	\$ 114,053,100

#### INDIAN DELEGATES TO THE IMPERIAL ECONOMIC CONFERENCE OTTAWA CANADA

Left to Right (Front Row) Sir Padamji Pestonji Ginzala, the Begum Haroon, Lady Chatterjee, Lady Smyth, Miss Doulat Haroon (Back Row) Sir Atul Chatterjee, behind the Begum Haroon, Saherzada Abdussamad Khan, Yusoff Haroon, R.C.K.S. Chetty, M.L.A., Seth Hapi Abdoola Haroon, and two advisers to the Indian delegation

Wide World

#### IMPERIAL ECONOMIC CONFERENCE, OTTAWA, CANADA

Rt Hon R. B. Bennett, Prime Minister of Canada and Chairman of the Conference signing the final papers at the final plenary session

Saint-Antoine, Oise, Feb. 16, 1932. He was born in Paris, Dec. 20, 1841, and attended the Lycée Bonaparte in Paris and the Collège d'Argentan. In 1871 he was appointed inspector of elementary schools in Paris by Jules Simon, then Minister of Public Instruction. His nomination was bitterly attacked, more particularly by Dupanloup, Bishop of Orleans, who denounced, in the National Assembly, several pamphlets published by Buisson in which he recommended the exclusion from the schools of all moral instruction not purely secular, and the omission of sacred history from the curriculum for the younger pupils. Compelled to resign, Buisson was afterward appointed commissioner, in charge of public instruction, to the expositions held in Vienna (1873) and Philadelphia (1876). In 1878 he became chief inspector of elementary education, and in the following year Jules Ferry appointed him director of that department in the Ministry of Public Instruction. The introduction of new educational methods in the elementary schools under his jurisdiction had been remarkably rapid. On his resignation in 1896 he was appointed professor of pedagogy at the Sorbonne.

In 1902 Buisson entered politics, representing the Department of the Seine in the Chamber of Deputies until 1914. He served again from 1919 to 1923 as Socialist deputy from the third district of Paris. From 1916 to 1926 he was president of the League of the Rights of Man, and at the time of his death was honorary president of that organization. In 1927, with Prof. Ludwig Quide of the University of Munich, he received the Nobel Peace Prize in recognition of his efforts as "the world's most persistent pacifist." His most important works are *Dictionnaire de pédagogie* (6 vol., 1882-1893) and *Nouveau dictionnaire de pédagogie* (1911). Also he was the author of *Le Vote des femmes* (1910); *La Foi laïque* (1912); and *Le Fond religieux de la morale laïque* (1919).

**BULGARIA.** A constitutional monarchy in the Balkans lying to the south of Rumania, east of Yugoslavia, and north of Greece and European Turkey. Capital, Sofia; reigning King in 1932, Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918.

**AREA AND POPULATION.** As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The population according to the census of 1926 was 5,478,741, as compared with the 1920 census population of 4,846,971. The estimated population on June 30, 1931, was 6,006,000 (79.3 per cent rural and 20.7 per cent urban). The chief cities, with their populations at the 1926 census, are: Sofia, 213,002; Philippopolis (Plovdiv), 84,655; Varna, 60,563; Ruschuk (Ruse), 45,788. About 81 per cent of the population is Bulgarian and 10.5 per cent Turkish. According to preliminary figures, the movement of population in 1930 was: Births, 179,964; deaths, 92,693; marriages, 54,387. The national faith is that of the Orthodox Church, with some 789,000 Moslems composing the largest religious minority.

**EDUCATION.** Elementary education is free and compulsory for children between the ages of 7 and 14. In 1929-30, 600,219 pupils were enrolled in elementary schools, public and private; 150,628 in secondary schools; 28,870 in special and professional schools; and 6400 in Universities. The State University at Sofia had 354 teachers and 5031 students.

**PRODUCTION.** The cultivated land, totaling about 9,182,000 acres, is widely distributed among small proprietors and supports 80 per cent of the population. About 7,203,160 acres are forested. Yields of the chief crops, in metric tons, in 1931, with 1930 figures in parentheses, were: Wheat, 1,605,476 (1,559,938); rye, 306,637 (320,571); barley, 360,550 (432,587); oats, 124,909 (110,550); and corn, 997,148 (775,108). The 1931 figures are provisional. Other products included mixed grain, potatoes, tobacco, grapes (69,345,000 gallons of must in 1930), sugar beets, sunflower seed, attar of roses, fruit, cotton, and silk cocoons. Livestock in 1926 included 8,739,803 sheep, 1,817,437 cattle, 1,002,089 swine, and 482,180 horses.

Industry is relatively unimportant, the principal lines being leather, wood and furniture, ceramics, and woolen textiles. On Jan. 1, 1930, the government was subsidizing 1158 manufacturing industries. There are several state monopolies, of which the manufacture of tobacco is the most important. Coal production in 1930 was 1,593,041 metric tons (1,517,100 in 1931); copper, 27,448 metric tons (31,370 in 1929); zinc-lead, 2762 (11,396); lead-copper, 9737 (9923); aluminum, 5747 (3613); and salt, 1704 (3653).

**COMMERCE.** While Bulgarian exports in 1931 declined to 5,934,174,000 leva from 6,191,140,000 leva in 1930, imports increased slightly to 4,660,063,000 leva from 4,589,725,000 leva in the previous year (the lev exchanged at par of \$0.0072 in 1930 and 1931). The favorable trade balance was 1,274,111,000 leva, as against 1,601,415,000 leva in 1930. The leading exports in 1931 (in 1000 leva), with 1930 figures in parentheses, were: Tobacco, 2,579,730 (2,654,238); eggs, 849,990 (887,282); corn, 295,102 (537,870); attar of roses, 85,095 (194,402). The principal imports (in 1000 leva) were: textiles, 1,472,811 (1,271,518); metals, 909,642 (777,920); machinery, 604,180 (649,988); skins, 211,264 (159,292); resin and mineral oils, 170,984 (273,225). Germany was the chief source of imports, supplying 1,084,194,000 leva of the 1931 total, followed by Italy, the United Kingdom, Czechoslovakia, Austria, France, and Rumania, in the order named. Exports went principally to Germany, Austria, Belgium, Italy, Switzerland, and Czechoslovakia in the order named.

Exports for 1932 were valued at 3,384,082,000 leva and imports at 3,471,507,000 leva, leaving an unfavorable trade balance of 87,425,000 leva. Exports declined 55 per cent and imports 25 per cent, as compared with 1931 values.

**FINANCES.** Budget estimates for the year ended Mar. 31, 1932, placed revenue at 6,400,000,000 leva, including 2,460,000,000 leva from indirect taxation, and expenditure at the same figure, including 2,150,000,000 leva for public debt charges. Preliminary returns for the year showed a deficit of about 900,000,000 leva, as compared with a deficit of 1,284,000,000 leva for the 1930-31 fiscal year. The proposed budget for 1932-33, as submitted to Parliament in April, 1932, placed receipts and expenditures at 6,000,000,000 leva, a figure recommended by the Financial Committee of the League of Nations.

The national debt on Dec. 31, 1931, stood at 27,226,000,000 leva (26,795,000,000 leva, when loans on account of certain Departments are deducted). The total was divided into foreign debt, 20,998,000,000 leva (consolidated, 15,772,000,000; reparations, 4,641,000,000; floating,

585,000,000), and internal debt, 6,228,000,000 leva (consolidated, 2,516,000,000; floating, 3,712,000,000). See *History*.

**COMMUNICATIONS.** Bulgaria in 1930 had 1821 miles of railways (1515 miles of ordinary gauge and 306 miles of narrow gauge), all state owned and operated; 10,026 miles of highways, including 4687 miles of state roads; 1397 miles of non-railway telegraph lines; and 8349 miles of telephone lines. In the same year 5953 vessels of 1,973,728 tons entered the Black Sea ports and 5963 of 1,976,464 cleared. Vessels entering the Danube ports numbered 11,417 of 2,311,054 tons; vessels clearing, 11,470, of 2,332,621 tons.

**GOVERNMENT.** Under the Constitution of 1879, as amended in 1893 and 1911, the King is the executive authority and is assisted by a Council of Ministers nominated by him. Legislative power rests with the *Sobranie*, or National Assembly, a single chamber of 227 members elected for four years by proportional representation. Laws passed by the *Sobranie* require the King's assent and he may dissolve it at any time. The composition of the *Sobranie* elected June 21, 1931, was: National Bloc, 162 (including 72 Agrarians, 42 Democrats, 29 National Liberals, 7 Radicals, and 2 others); Democratic Entente (*Liapcheff* group), 64; Labor (formerly Communist), 31; National Liberal (*Smiloff* group), 14; Macedonian group, 8; Social Democratic, 5; total, 274. The Cabinet as reorganized Oct. 12, 1931, included: Premier and Minister for Foreign Affairs and Public Worship, Nicholas Mushanoff (Democrat); Minister of Interior, Dr. Alexander Ghirghinoff (Democrat); Education, Constantine Muravieff (Agrarian); Justice, Dimitri Varbenoff (National Liberal); Commerce, Gheorgi Petroff (National Liberal); Finance, Stephen Stephanoff (Democrat); Public Works, Gheorgi Yordanoff (Agrarian); Posts and Railways, Stoian Kosturkoff (Radical); Agriculture, Dimitri Ghitcheff (Agrarian); War, General Kissioff.

### HISTORY

**THE FINANCIAL CRISIS.** As in other Balkan states, the economic and financial problems arising from the depression took precedence over all other issues during 1932. The acuteness of the situation at the beginning of the year was indicated by the fact that Bulgaria had a foreign exchange surplus of only 100,000,000 leva monthly with which to meet foreign debt and reparation charges aggregating 91,000,000 leva in addition to payments on an outstanding debt of 1,300,000,000 leva for goods purchased abroad. With the continued decline in exports, the impossibility of continuing full payments on these foreign obligations became obvious. On January 8 Premier Mushanoff indicated the approaching necessity of default, unless aid was obtained from outside sources. This was followed by the announcement of Minister of Agriculture Ghitcheff on February 8 that under no circumstances would Bulgaria make further reparation payments.

In response to frantic appeals, the Financial Committee of the League of Nations sent three representatives to Bulgaria to study the situation. The findings of the commission, made public on February 13, were in sharp contrast to the pessimistic statements of government officials. It found the lev stable, the private banks liquid, and a 37 per cent currency coverage. Due chiefly to the foreign exchange restrictions of Bulgaria's

neighbors, the commission recommended that from April to September a moratorium should be declared on 50 per cent of the interest and sinking-fund payments due abroad. It suggested that the payments withheld be deposited in a blocked account in the National Bank, recommended the continuation of the Hoover moratorium on Bulgaria's reparation payments, and urged that the government balance the budget by September.

Premier Mushanoff accepted these recommendations, with modifications. The budget for 1932-33 was tentatively balanced (see *Finance*). And on April 15 he notified the League Council that, beginning April 1, the government was suspending the transfer of 60 per cent of the country's foreign debt service, instead of the 50 per cent suggested. At the same time, the government requested the trustees of its foreign loans to form a committee of the bondholders to negotiate with it regarding the future service of the loans.

Under pressure of the Agrarian party, the ministry also took steps in March to relieve the critical financial straits of many peasants by suspending until Nov. 1, 1932, all forced sales for taxes. It further sponsored a plan to convert the debts of farmers up to \$1000 into long-term obligations. The Agrarians, however, remained dissatisfied with the policies of Minister of Agriculture and Public Works Yordanoff, who refused their insistent demands that he resign voluntarily. This conflict precipitated the resignation of Premier Mushanoff and the entire cabinet on September 7. A new cabinet was immediately formed by Premier Mushanoff, with the same personnel except that Virgule Dimoff, general secretary of the Agrarian party, replaced Yordanoff. Another cabinet crisis was precipitated December 27, when the three Agrarian members of the ministry resigned because their colleagues rejected their proposals for economic and financial reforms. The following day Premier Mushanoff presented the resignation of the entire cabinet to the King. On December 31, M. Mushanoff formed a new cabinet, with himself as Premier and Minister of Foreign Affairs. Lacking the support of the National Liberals, the new ministry was without a parliamentary majority and it was expected to be short-lived.

The possibility of a military dictatorship in Bulgaria developed during the year as a result of the rapid gains made by the Communist party, which captured a majority in the Sofia Council, and the widespread discontent among the peasants. General Sirmanoff, head of the Reserve Officers' Union, warned the political leaders that unless bolshevism and political bickering were checked the officers would "step over" the political parties "to save the country." The 31 Communist Deputies were thrown out of the Parliament building October 28 after they had prevented King Boris from delivering the speech from the throne by shouting "Down with the Fascist government."

Like Germany, Bulgaria in 1932 showed increasing restiveness under the restraints imposed by the peace treaties. Besides demanding the cessation of reparation payments, the government sought at the Disarmament Conference in Geneva (see *DISARMAMENT*) to secure the restoration of compulsory military service. The ostensible reason given was that conscription was less expensive than the small professional army permitted under the Treaty of Neuilly.

**BULTFONTEINITE.** See MINERALOGY.

**BURIAT-MONGOL REPUBLIC.** See SIBERIA.

**BURGESS, GEORGE KIMBALL.** An American physicist, died in Washington, D. C., July 2, 1932. He was born in Newton, Mass., Jan. 4, 1874, and was graduated in 1896 from the Massachusetts Institute of Technology, where for two years he served as assistant in physics. He then studied at the University of Paris, receiving the Sc.D. degree in 1901. On his return to the United States he taught physics at the Universities of Michigan and California. In 1903 he went to Washington as associate physicist of the Bureau of Standards, and in 1913 became physicist and chief of the division of metallurgy. In 1923 he succeeded Dr. S. W. Stratton as director of the bureau. During the World War he served as member of various commissions of the National Research Council that cooperated with scientists in the Allied countries in the study of various problems arising in connection with the war. He was also chairman of the Federal Fire Council, director of the American Engineering Standards Association, and U. S. delegate to the International Conference on Weights and Measures held in Paris in 1927 and to the World Engineering Congress held in Tokyo in 1929. The results of his many investigations were published in a series of papers on the constant of gravitation, on high-temperature measurements, and on the properties of metals and alloys. Besides translating *Le Châtelier's High Temperature Measurements* (1901) and *Duhem's Thermodynamics and Chemistry* (1903) he wrote *Recherches sur la constante de gravitation* (1901); *Experimental Physics—Freshman Course* (1902); *The Measurement of High Temperatures* (with H. Le Châtelier (1911); *A Micropyrometer* (1913).

**BURMA.** The largest and most easterly Province of British India. Burma has an area of 262,732 square miles, or approximately the size of Texas. The Province is divided into Burma proper, 184,102 square miles; the Shan States, 62,305 square miles; and 16,325 square miles of unadministered territory. Capital, Rangoon.

The population, census of 1931, totaled 14,667,146. Burmans are of the Mongoloid race group and are overwhelmingly Buddhist; they have little in common with the people of India proper in language, race, or religion. Rangoon, with 400,415 inhabitants, and Mandalay, with 147,932, are the leading cities. In 1930-31 there were 545,401 pupils in 7567 recognized schools and colleges, and 192,866 pupils in unrecognized institutions. There is a university at Rangoon, an agricultural college and research institute and also an intermediate college at Mandalay, a forestry school at Pyawmna, and a technical institute and a veterinary school at Insein.

**PRODUCTION.** Agriculture is the principal occupation, supporting 9,159,000 out of the total population. Four-fifths of the total cultivated area of some 17,000,000 acres is under rice, which is the chief money crop of the people, forming 83 per cent of the exports by value in 1930. The decline in the price of unmilled rice from 160 rupees (1 rupee averaged \$0.3369 in 1931) per 100 baskets in 1930 to 65 rupees per 100 baskets in July, 1931, greatly reduced the purchasing power of the people and trade and industry were drastically restricted. There are about 20,000,000 acres of forest land, which yield ap-

proximately 1,000,000 tons of timber annually, half of it teak. In 1929 the teak output was 478,518 tons; other woods, 570,173 tons. Petroleum production in 1929 totaled 253,000,000 Imperial gallons (262,187,263 gallons in 1928). Tin, tungsten, silver, lead, zinc, and wolfram are mined. Factories in 1930 numbered 948, principally rice mills and sawmills, and employed nearly 100,000 persons.

**COMMERCE.** For the fiscal year ended Mar. 31, 1931, imports of foreign merchandise (excluding the coastal trade with India proper) declined to the equivalent of \$50,185,097 from \$76,160,268 in the previous fiscal year. Exports declined in value to \$117,434,064 from \$143,819,793 in 1929-30. The United States in 1930-31 supplied \$5,470,620 of imports (\$6,748,850 in 1929-30) and purchased \$1,634,470 of exports (\$1,953,115). In the fiscal year 1931-32, trade showed even more drastic declines. Rice is the leading export and cotton piece goods the chief import.

**FINANCE.** For the fiscal year 1930-31, revised estimates for revenue were 1010 lakhs (1 lakh = 100,000 rupees; 1 rupee = \$0.3369 in 1931) and for expenditure 1109 lakhs. Burma made no contribution to the central government of India in 1930-31.

**COMMUNICATIONS.** Due to the rugged northern and eastern frontiers, communication with India and the outside world is entirely by water. About 98 per cent of Burma's imports and 85 per cent of its exports pass through Rangoon, situated 20 miles from the sea on the Rangoon River. In 1930-31, a total of 1811 steamers of 4,419,000 net tons entered the port, unloading 1,551,329 tons of goods and loading 3,677,542 tons of Burmese products. The Irrawaddy River is navigable for 900 miles and forms the main highway of commerce. In 1930-31 there were 2057 miles of state-owned railway lines. Surfaced highways extended 1741 miles; unsurfaced, 7822 miles.

**GOVERNMENT.** In 1923, Burma was constituted a Governor's Province under the Government of India Act of 1919. There is an appointive executive council and a legislative assembly of 103 members, of whom 80 are elected and 23 nominated and *ex-officio*. The Shan States are administered by the local chiefs under supervision of the Commissioner of the Federated Shan States. Governor, Sir Hugh L. Stephenson who succeeded Sir Charles Innes on Dec. 20, 1932.

**HISTORY.** The Round-Table Conference on Burma, which convened in London, Nov. 27, 1931, closed on Jan. 12, 1932. Substantial agreement had been reached between the British and Burman representatives regarding a proposed Constitution under which Burma would be separated from India and given a larger measure of autonomy. The provisional settlement presupposed that a substantial majority of the Burmans favored withdrawal from the projected Indian federation (see INDIA under *History*).

Meeting no such racial, caste, and religious divisions as those which held up an Indian settlement, the Burma conference envisaged new elections in November, 1932, followed by the establishment in 1933 of a new constitutional régime. The projected Constitution called for a bi-cameral legislature, with a senate of about 40 members, partly elected and partly nominated, and an elected assembly three times as large. The Cabinet was to be collectively responsible to the Legislature, which was to control virtually

all branches of the government except defense, maintenance of the country's financial credit, guidance of the Shan States, and the protection of minorities. These latter functions were to be reserved to the British Governor.

Many Burman leaders were dissatisfied with the number and importance of the governmental functions reserved to the British rulers. In the general election of November to fill the 77 seats in the Legislature the victorious Anti-Separationist party ran on a platform calling for entrance into the Indian federation on terms permitting Burma to secede at will. It was believed that this policy would enable Burma to obtain complete autonomy sooner than would immediate separation under the proposed Burman Constitution. The Anti-Separationists won 39 seats in the Legislature, as against 29 by the Separationists and 9 by neutrals. Dr. B. A. Maw, leader of the Anti-Separationists, refused on November 17 the invitation of Governor Sir Charles Innes to form a government. He said that his party regarded the election as a verdict against separation on the basis of the Constitution offered by Great Britain and as a mandate to work for full responsible government for Burma.

**BURNS, WILLIAM JOHN.** An American detective, died in Sarasota, Fla., Apr. 14, 1932. He was born in Baltimore, Md., Oct. 19, 1861, and attended parochial and public schools in that city and Columbus, Ohio. On his father's appointment as police commissioner of Columbus he found opportunity, in an unofficial capacity, to exercise his budding talent for criminal investigation. His success in revealing the tally-sheet forgeries in Ohio in 1885 led to his appointment four years later as a member of the U. S. Secret Service. He was assigned to the headquarters in St. Louis, Mo., and from there was transferred in 1894 to Washington. One of his early convictions was that of the Costa Rican counterfeiters, De Requesons and De Costa, who in 1890, to foment a revolution in Costa Rica, undertook counterfeiting the currency of that country in the United States. He also successfully handled the Brockway and the Taylor and Bredell money counterfeiting cases and the Jacobs case of counterfeiting revenue stamps. In 1903 he resigned from the Service to take charge, at the request of Secretary of the Interior E. A. Hitchcock, of the investigation of the gigantic system of public land frauds in the West. His disclosure of the methods by which thousands upon thousands of acres of valuable lands in Washington, Oregon, and California had been systematically stolen from the United States government resulted in the prosecution and conviction of a number of Federal, State, and city officials, including, U. S. Senator John H. Mitchell of Oregon. He next investigated, with Francis J. Heney, the charges of corruption against Eugene F. Schmitz, mayor, and Abraham Ruef, political boss of San Francisco, which resulted in a sensational trial in 1907. He later played a prominent part in disclosing municipal corruption in Atlantic City and Detroit.

In 1909 Mr. Burns founded in New York City the William J. Burns National Detective Agency, with branch offices in the principal cities of the United States. This was later expanded into the William J. Burns International Detective Agency, Inc. Following the dynamiting of the Los Angeles *Times* building on Oct. 1, 1910, he tackled the most difficult assignment of his entire career.

This outrage was the climax of a seven-years' war which the National Association of Structural Iron and Bridge Workers had waged against the open shop in building trades all over the United States. The ringleaders were found to be John J. McNamara, secretary and treasurer of the structural iron and bridge workers' union, and his brother James. Their arrest and conviction, together with that of about 40 other high labor union officials, broke up one of the most vicious conspiracies in the history of the United States. In 1921 Mr. Burns returned to the service of the United States government, being appointed by Attorney General Harry S. Daugherty director of the bureau of investigation of the Department of Justice. Outstanding among the investigations which he conducted was an inquiry into the activities of the Ku Klux Klan. On his resignation four years later he resumed his connection with the Burns Detective Agency in an advisory capacity. He was the author of *The Masked War* (1913), a history of the Los Angeles *Times* dynamiting case; *The Crevice* (1915); and *The Argyle Case* (1927).

**BUSINESS REVIEW.** Pessimistic analysis alternating with better predictions featured the opening of the year 1932 in business; but it was evident, from the first, that, at best, the year must be a period of slow improvement, with gains gradually made and their continuance, or even their considerable development at any time, dependent upon the adoption of constructive national policies. The continuance of a heated Congressional campaign, up to the middle of July, and the early coming on of an election contest which proved to be unsurpassed in bitterness, soon dashed such hopes as had been entertained of regular, steady improvement. An unexpected, and rather hectic advance in stock market conditions during the middle of summer, whether caused by natural forces of reconstruction or the result of manipulation, did not apparently reflect any actual underlying change of business conditions. It was believed by some to be a long-range forecast of ultimate improvement thought perhaps to be under way in its beginning. However, developments during the later months of the year at no time justified such expectations, and the consequence was that the closing weeks of 1932 showed advance only in few rather distinct fields of effort, prominent among which were railway carloadings and power production, in both of which indexes pointed to slightly improved prospects. A spurt in textile industries during midyear, and temporarily larger employment, soon died out, leaving unemployment at peak.

The fore part of the year was deeply affected by fears of adverse Congressional action, and by expectations of receiverships, while the year throughout was marked by very low industrial earnings, some outstanding bankruptcies as notably the Kreuger failure, and by many closings of banks and other financial institutions (see article on **BANKS AND BANKING**). Inability to readjust the price level promptly and completely to changed conditions prevented not a few institutions from placing themselves in touch with the real economic position, while inability to secure readjustment of wages, as in the case of the railways, resulted in an equally adverse result with regard to others. The net outcome of these factors, so far as industrial

production was concerned, may be briefly surveyed in the accompanying table:

### INDEX OF INDUSTRIAL PRODUCTION

[Index numbers adjusted for seasonal variations, 1923-1925 average = 100]

Mos.	1924	1925	1926	1927	1928	1929	1930	1931	1932

**DISTRIBUTION.** Poor manufacturing conditions and lack of demand for goods, except in cases where supplies were totally exhausted or nearly so, made the year 1932 an unfavorable period generally, but distributive conditions, as in former years, continued to be rather better, comparatively speaking, than those that prevailed in productive enterprises. A factor that militated heavily against retail trade was furnished by the fact that consumers, who in former years had still retained a considerable volume of savings which could be applied to purchasing for their current wants, were now far less able than formerly to supply the demand that was called for

<sup>a</sup> Based throughout on figures of daily average sales—with allowance for changes from month to month in number of Saturdays and for six national holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas. Adjustment for seasonal variation makes allowance in March and April for the effects upon sales of changes in the date of Easter.

to maintain sales. Accordingly, indexes of department store sales, adjusted for seasonal variations, not only revealed a generally lower average than during the preceding year, running some 15 points lower, but despite a temporary improvement in early October, tended again downward toward the close of the twelve-month. The distributive conditions, moreover, varied considerably as between different parts of the country, and were poorer in regions where unemployment was most severe. It was again true that chain store earnings did better, and were more sustained than was true of other retail enterprises, and there was, more than ever, a difficulty on the part of independent retailers in competing with chain store enterprises in general. The accompanying table illustrates the general position of department stores.

**COMMODITY PRICES.** The marked shrinkage of commodity prices—especially of agricultural staples—which had been in process during 1931 with such disastrous results, appeared at the opening of 1932 to have been arrested. This however, was appearance only, for fresh declines developed during the latter part of the year, not only in cotton, wheat, and other fundamental articles of commerce, but in nearly every branch of agricultural produce, and the movement extended itself also to metals and other raw materials. Average prices were already so low at the opening of the year, that the reductions thus referred to constituted only a relatively small percentage change in the general index, and so gave to the year's operations the appearance of relative stability, as is made evident by the following table reviewing the price movement by monthly averages. The tendency toward recession became more marked toward the close of the year, but it is only when the prices of particular groups of commodities are studied, that the real nature of the changes that were occurring is understood. Consumable goods succeeded in holding their own better than raw materials, by far, but in so doing rendered the consequences of the price reduction in extractive industries the more difficult to endure on the part of the operators. Retail food prices, however, showed a fair tendency to follow wholesale values through with some lag. See the accompanying table:

### MOVEMENT OF WHOLESALE PRICES

Month	1926	1927	1928	1929	1930	1931	1932

**MANUFACTURING.** During the year 1932, re-adjustment of wages and working time to meet the needs of the difficult industrial situation continued. There was no longer any pretense of keeping wages up to the 1929 standard, or of going back to a similar basis as regards various other elements of cost or outlay. Reductions of wages additional to those that had been applied during the preceding year were instituted from time to time, and rough estimates of salary reductions indicated a general cut of possibly 20

per cent below the levels of 1931. Railway wages, which had been cut 10 per cent at the close of 1931, continued to hold to their reduced figure, but at the close of 1932 another reduction of 10 per cent was asked by the executives of the principal railways, and was under consideration at the close of the period. Recognition that overhead costs of all sorts must be lessened led to new policies of manufacturing, and to an attempt to find cheaper substitutes for many articles that had previously been regarded as standard. In cases where demand seemed temporarily to brighten during the summer, as in the case of cotton textiles, advantage of the situation was taken to reduce inventory by getting rid of old stock, rather than to enlarge production which, generally speaking, continued on a rigidly controlled level. The accompanying table showing unfilled orders of the U. S. Steel corporation reflects the general indisposition to place advance orders:

UNFILLED ORDERS  
[U. S. Steel Corporation]

Month	1932	1931	1930
January ..	2,648,150	4,132,351	4,468,710
February ..	2,545,629	3,965,194	4,479,748
March ..	2,472,413	3,995,330	4,570,653
April ..	2,326,926	3,897,729	4,354,220
May ..	2,177,162	3,620,452	4,059,227
June ..	2,034,768	3,479,323	3,968,064
July ..	1,866,302	3,404,816	4,022,055
August ..	1,869,595	3,169,457	3,580,204
September ..	1,985,090	3,144,333	3,424,338
October ..	1,997,040	3,119,432	3,481,763
November ..	1,968,301	2,933,891	3,639,636
December ..	1,968,140	2,735,353	3,943,596

The low point reached by Steel's backlog earlier in the year was at the end of July when only 1,866,302 tons of unfilled orders remained on the books of the corporation. This figure represented at the time the lowest reserve of orders since the corporation was founded in 1901.

AGRICULTURE. So far as output was concerned, the agricultural year developed favorably, with a total outturn that was fully up to average in most crops. Distribution of moisture was pretty generally good, and normal yields were the rule in nearly all of the staple producing regions. Cotton produced about 13,000,000 bales, as against the unusually heavy yield of near 17,000,000 bales for the preceding year; while wheat (spring and winter) produced a total of 840,000,000 bushels. The desperately low prices for all staples had left the producer with money incomes of only 40 to 50 per cent of those of the preceding year, and in many cases without motive to ship his output at all, inasmuch as shipping charges would consume his entire income. The farmer was thus placed in exceptionally bad condition, even when his general volume of yield had been good. During midsummer, there was a brief period coinciding with the months of advance in the stock market, when a better outlook seemed to be developing. This soon faded, and the close of the year found the farmer with the lowest prices for cotton and wheat that he had received for many years past, and with an unprecedented number of defaults upon farm mortgages. The political campaign was fruitful in schemes of all sorts for raising agricultural prices and for relieving the farmer of his mortgage burdens; and the opening of Congress witnessed the development of many of them in

bill form and otherwise, pending the arrival of the new administration.

U. S. AGRICULTURAL PRODUCTION, 1932  
[000 omitted]

Product	Production	Value
Corn .....	2,908,045 bushels	\$565,611
Oats .....	1,242,037 do.	169,766

GENERAL BUSINESS. The year proved disastrous in the general business field. Dividend reductions and omissions, which had been so numerous during 1931, continued, many old-established rates of distribution being reduced or the dividend entirely passed. These were not so numerous as those of the preceding year, owing to the great inroads already made into the previously established dividend-structure, which naturally left only a smaller field within which shrinkage could operate, but the changes were the more noteworthy, because they affected enterprises which had succeeded in keeping up their payments for an unexpectedly long period. Some indeed, as a matter of general welfare, maintained dividend payments by the use of accumulated surplus on the ground that such surpluses had been laid aside in good years, in order to permit dividend maintenance in just such contingencies as the prevailing one. Corporate earnings, however, in some instances, as notably in the case of certain of the stronger railways, revealed improvement, especially toward the close of the year, largely owing to reductions of expenses and curtailment of overhead, resulting in a better net showing than had been previously the case. Still, it remained true that, save in certain of the closely controlled and monopolized industries or those enjoying an exceptionally stable demand, the results of the year were worse than for the preceding period.

BUSINESS FAILURES. In the accompanying table the failure situation prevailing during 1932 in all classes of business is depicted, following the figures furnished by *Bradstreet's* for 1932 and the preceding years. The aggregate number of failures shown is 28,773 as against a total for the preceding year of over 26,000. As during the preceding year, too, the figures indicated an exceptionally difficult situation, due to the business conditions already depicted, with the added element of danger afforded by the fact that many corporations and partnerships which had been able to "hold on," during the years after 1929 now found their receipts so heavily curtailed, and their payments so much a burden, due to a lessening volume of assets, that they recognized it as inevitable to surrender. The resulting reduction of enterprises, in not a few varieties of business, produced remarkable transformations in several important lines, and laid the foundation for a much closer control, or even monopoly, of trade for the future. It was also true that the reduction of competition in some ways aggravated conditions by rendering possible a more effective "pegging" of prices, which,

if fully availed of, must result in still further disturbing the equilibrium of the price structure, and so rendering more troublesome the variations of prices already widely noted as a factor militating against recovery.

steeply in value to \$135,960,000 (1931), from \$271,669,000 (1930). Gasoline produced from natural gas attained, for 1931, 680,339,000 gallons, as against 829,713,000 (in value \$57,974,000) for 1930. The production of natural gas

**MINERAL PRODUCTION.** Though California maintained in 1931 the second place among the petroleum-producing States of the Union, her production of petroleum declined substantially in point of quantity, to 188,830,000 barrels for

1931, from 227,329,000 for 1930, and still more for 1930 (the latest year for which totals were available) was 334,789,000 M cubic feet, as against 342,214,000 M for 1929; by value, \$69,071,000 for 1930 and \$68,972,000 for 1929. Portland cement shipped from plants in the State totaled 7,496,080 barrels for 1931 and 10,438,479 for 1930; in value, \$11,659,428 (1931) and \$15,241,089 (1930). The mining of gold, by a course natural to that industry, increased while the other mineral industries in general declined. There were mined in 1931 523,135 ounces of gold, as against 450,289 in 1930; by value, \$10,814,162 (1931) and \$9,308,300 (1930). For 1932 the gold production (Mint figures) was 566,031 ounces; by value, \$11,700,000. The production of potassium salts, in which California held the lead in the Union, was also active in 1931, providing one of the State's secondary sources of mineral extraction. The production of salt was fairly maintained, at 334,900 short tons for 1931, as against 350,370 for 1930; in value, it was \$2,000,567 for 1931 and \$2,080,133 for 1930. The mining of copper was greatly curtailed, to 8,344,901 pounds for 1931, from 26,262,447 (in value \$3,500,000 approximately) for 1930. Among the totals for products tabulated only through 1930, clay products attained for that year a value of \$16,209,437, as against \$22,733,974 for 1929. Borates were produced to the quantity of 177,360 short tons for 1930 and of 169,870 for 1929; and to the value of \$5,351,999 for 1930 and \$4,515,375 for 1929. The output of stone was, for 1930, 10,960,030 short tons, in value \$9,794,870. The total value of the State's mineral product, duplications eliminated, was \$479,049,507 for 1930; for 1929, \$555,001,213.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$77,191,832 (of which \$27,961,936 was for local education). For conducting public-service enterprises, \$1,882,646; for interest on debt, \$5,365,048; for permanent improvements, \$35,512,636; total, \$119,952,162 (of which \$32,247,108 was for highways, \$6,803,172 being for maintenance and

\$25,443,936 for construction). Revenues were \$126,249,119. Of these, property and special taxes furnished 10.1 per cent; departmental earnings and compensation to the State for officers' services, 5.8; sale of licenses, 67.6 (in which was included a gasoline sale tax that produced \$26,677,833). Funded debt outstanding on June 30, 1931, totaled \$133,583,576, of which \$59,400,000 was for highways. Net of sinking-fund assets, the debt was \$132,471,336. The State levied in the year no general ad-valorem taxes on property.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 8317.17. About 100 miles had been brought into operation in the previous year and about 23 miles abandoned.

**EDUCATION.** Heavy and widespread reductions in the budgets for public schools were reported to have been made during the year, largely through the activities of the California Tax-payers' Association. According to the *Journal* of the National Education Association, these reductions exceeded in their aggregate all retrenchment in other sorts of public expenditure within the authority of the State and its subdivisions. The number of persons of school age in the State, as of October, 1930, the latest time of available data thereon, was reported as 1,383,650. It was exceeded by the number of enrolled pupils for the academic year 1931-1932, which was 1,470,573. Of those enrolled, 784,410 were in common schools or elementary grades; in high schools, 582,097. The year's expenditure for public-school education totaled \$143,339,482.

**POLITICAL AND OTHER EVENTS.** A popular referendum was held on May 3 upon the Sharkey Act, prescribing the means to determine the quantity of petroleum that might be produced by the wells of the State under general limitation, and allocate its share of this quantity to each field and producer, through a State control board. The popular vote rejected the act, thus requiring that curtailment of the production of petroleum proceed on a basis of voluntary agreement. The State Supreme Court ruled in April that the act prohibiting the sale of the State's bonds at less than par, and likewise prohibiting sale at par less a commission, was valid. Among occurrences connected with economic depression in the State was a decision of the State Supreme Court, rendered March 1, to the effect that property taken by an irrigation district, formed under the State Irrigation District Acts, to satisfy delinquency on assessments, ranked as State property and could not be taxed by the counties.

Among the unemployed there was a revival of small-scale mining of gold, by the old primitive methods; some of the 8000 so engaged obtained a living. In some cases the bonded debt of irrigation districts that had met with adversity had to be refunded by composition. Representatives of 9000 grape growers adopted on April 25 a resolution advocating the revision of the Eighteenth Amendment in a fashion to permit the sale of naturally fermented beverages. Plans were made at San Diego to hold an international exposition from July 4, 1934, to July 4, 1935, to commemorate the city's centennial. Governor Rolph formulated in June a plan to establish employment in the offices of the State on the basis of 5 days a week, for the sake of retrenchment. Los Angeles, by municipal ordinance, adopted a like plan taking effect April 1. An effort to remove Mayor John C. Porter of Los

Angeles by a recall vote was defeated on May 3 by a margin of 50,000 votes. The tenth of the modern series of Olympic Games (q.v.) was held at Los Angeles, starting July 29, attended by some 95,000 spectators. In the August primaries William G. McAdoo gained the Democratic nomination for Senator.

The Reconstruction Finance Corporation agreed, according to announcement of October 8, to lend \$62,000,000 to the State upon the latter's bonds, for constructing the San Francisco-Oakland Bay Bridge as a self-liquidating project.

**ELECTIONS.** President Hoover's home State voted the Democratic National ticket on November 8 by a majority of over 3 to 2. The popular vote for President was officially reported as: Roosevelt (Dem.), 1,324,157; Hoover (Rep.), 847,904. For Roosevelt, it was some 700,000 greater than the Smith vote of 1929; for Hoover, some 300,000 smaller than the Hoover vote of 1928. For United States Senator, William Gibbs McAdoo, Democrat, Secretary of the Treasury under Wilson, defeated Tallant Tubbs, Republican and opponent of prohibition. By popular vote was adopted an initiated proposal to repeal the State law for the enforcement of prohibition. An initiated proposal to legalize betting on horse races was defeated. A proposal to create taxes on incomes and on sales for the special purpose of school revenues was likewise rejected.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, James Rolph, Jr.; Lieutenant-Governor, Frank F. Merriam; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, Seth E. Howard; Superintendent of Public Instruction, Vierling Kersey; Director of the Department of Agriculture, Dudley Moulton.

**Supreme Court:** Chief Justice, William H. Waste; Associate Justices, William H. Langdon, John W. Preston, Jesse W. Curtis, Emmet Seawell, John W. Shenk.

**CALIFORNIA, UNIVERSITY OF.** A coeducational institution of higher learning with headquarters at Berkeley, Calif., founded in 1868. Branches are found in various parts of the State. At Mt. Hamilton is the Lick Observatory; at San Francisco, the California School of Fine Arts, Hastings College of the Law, medical school, the George Williams Hooper Foundation, college of dentistry, California College of Pharmacy; at Los Angeles, the University of California at Los Angeles, branch of the college of agriculture in southern California, Los Angeles medical department; at Davis, branch of the college of agriculture; at Riverside, branch of the college of agriculture in southern California, including the citrus experiment station and graduate school of tropical agriculture; at La Jolla, the Scripps Institution of Oceanography.

The total number of resident students in the academic and professional departments, fall and spring sessions, 1931-32, was 20,361, of whom 10,896 were men and 9465 were women. At Berkeley 12,529 students were enrolled; at Los Angeles, 6814. The enrollment in the university extension division in 1931-32 was 28,095 in classes and correspondence courses. The 1932 summer session enrollments (Berkeley and Los Angeles) totaled 6042. At the beginning of the autumn term there were approximately 2000 members on the regular teaching staff and 800 on the extension staffs. The total income for 1931-32 was \$14,758,000,

including gifts totaling \$1,189,280 for permanent improvements and \$1,233,472 for endowments. Total assets were listed at \$69,920,000 including \$45,991,000 in real estate, improvements, and equipment and \$17,973,000 in endowment and trust funds. The libraries contained approximately 1,236,700 volumes.

During the year 1932 final improvements were completed on a 13-acre addition to the Berkeley campus for physical education and competitive sports. The cost of this project was approximately \$3,350,000 for land purchase, grading, and construction of a track stadium, baseball bleachers, and a million dollar gymnasium. More than one-third of this cost was met by students from football receipts. Construction on a \$600,000 addition to the medical school in San Francisco to house the hospital out-patient department was continued. This required the wrecking of the museum of anthropology and the removal of its contents to an unused building on the Berkeley campus. At Los Angeles two gymnasia, one for men and one for women, were completed at a cost of \$1,000,000, and an additional wing for the physics-biology building, costing \$300,000, was completed. At Riverside an entomology building was completed at a cost of \$150,000.

Among the most important gifts received in 1932 was a 750-acre ranch in southern California, with buildings and a stock of 87 pure-bred Arabian horses, from Mr. and Mrs. W. K. Kellogg. An endowment of \$600,000 for the support of breeding experiments was included. Another gift totaling \$580,000 was received from the estate of the late Mrs. Christine Breon of San Francisco for medical research; one of \$250,000 from Regent and Mrs. Sidney M. Ehrman for scholarships and a chair in European history; and one of \$100,000 from the Boys and Girls Aid Society of San Francisco for child welfare research.

Among the more important research announcements of the year was the isolation of a growth-promoting hormone and a sex hormone from the pituitary gland by Dr. Herbert M. Evans; the development of a new type of X-ray-producing apparatus, capable of furnishing emanations as powerful as any yet used more cheaply and easily; and the perfection of a new source of energy to be used for splitting the nuclei of atoms and studying the structure of all atoms in the table of chemical elements. Robert Gordon Sproul, LL.D., was president of the University of California; Monroe E. Deutsch, Ph.D., vice-president and provost; Ernest Carroll Moore, Ph.D., vice-president and provost of the University of California at Los Angeles.

**CALIFORNIA INSTITUTE OF TECHNOLOGY.** An institution for collegiate and graduate instruction and research in the pure and applied sciences in Pasadena, Calif., founded as Throop Polytechnic Institute in 1891. The enrollment in 1932 was 777, of whom 533 were in the undergraduate and 244 in the graduate school. The faculty numbered about 200. The endowment was approximately \$8,000,000 and the annual income \$750,000. There were 30,000 volumes in the library. During the year an astrophysical laboratory and the W. K. Kellogg radiation laboratory for the study of high-potential X-rays were completed, and an optical shop (part of the 200-inch telescope project) was under construction. Prof. Albert Einstein again visited the institution during 1932. The administration centres in an executive council of eight, of which

Robert A. Millikan, Ph.D., LL.D., Sc.D., is chairman.

**CALORIES.** See **FOOD AND NUTRITION.**

**CAMBODIA,** kām-bō'di-a. A French protectorate constituting one of the five component states of French Indo-China. Executive authority is exercised by the French Resident-Superior, who acts through King Sisowathmonivong (crowned July 22, 1928). Resident-Superior, F. Lavit. See **FRENCH INDO-CHINA.**

**CAMEROON,** kā'me-rōon, or **CAMEROONS.** The former German territory of Kamerun on the Gulf of Guinea, West Africa, bounded on the north by Nigeria and on the east and south by French Equatorial Africa and Spanish Guinea. Occupied by French and British troops in 1916, it was divided between the two nations in 1919 under mandates of the League of Nations.

**FRENCH CAMEROON.** France received an area of 166,489 square miles, in addition to 107,270 square miles ceded to Germany in 1911 and later incorporated in French Equatorial Africa. The population of French Cameroon in 1931 was estimated at 2,192,163, including 2163 Europeans. In 1929, there were 89 Government schools, with a total attendance of 7000, and 38 private schools, with 6748 pupils. Tobacco, almonds, palm oil, timber, rubber, cacao, and ivory are the chief products. Imports in 1930 totaled 172,852,000 francs (1 franc equals \$0.039) and exports 136,793,049 francs. The general budget for 1930 balanced at 76,290,574 francs; the special railway budget amounted to 32,073,000 francs. Highways extended 2777 miles and railroads, 292 miles. In 1930, 445 vessels entered Douala, the chief port. Yaoundé is the seat of administration. Commissioner in 1932, M. Marchand.

**BRITISH CAMEROONS.** The British portion, extending along the Nigerian frontier from the sea to Lake Chad, has an estimated area of 34,236 square miles; population (1931 census), 773,840. Chief products: bananas (dried), palm kernels, palm oil, cacao, rubber, ivory, and ebony. Imports in 1931 were valued at £107,769; exports at £155,432. Government revenue (1930-31) amounted to £81,945; expenditure, £149,952. A total of 118 vessels of 203,744 tons entered the port of Victoria, and 102 vessels of 70,329 tons entered Tiko, in 1931. British currency is in use. The capital is Buea, population about 3000. The Governor of Nigeria administers the territory. See **NIGERIA.**

**CAMP FIRE GIRLS OF AMERICA.** An organization primarily for the adolescent girl, whose purpose is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." It was organized nationally in March, 1911, and chartered in 1912, with Dr. Luther H. Gulick as president, but its foundations were laid some time before by a group who felt that the leisure time of young girls could and should be used to help them grow. A flexible programme of activities in seven fields, or crafts, and a system of awards, or honors, for accomplishment in these fields was outlined. A girl may win honors in any of the seven crafts: Home, health, hand, camp, nature lore, business, and citizenship. The purpose of these activities is not the attainment of particular skill, but the development, and happiness through development, of the individual girl who discovers new interests and new talents and at the same time enjoys the companionship of other girls. The programme also appeals to her æsthetic

sense through its ritual and symbolism, based on Indian lore and handicraft, and upon joining she chooses a symbol which signifies her ambition or ideal.

A special project is launched each year by Camp Fire Girls. Home Decoration was the theme of the 1932 project, and the girls studied the history of decoration, set up model rooms in stores, redecorated their own rooms, and asked experts in the field to teach them the principles of arrangement and color harmony so that they would be able to make their own homes more harmonious and beautiful.

The membership of the organization in 1931 was 236,032, including 173,416 Camp Fire Girls and Guardians and 36,250 Blue Birds, the youngest members. During the school year of 1930-31 and the summer of 1931, 151 training courses were given, with an attendance of 4556 leaders and college students who desired to become leaders. During the summer of 1931, 16,367 Camp Fire Girls attended 94 Class A Camps (camps having an attendance of 25 or more), while thousands of others went camping in small groups with their leaders. The organization publishes *Everygirl's*, a monthly magazine for girls, and *The Guardian*, a programme resource for leaders.

The national council, composed of delegates from local councils, is responsible for the management of the organization. The executive officers of the national board of directors, elected by the national council, have charge of special departments covering the activities of groups not under the council as well as those organized in council territory. At the meeting of the board of directors held in New York City, Oct. 7, 1932, Mrs. Lida Foote Tarr was elected president; Miss Florence Hughes, first vice president; Dr. Joseph E. Raycroft, second vice president; Dr. Jay B. Nash, third vice president; Dr. Myron T. Scudder, treasurer; Lester F. Scott, secretary and national executive. National headquarters are at 41 Union Square, New York City.

**CANADA.** The largest and most populous Dominion of the British Commonwealth of Nations. Capital, Ottawa.

**AREA AND POPULATION.** Canada comprises nine Provinces and two Territories, whose approximate land areas in 1932 and populations at the censuses of 1921 and 1931 are shown in the accompanying table. The total water area is about 180,035 square miles.

AREA AND POPULATION OF CANADA

Provinces	Land area, sq. miles	Population	
		1921	1931
Prince Edward Island	2,184	88,615	88,038
Nova Scotia	20,743	523,837	512,846
New Brunswick	27,710	387,876	408,219
Quebec	571,004	2,360,665*	2,874,255
Ontario	363,282	2,933,662	3,431,683
Manitoba	224,777	610,118	700,189
Saskatchewan	237,975	757,510	921,785
Alberta	248,800	588,454	731,605
British Columbia	349,970	524,582	694,268
Yukon Territory	205,346	4,157	4,230
Northwest Territories	1,258,217	7,988	9,723
Total	3,510,008	8,787,948*	10,376,786

\* Revised in accordance with the Labrador award of the Privy Council, Mar. 1, 1927.

\* Including 485 members of the Royal Canadian Navy counted in their homes in the census of 1931.

The population of Canada increased 45.6 per cent from 1871 to 1901 and 93.1 per cent from 1901 to 1931. Continuation of this increase "at

a relatively rapid rate" was anticipated by the Dominion Bureau of Statistics as a result of the progressive exclusion of immigrants into the United States. However, the rate of increase for the decade from June 1, 1921, to June 1, 1931, was only 18.05 per cent, as compared with 21.94 per cent and 34.17 per cent during the decades 1911 to 1921 and 1901 to 1911, respectively. The 1931 census revealed a distinct movement of population from east to west. The population of the four western Provinces increased during the decade from 2,480,664 to 3,047,792, or 22.86 per cent, while that of the five eastern Provinces rose from 6,294,655 to 7,315,041, an increase of only 16.2 per cent. The three eastern maritime Provinces had 9.72 per cent of the total population, as against 11.38 per cent in 1921 and 13.01 per cent in 1911.

Density of population in 1931 was 2.96 per square mile; in 1921, 2.50. For the 1921-31 decade, the urban population increased by 1,219,936, while the rural population gained only 366,311. Of the total 1931 population, 41.74 per cent resided in towns and cities of over 5000, compared, with 52.3 per cent of the population of the United States residing in such places. The urban population of Canada in 1931 exceeded the rural by 769,920, comprising 53.71 per cent of the total, as against 46.29 per cent rural. In 1931 there were 518 males to 482 females in the entire population, the respective totals being 5,374,541 and 5,002,245. For the decade, masculinity increased in the eastern Provinces and decreased in the western Provinces, where it was formerly greatest.

The 1931 population was divided by religious faiths as follows, according to preliminary census returns: Roman Catholic, 4,098,547 (39.48 per cent); United Church, 2,016,897; Anglicans, 1,635,269 (15.76 per cent); Presbyterians, 870,482; Baptists, 443,229; Lutherans, 394,052; Greek Catholic, 186,587; Jews, 155,606.

Populations of cities having over 50,000 inhabitants in 1931, with the 1921 figures in parentheses, were: Montreal, 818,577 (618,506); Toronto, 631,207 (521,893); Vancouver, 246,593 (163,220); Winnipeg, 218,785 (179,087); Hamilton, 155,547 (114,151); Quebec, 130,594 (95,193); Ottawa, 126,872 (107,843); Calgary, 83,761 (63,305); Edmonton, 79,197 (58,821); London, 71,148 (60,959); Windsor, 63,107 (38,591); Verdun, 60,745 (25,001); Halifax, 59,275 (58,372); Regina, 53,209 (34,432).

In 1930, exclusive of the Territories, there were 243,495 births, 109,306 deaths, and 71,657 marriages. The birth rate per 1000 of population was 23.9; death rate, 10.7. For 1929 the respective rates were 23.5 and 11.3. The birth rate in Quebec was 29.6 in 1930, compared with 21 in Ontario. For vital statistics of the Provinces, see separate article on each. For the fiscal year ended Mar. 31, 1932, immigrants into Canada numbered 25,752, compared with 88,223 in 1930-31 and 163,288 in 1929-30. Of the 1931-32 arrivals, 7088 were from the United Kingdom, 14,297 from the United States, and 4367 from other countries.

**EDUCATION.** According to preliminary census returns, the total school population on June 1, 1931, was 2,152,262, or 20.77 per cent of the total population, as against a school population of 1,710,598, or 19.49 per cent of the total, in 1921. On June 1, 1931, 92.34 per cent of the population could read and write (90 per cent in

1921). In 1930, there were 32,209 educational institutions of all kinds, with 83,144 teachers and 2,490,023 pupils. Expenditure on education for the year totaled \$165,361,198. The educational system included 30,188 ordinary day schools under Provincial control, with 2,106,878 pupils; 795 ordinary day schools, under private control, with 92,275 pupils; 342 Dominion Indian schools, with 15,743 pupils; and 152 institutions of higher learning, with an aggregate attendance of 73,515, of whom 37,400 were of university grade. Of the standard universities, six (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia) are provincially controlled; four (Dalhousie, McGill, Queens, and Western) are undenominational; and the remainder are denominational. For educational statistics of the Provinces, see article on each Province.

**AGRICULTURE.** Of the total land area of the nine Provinces (1,401,316,388 acres in 1931), approximately 358,162,190 acres are available for use in agricultural production. Preliminary 1931 census returns showed 728,664 farms in these Provinces aggregating 163,568,369 acres, as compared with 711,090 farms aggregating 140,887,903 acres at the census of 1921. All the Provinces east of Manitoba showed a decrease in the number of farms during the decade, while the western Provinces showed an increase. The number of farm owners, including managers, operating their own farms decreased during the decade from 615,180 to 586,339, or 4.69 per cent, while the number of tenants increased from 55,948 to 74,385, or 32.95 per cent, and the occupiers classed as "part owners and part tenants" increased from 39,962 to 67,940, or 70.01 per cent.

The average size of all farms in Canada in 1931 was 224.48 acres (198 acres in 1921). The value of farm property (land and buildings) was \$4,046,223,300, against \$5,071,804,309 in 1921, a decrease of 20.22 per cent. The value of land in farms declined to \$2,704,760,300 from \$3,689,170,009 in 1921, or 26.68 per cent. During the decade the average value of land per farm declined to \$3712 from \$5188 and the average value of farm land per acre fell to \$16.54 from \$26.18. This fall in the value of farm property was comparable with the fall in values of commodity prices over the same period. At the 1931 census, owners of 244,201 farms, or 33.51 per cent of the total, reported mortgages to the value of \$677,564,100, or 16.75 per cent of the value of all farms.

Canadian agriculture was severely affected by reduced crops and very low prices during the period 1929 to 1932. The estimated gross agricultural revenue declined to \$880,241,000 in 1931 from \$1,262,047,000 in 1930, \$1,631,081,000 in 1929, and \$1,806,020,000 in 1928. The estimated value of field crops, which amounted to \$1,125,003,000 in 1928, decreased to \$948,981,000 in 1929, \$662,041,000 in 1930, and \$425,065,000 in 1931. The area under field crops in 1931 was estimated at 57,964,000 acres, compared with 62,215,000 acres in 1930. The average price per bushel received by growers for their wheat was estimated at 38 cents in 1931, 49 cents in 1930, and \$1.05 in 1929. After September, 1931, however, prices of grains remained on a somewhat higher level. The estimated gross farm income in 1931 was divided as follows: Field crops, \$425,065,000; farm animals, \$95,748,000; wool, \$1,044,000; dairy products, \$237,922,000; fruits

and vegetables, \$36,234,000; poultry and eggs, \$65,178,000; fur farming, \$4,000,000; maple products, \$3,538,000; tobacco, \$7,178,000; flax fibre, \$179,000; clover and grass seed, \$1,497,000; and honey, \$2,058,000. Yields of the leading field crops in 1929, 1930, and 1931, with preliminary returns for 1932, are shown in the accompanying table.

CANADIAN CROP YIELDS, 1929-32  
[Units in thousands of bushels, except as indicated]

	1929	1930	1931	1932*
Wheat .....	804,520	420,672	304,144	431,200
Oats .....	282,838	428,148	328,278	394,876
Barley .....	103,313	135,160	67,382	82,981
Rye .....	13,160	22,018	5,322	9,937
Buckwheat .....	10,470	10,908	6,649	8,281
Mixed grains .....	35,754	44,276	39,431	39,878
Potatoes .....	39,930 <sup>b</sup>	48,241 <sup>b</sup>	52,305 <sup>b</sup>	
Hay and clover	15,833 <sup>c</sup>	16,397 <sup>c</sup>	13,960 <sup>c</sup>	

\* Estimates. <sup>b</sup> 1,000 cwt. <sup>c</sup> 1,000 tons.

Crop production in 1932 was greater than in 1931, the index of production based on nine of the principal field crops being 100.1, compared with 82.5 in 1931. The production of wheat was greater than in any other year since 1928. The preliminary estimate of the total value of field crops was \$416,586,000. With few exceptions the unit prices for 1932 crops were lower than those of 1931, but increased wheat production offset most of the decrease in value due to price declines. Allowing 130,000,000 bushels for domestic consumption, the total wheat supplies available for export and carry-over in the crop year 1932-33 amounted to 432,148,900 bushels.

The estimated acreage under pasture in 1931 was 9,428,102, compared with 9,889,513 in 1930. Livestock at the census of 1931 included 7,990,947 cattle, 4,716,761 swine, 3,608,340 sheep, and 3,129,058 horses. The number of poultry was estimated at 65,468,000.

**FISHERIES.** Besides excellent salt-water fishing areas, Canada has 220,000 square miles of fresh water containing many varieties of food fish. In 1930, \$64,026,297 was invested in the fishing industry and the number of employees was 79,558. The total value of fishery products in 1930 was \$47,804,216 (\$53,518,521 in 1929). Normally 60 per cent of the total catch is exported. Sea fish landed in 1931 aggregated 888,901,000 pounds, valued at \$14,569,000, or 113,000,000 pounds less than in 1930.

**FORESTS.** With a total forested area of 1,151,454 square miles, Canada in 1930 produced lumber valued at \$121,142,985 (\$140,989,564 in 1929, the highest figure since 1920). The total value of woods operations, including pulpwood valued at \$76,120,063, was \$219,570,129 in 1929, compared with \$212,950,799 in 1928 (pulpwood, \$74,848,077). Exports of wood, wood products, and paper, mostly to the United States, totaled \$230,604,474 in 1931 (\$289,566,675 in 1930).

**MINERAL PRODUCTION.** The Canadian mining industry was severely hit by reduced demand and price declines, the total estimated value of mineral production decreasing from \$310,850,246 in 1929 to \$279,873,578 in 1930 and \$227,456,365 in 1931, or by 28 per cent in two years. The reduction in quantity of mineral output, however, was estimated at only about 9 per cent. While the output of silver, nickel, asbestos, coal, and gypsum declined sharply, there was a large increase in gold production and the output of copper, zinc, petroleum, and some minor products

was greater in 1931 than in 1929. The values of the leading mineral products for 1931 and 1930 follow: Gold, 1931, \$55,715,120 (1930, \$43,557,003); copper, \$24,185,118 (\$37,990,226); nickel, \$15,267,453 (\$24,455,133); lead, \$7,260,060 (\$13,109,451); silver, \$6,140,739 (\$10,086,367); zinc, \$6,059,249 (\$9,635,957); platinum group (including platinum, palladium, rhodium, iridium, etc.), \$2,813,547 (\$2,437,801). Ontario led the Provinces in the value of 1931 mineral output with \$96,126,990; Quebec reported \$35,673,395; British Columbia, \$34,302,146; and Alberta, \$23,970,783.

The value of mineral production in 1932 was placed at 182,701,000 Canadian dollars, as against 228,029,000 Canadian dollars in 1931. Metals as a group were valued at (Canadian) \$103,133,000; non-metals, (Canadian) \$56,779,000. Gold production amounted to 3,055,000 fine ounces worth (Canadian) \$63,156,000, or 13.4 per cent more than in 1931; coal, 11,656,810 tons.

MANUFACTURES. Canada normally ranks second in the world production of automobiles and hydro-electric energy, third in paper and aluminum, and fifth in rubber manufacture. The gross value of manufacturing production declined to \$3,428,970,628 in 1930 from \$4,063,987,279 in the preceding year, a loss of 14.9 per cent. Lower prices accounted for part of the recession, the number of persons employed in factories dropping only 7.2 per cent from the 1929 figure. Ontario and Quebec, with gross production values of \$1,713,025,322 and \$1,022,280,687, respectively, far outranked the other Provinces in 1930. The leading industrial groups, in order of the value of their products in 1930, were: Vegetable products, wood and paper, iron and its products, animal products, textiles, non-ferrous metals, non-metallic minerals, central electric stations, chemicals and allied products, and miscellaneous industries.

The food, clothing, and certain other industries maintained a fairly high level of production during the depression years, but nearly all branches of the iron and steel industry were severely affected. Production of pig iron, which reached a record level of 1,080,000 long tons in 1929, dropped to 144,132 tons in 1932 and to 420,038 tons in 1931. The production of steel, which reached 1,378,000 long tons in 1929, was 342,788 tons in 1932 and 672,104 tons in 1931. Motor vehicles turned out of Canadian factories declined from the high record of 262,625 in 1929 to 153,372 in 1930 and 82,614 in 1931, the lowest number since 1921. Including new installations aggregating 541,325 horse power during 1931, the total hydro-electric power installation in Canada was 6,066,337 horse power. Kilowatt hours generated in 1929 amounted to 17,961,840,000 and in 1930 to 18,093,802,000. In 1931 the estimated output was 16,610,000,000 kilowatt hours, of which 1,235,325,000 kilowatt hours (7.4 per cent) were exported to the United States. The percentage of trade unionists unemployed at the end of June, 1932, was 21.9, compared with 16.3 per cent at the end of June, 1931, and 9.2 per cent on July 31, 1930.

The monthly index of the physical volume of manufacturing production, based on a monthly average for 1926 equaling 100, ranged from a low point of 66.5 for April, 1932 to a high point of 82.1 in June. Construction contracts in 1932 totaled \$132,872,400, or 57.8 per cent less than

in 1931. In 1932, the output of automobiles was 60,816 units; newsprint, 1,907,566 tons.

FOREIGN INVESTMENTS, ETC. Foreign investments in Canada, as of Jan. 1, 1930, were estimated by the Dominion Bureau of Statistics at \$6,125,959,000. Total business capital employed in Canada was \$17,500,000,000, exclusive of private capital in domestic enterprises such as farms, homes, etc. About 65 per cent was owned in Canada. The national wealth was rated at about \$30,840,000,000. Of the foreign investments in the Dominion, \$1,084,670,000 was in Dominion, provincial and municipal securities; \$1,674,865,000 in railways; \$628,230,000 in other public utilities; \$520,248,000 in the pulp, paper and lumber industry; \$546,915,000 in metal industries; \$281,000,000 in mining; \$250,000,000 in merchandise establishments; \$209,022,000 in finance and insurance; \$338,033,000 in land and mortgages; and \$492,370,000 in all other industries. Of the total foreign investments in Canada the largest share, \$3,726,745,000, was held in the United States, \$2,228,024,000 in England and \$171,188,000 in other countries. The interest on American investments amounted to about \$150,000,000 annually. Canadian investments abroad amounted to \$1,781,345,000, or nearly 30 per cent of the amount of outside investments in Canada. Of this, \$1,021,855,000 was placed in the United States, \$80,874,000 in Great Britain, and \$678,616,000 in other countries.

COMMERCE. Canadian foreign trade for the fiscal year ended Mar. 31, 1932, continued the marked decline in evidence since the high record established in 1928-29. The total for the fiscal year was \$1,166,083,261, compared with \$1,723,640,743 in 1930-31, a decrease of \$567,557,482. Imports and exports for the period 1924-25 to 1931-32 are shown in the accompanying table.

CANADIAN IMPORTS AND EXPORTS, 1924-25 TO 1931-32

Year ended March 31	Total exports	Imports for home consumption
1924-25 .....	\$1,081,861,643	\$ 796,932,537
1925-26 .....	1,328,700,137	927,328,732
1926-27 .....	1,267,573,142	1,030,892,505
1927-28 .....	1,250,598,034	1,108,956,466
1928-29 .....	1,388,896,075	1,265,679,091
1929-30 .....	1,144,938,070	1,248,273,582
1930-31 .....	817,028,048	906,612,695
1931-32 * .....	587,565,517	578,517,744

\* Preliminary.

The summary of Canadian trade for the 1931-32 fiscal year shows that Canada's imports from foreign countries dropped by \$269,398,640 (nearly 40 per cent) to \$414,127,273, while imports from the British Empire decreased only \$59,892,708 (less than 30 per cent) to \$142,981,551. Shipments to British countries comprised 38.5 per cent of Canada's total exports, against 37.1 per cent during the previous fiscal year. Exports to foreign countries decreased by \$143,855,862 (approximately 29 per cent) to \$350,103,979 and those to the British Empire dropped by \$70,692,758 (24.8 per cent) to \$219,281,004.

The United States in 1931-32 supplied imports for consumption in Canada to the value of \$327,631,000, or 60.8 per cent of the total, as compared with \$584,407,000 (64.5 per cent) in 1930-31. The United Kingdom followed with \$99,109,000 in 1931-32 (18.4 per cent of the total), as compared with \$149,497,000 (16.5 per cent) in 1930-31. Of the total Canadian exports

in 1931-32, the United States took \$219,100,000 worth (40.8 per cent of the total), as against \$349,661,000 (43.7 per cent) in 1930-31. The United Kingdom took exports to the value of \$162,139,000 (30.2 per cent), as against \$219,246,000 (27.4 per cent in 1930-31. Germany, France, and Japan were Canada's other leading customers and sources of imports. In the calendar year 1932 Canada ranked fifth among the exporting nations of the world. Exports were valued at \$628,098,000 (Canadian) of which wheat exports accounted for \$128,385,733, and imports at \$452,614,000 (preliminary figures). Comparative figures for the calendar year 1931 were: Imports, \$906,612,695; exports, \$799,653,000.

The value of imports for consumption and exports, by industrial groups, in 1930-31 and 1931-32, are shown in the accompanying table compiled from the *Canada Year Book, 1932*.

#### CANADIAN FOREIGN TRADE BY INDUSTRIAL GROUPS

IMPORTS <sup>a</sup>	1930-31 <sup>b</sup>	1931-32 <sup>b</sup> (preliminary)

<sup>a</sup> For home consumption.

<sup>b</sup> Fiscal years ending March 31.

**TOURIST EXPENDITURES.** The Dominion Bureau of Statistics estimated that for 1931 the expenditures of foreign tourists in Canada aggregated \$250,776,000 (\$279,238,000 in 1930) and that the expenditure of Canadian tourists in other countries amounted to \$76,452,000 (\$100,389,000 in 1930). The balance in Canada's favor was \$174,324,000 (\$178,849,000 in 1930). The U. S. Bureau of Foreign and Domestic Commerce estimated American tourist expenditures in Canada in 1931 at \$238,758,000 (\$266,283,000 in 1930) and Canadian tourist expenditures in the United States at \$56,902,000 (\$72,852,000).

**FINANCE.** For the fiscal year ended Mar. 31, 1932, Dominion revenues totaled \$336,737,000 (\$356,209,000 in the 1930-31 fiscal year) and total expenditures amounted to \$450,971,000 (\$440,057,000), of which \$375,403,000 repre-

sented ordinary expenditures (\$393,990,000 in 1930-31). The deficit was \$114,234,000, as against \$83,848,000 in the preceding year. The chief revenue items in 1931-32, with 1930-31 figures in parentheses, were: Customs, \$104,133,000 (\$131,209,000); excise, \$48,655,000 (\$57,747,000); Post Office, \$32,235,000 (\$30,212,000); excise taxes, \$59,606,000 (\$34,735,000); income tax, \$61,254,000 (\$71,048,000). Leading expenditure items, both ordinary and extraordinary, in 1931-32 were: Interest on public debt, \$121,151,106; pensions, \$48,686,388; Post Office, \$34,448,986; unemployment and farm relief in 1931, \$25,105,671; unemployment relief in 1930, \$13,189,843; public works, \$16,099,738; subsidies to Provinces, \$13,694,970; National Revenue office, \$13,144,210; pensions and national health, \$12,022,749; national defense, \$12,746,909; wheat bonus, \$10,907,428.

In his budget speech of Apr. 6, 1932, Finance Minister E. N. Rhodes estimated revenues for 1932-33 on the existing basis of taxation and conditions at \$319,100,000, while current expenses of the government during 1932-33 were placed at \$369,900,000, exclusive of \$9,600,000 voted for capital expenditures. To offset this anticipated deficit, the Finance Minister introduced legislation calculated to increase revenues by \$55,000,000, thus balancing current expenditures and leaving an expected surplus of \$4,300,000 (see *History*).

The gross public debt as of Mar. 31, 1932, totaled \$2,896,778,244 (\$2,672,778,954 on Mar. 31, 1931), of which \$2,565,256,579 represented the funded debt (\$2,379,599,328 in 1931). The net debt on Mar. 31, 1932, was \$2,375,846,172 and on Mar. 31, 1931, it was \$2,261,611,936.

**SHIPPING.** In the fiscal year ended Mar. 31, 1931, a total of 138,907 vessels of 92,969,104 registered tons entered Canadian ports in the sea-going, coastwise, and inland international trade, and 139,040 vessels of 92,617,979 tons cleared. Sea-going vessels entering numbered 20,737 of 28,004,762 tons and those clearing 20,800, of 26,535,387 tons. The total entrances and clearances represented an increase of 8,413,000 net tons over the preceding year, of which 1,473,000 tons increase was in sea-going and 6,940,000 tons in coastwise shipping. British vessels held first place in entrances and clearances during 1930-31, totaling 23,691 vessels of 31,715,000 net tons; the United States was second, with 13,493 vessels of 9,974,000 net tons; and Norway, Japan, Germany, Denmark, Sweden, and France followed in the order named. On July 1, 1931, the coastal and ocean-going power-driven commercial fleet of Canada, exclusive of the Great Lakes fleet, comprised 645 vessels of 959,671 gross tons. About 68 per cent of this fleet was owned or controlled by the Canadian Pacific and Canadian National railway systems. Shipments of grain to Europe from the port of Churchill on Hudson Bay, which was opened in 1931, were resumed in 1932. However, the chartering of only eight vessels for grain shipments was a disappointment. The new Welland Ship Canal, connecting Lake Erie at Port Colborne with Lake Ontario at Port Weller, was officially opened Aug. 6, 1932.

**RAILWAYS, ETC.** The single-track mileage of steam railways on Jan. 1, 1931, aggregated 42,075 miles (41,409 on Jan. 1, 1930). During 1931, according to provisional figures, the steam rail-

ways carried 26,400,000 passengers (34,698,767 in 1930) and 88,440,000 tons of freight (115,229,511 in 1930). The gross earnings were \$361,323,000 (\$454,231,650 in 1930) and the expenditures \$321,020,000 (\$380,723,411 in 1930). Net earnings of the Canadian Pacific railway lines totaled \$27,763,889, against \$38,687,673 in 1930, and working expenses were \$116,654,776, compared with \$143,874,125 in 1930. The Canadian National (Government owned) Railways reported an operating profit of about \$1,000,000 in 1931, but were \$56,000,000 short of meeting all their obligations, including interest on loans. Parliament appropriated \$112,000,000 for use of the system during the year (see *History*).

The total highway mileage at the beginning of 1930 aggregated 394,372 miles, of which 9132 were hard-surfaced, 226,583 gravel or improved earth, and 158,639 miles unimproved earth. A total of \$60,000,000 was spent on highways for construction purposes in 1931. The Canadian Air Mail Service during 1931 carried 19,000,000 letters weighing 470,461 pounds over routes totaling 6436 miles, the distance flown being 1,412,444 miles. A regular air-passenger and express service between Montreal and Quebec City was inaugurated May 19, 1932. An all-Canada telephone system was inaugurated Jan. 25, 1932, making possible conversation between Halifax, N. S., and Victoria, B. C., without the relaying of calls through the United States. In July, 1932, a direct telephone service between London and Canada was opened.

**GOVERNMENT.** Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament of two Houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members, in accordance with the distribution act of 1924, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. By the Statute of Westminster, which was approved by the British House of Commons July 10, 1931, and received the Royal Assent Dec. 11, 1931, all legal limitations upon Canada's legislative autonomy were removed. The nine Provinces have local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive.

Governor-General in 1932, the Earl of Bessborough, who assumed office Apr. 4, 1931. The composition of Parliament following the election of July 28, 1930, was: Conservatives, 138; Liberals, 87; United Farmers of Alberta, 10; Progressives, 2; Liberal-Progressives, 3; Labor, 3; Independents, 2. The Conservative Ministry sworn in Aug. 7, 1930, in order of precedence, was as follows: Prime Minister, President of the Privy Council, Secretary of State for External Affairs, Minister of Finance, Richard B. Bennett; Minister without Portfolio, Sir George H. Perley; Labor, Gideon D. Robertson; Justice and Attorney-General, Hugh Guthrie; Fisheries, E. N. Rhodes; Trade and Commerce, H. H. Stevens; Railways and Canals, Dr. R. J. Manion; National Revenue, E. B. Ryckman; Minister without Portfolio, J. A. Macdonald; Postmaster-General, Arthur Sauve; Pensions and National Health, Murray McLaren; Public Works, H. A. Stewart; Secretary of State, C. H. Cahan; National De-

fense, Lieut.-Col. D. M. Sutherland; Marine, Alfred Duranleau; Interior and Superintendent-General of Indian Affairs, Thomas G. Murphy; Solicitor-General, Maurice Dupré; Immigration and Colonization, and Mines, W. A. Gordon; Agriculture, Major Robert Weir. On Feb. 3, 1932, Minister of Immigration and Colonization and Mines Gordon assumed the portfolio of Labor also and Minister of Marine Duranleau took over the Fisheries portfolio from E. N. Rhodes, who became Minister of Finance. At the same time Arthur Meighen was made a Minister without Portfolio.

### HISTORY

**THE OTTAWA CONFERENCE.** The outstanding event in the history of Canada and of the British Commonwealth of Nations during 1932 was the imperial economic conference, held at Ottawa from July 21 to August 21. The results of the conference disappointed the more extreme advocates of inter-imperial economic coöperation. In many quarters the conference was deprecated as tending to loosen rather than strengthen the ties binding the self-governing units of the Commonwealth. Nevertheless, it resulted in substantial agreements, important more as indications of possible economic and political trends than for their immediate effect upon the Commonwealth's internal and external commerce.

Of chief importance among the agreements reached were the seven bilateral treaties negotiated by Great Britain with Canada, Australia, New Zealand, South Africa, Newfoundland, India, and Southern Rhodesia. The treaties gave the natural or raw-material products of the Dominions a preference of about 10 per cent in the British market. The United Kingdom imposed new duties on wheat and other imports, in order to give the Dominions the 10 per cent preference, and also retained existing duties for the same reason. A duty of 3 pence (6 cents) a bushel was imposed on wheat, but since the Empire as a whole produced more wheat than it consumed, the duty promised to have little or no effect on the price. British preferential tariffs were also imposed upon foreign meat, butter, cheese, fruit, eggs, condensed milk, and honey. For Canada's benefit, restrictions were removed on the entrance of Canadian live cattle, a tariff of 2 pence (4 cents) was put on copper, and Great Britain promised that the 10 per cent ad valorem tariff on foreign timber, fish, asbestos, zinc, and lead would not be reduced unless Canada agreed. By the abrogation of the British-Soviet trade agreement, Canada also received protection against competition in the British market from foreign state-controlled dumping and price fixing. In return for these concessions, the United Kingdom received from the Dominions preferences on British manufactured goods competing with local manufactures and free entry for some non-competitive goods.

The seven treaties were to run for five years. Thereafter, they could be terminated upon six months' notice from either signatory. However, the United Kingdom was authorized to either impose a preferential duty or establish a quota system on Dominion foodstuffs if an investigation at the end of three years showed the existing arrangement inimical to the interests of British producers. Further, if Dominion producers were unable to provide wheat, copper, zinc, and lead "at prices not exceeding world

prices" the mother country might cancel the preferential duties on these products at any time. The Dominions were also promised an equal status with the mother country in the trade with the non-self-governing British colonial empire.

Besides the seven British-Dominion treaties, various inter-Dominion commercial agreements were concluded. Canada signed new treaties with South Africa, Rhodesia, and the Irish Free State and commenced the revision of existing treaties with Australia and New Zealand. A South Africa-Irish Free State trade agreement was also reported to have been concluded. The tariff war between the United Kingdom and the Irish Free State prevented any agreement between them (see IRISH FREE STATE). The Free State, however, secured from Canada the same rates as did the British and in return gave Canada her lowest preferential rate.

Analyzing the Ottawa treaties, in the *New York Times* of Oct. 2, 1932, Sir Arthur Salter, British economist, said that "such diversion of trade as is caused by the agreements will be in the realm of external trade and (with small exceptions) not at the expense of the home producer. . . . The immediate consequences, whether for good or ill, will be on a very modest scale. The increased exports of English manufactured articles directly resulting from the new preferences will at most, amount to a few millions of pounds. Nor, on the other hand, will the new food duties, as they stand, cause any substantial increase of prices to either the Dominion producer or the English consumer."

As to the trend of British policy, Sir Arthur described the Ottawa treaties as "tentative but hesitating steps" toward the goal of an integrated imperial economic unit and likewise toward a closed colonial empire on the French model. Separate estimates made by the U. S. Commerce Department and the Chamber of Commerce of the United States indicated that more than \$150,000,000 of United States exports to Canada and the United Kingdom would be affected by the preferences they accorded each other under the Ottawa pacts.

The Ottawa Conference demonstrated: (1) The impracticability of a comprehensive commercial agreement embracing the whole empire; (2) the full equality of status of the Dominions in fact as well as in theory; (3) the impossibility of agreement upon the proposed empire bank and currency; (4) the unwillingness of the Dominions to modify their domestic industrial development on behalf of British manufacturers, and (5) the reluctance of the United Kingdom to abandon her economic relations with Argentina and Scandinavia or to extend substantial subsidies to the food products of the Dominions. Manufacturing interests, powerfully aided by Canada, strove to secure a ruling raising the percentage of empire content in goods entitled to receive preferences to 75 per cent. After American branch factories in Canada had threatened to close if this proposal were adopted, it was dropped. The Conference also discussed shipping conditions in the Pacific resulting from heavy subsidization of the American mercantile marine and the closing to foreigners of the shipping trade between American continental ports and Hawaii. Describing this situation as "dumping of services," the Conference appointed an imperial committee to study means of combating it.

In accordance with the Ottawa agreements,

changes in 202 out of the 807 items in the Canadian tariff, designed to increase the margin of preference to British Empire products in the Canadian market, became provisionally effective October 13. With the ratification of the agreements by the House of Commons November 3, by a vote of 128 to 80, the schedule was confirmed. In opposing ratification, the Liberals gave notice that they would not be bound by the five-year term of the treaty, if they returned to power before its expiration.

**ST. LAWRENCE WATERWAY PACT.** On July 18, 1932, a treaty was signed at Washington for the joint construction by the United States and Canada of a deep waterway opening the Great Lakes to ocean-going vessels by way of the St. Lawrence River. For details of the agreement, see UNITED STATES under *Administration*. The project was opposed by the Provinces on the lower St. Lawrence, particularly by Quebec, whose great port, Montreal, is the head of navigation on the river. On Jan. 14, 1932, the Quebec Legislature, by a vote of 54 to 7, passed a resolution opposing the project. The speech from the throne at the opening of Parliament for the winter session October 6 called upon Parliament to ratify the treaty after ratification by the United States Senate. See CANALS.

**TRADE AGREEMENT WITH NEW ZEALAND.** The open break in the commercial relations between Canada and New Zealand which took place in 1931 was healed early in 1932. Representatives of the two governments met at Honolulu, Hawaii, and on January 9 signed a new trade convention which became effective May 24, following ratification by both Parliaments. The trade agreement between France and Canada was terminated on June 16 and in consequence the French tariff on Canadian wheat and other products was substantially increased.

**COURSE OF THE DEPRESSION.** The abrupt decline in commercial and industrial activity which marked the year 1931 was checked early in 1932. Numerous factors contributed to the improvement. Grain prices maintained the relative firmness exhibited the previous fall. Exports of grain were heavy throughout the summer, Canada supplying about 78 per cent of the world demand for wheat during the 1931-32 shipping season. The trade balance became favorable in February, after 27 months during which imports exceeded exports. Credit was notably easier and there was a rise in the price of high-grade bonds. The Dominion budget deficit was held to a respectably low figure (see *Finance*). A heavy increase in gold production, together with the government's restriction of exchange operations, aided in the recovery of the exchange value of the Canadian dollar from \$0.8513 U. S. in January, 1932, to about \$0.90 U. S. in September. Industry and employment also improved early in the year, but there were numerous wage cuts and on April 1 all Federal salaries were reduced by 10 per cent. The summer months, however, brought a marked industrial decline. The paper industry was particularly hard hit, operating at 50 per cent of capacity and with newsprint bringing only \$53 a ton, as compared with \$102 in 1921. Three leading paper producers defaulted on their bonds on August 1.

The government of the Dominion played an active part in the struggle to check the depression. Over \$10,000,000 was added to the sum received by wheat growers for their 1931 crop

through the bonus of five cents a bushel paid by the government up to July 31, 1932. Effective May 10, the government increased the subvention on coal mined in the Maritime Provinces for distribution at Canadian points west of Montreal. Industry also received financial aid in the form of loans to the Beauharnois Light, Heat & Power Company (\$16,000,000) to permit the completion of its great power project by 1937, and to the Ontario Power Service Corporation (\$50,000,000). In addition to steps taken at the Ottawa Conference, the special excise tax on imports inaugurated in June, 1931, was increased to 3 per cent effective April 7. A number of loans were extended to the Provinces for unemployment relief projects and the return of unemployed persons to the land was actively encouraged.

Unemployment relief measures, however, failed to meet the demands of the situation. The summer months brought deputations of farmers and industrial workers to Ottawa petitioning for more effective steps and a Communist-led demonstration of the unemployed in Ottawa led to a clash with the police and numerous arrests. Prime Minister Bennett declined to relax the stringent penalty providing imprisonment for membership in the Communist party. The deportation of persons accused of radical tendencies, which reached 7000 during 1931, was continued despite protests from British and American liberals. Dissatisfaction on the prairies found expression in the formation in Alberta of the Coöperative Commonwealth Federation, a new Federal political party, with a collectivistic and fairly radical programme.

**THE LEGISLATIVE SESSIONS.** The spring session of the Dominion Parliament, which convened February 4 and adjourned May 26, was relatively uneventful and colorless. Legislation was passed increasing taxation in order to balance the budget (see *Finance*), extending the tenure of Federal unemployment relief to the Provinces, controlling radio broadcasting, amending the insurance act, and ratifying a trade agreement with New Zealand.

The budget measures enacted included an increase to 3 per cent, effective April 7, of the special excise tax on imports inaugurated in June, 1931, and an increase in the basic rate of the sales tax from 4 per cent to 6 per cent, effective the same date. The basic rate of income tax for corporations was increased from 10 per cent to 11 per cent, and for individuals the rates were increased by 25 per cent, with exemptions lowered and a 5 per cent surcharge on net incomes of more than \$5000. All income-tax changes applied to the 1931 income. Increases were voted also on stamp taxes, checks, money orders, travelers' checks, bills of exchange, promissory notes, sleeping-car and parlor-car tickets, cablegrams, telegrams, radiograms, long-distance telephone calls, and the net premiums of insurance companies. The budget proposals were enacted with little change and were generally approved by Canadian business.

In the Senate, a vote of censure was passed on the conduct of the three Liberal Senators—W. L. McDougald, Andrew Haydon, and Donat Raymond—in connection with the Beauharnois Light, Heat & Power Company scandal (see 1931 YEAR BOOK). Senator McDougald resigned in consequence. The closing days of the session were marked by a debate on Prime Minister Ben-

nett's request for emergency powers to deal with any situation that might arise during the recess. As in the previous year, the request was finally granted, chiefly because of the fear that the financial situation in the United States might become critical and involve Canada.

Legislation was also introduced for the establishment of a national radio-broadcasting system under government control. The right of the Dominion government to control radio broadcasting and reception had previously been confirmed when the Judicial Committee of the Privy Council on February 9 rejected appeals in behalf of provincial control from the Provinces of Quebec and Ontario. Prime Minister Bennett announced that the United States had agreed to redistribute its radio channels in order to facilitate the establishment of a Canadian national system. His programme called for the gradual establishment of a self-supporting government system, with a chain of high-powered stations across the Dominion, supplemented by smaller stations. Control was to be vested in a government board of three members.

The regular session of Parliament, which opened Oct. 6, 1932, was confronted with two outstanding tasks—ratification of the Ottawa imperial agreements and the enactment of tariff legislation necessary to put them into effect. A bill introduced in the Senate October 27 embodied the recommendations in the report of the Royal Commission on Canadian Railways, made public September 21, which received the formal endorsement of the Bennett government. The report recommended the elimination of competition between the Canadian National and Canadian Pacific systems and the joint operation of their terminals and lines. It urged the replacement of the 17 members of the Canadian National directorate by three trustees appointed for seven years. The trustees were to control the annual budget subject to ratification by Parliament and all deficits were to be met by Parliamentary appropriations rather than by issuing new securities. The government-owned Canadian National and privately-owned Canadian Pacific systems were to be maintained as separate identities and disputes regarding their joint operation were to be decided by an arbitral tribunal. The Canadian National system, partly through recurring deficits, had piled up a debt of about \$1,200,000,000 to the Dominion government and about \$1,000,000,000 to the investing public. Sir Henry Thornton, president of the Canadian National for many years, resigned on Aug. 1, 1932, after submitting recommendations parallel to those submitted by the Royal Commission.

Parliament on November 4 rejected 66 to 18 a Progressive motion to abandon the gold standard and inflate the currency. The government, however, took steps to ease money and credit by selling to the banks \$35,000,000 in two-year notes, which the banks were authorized to use as security in borrowing under the finance act. This move was accompanied by a slump in the exchange value of the Canadian dollar to \$0.8783 U. S. for the week Nov. 7–12, 1932. In view of the large blocks of Canadian securities and investments held in the United States, the 10 per cent or more premium which Canadians were forced to pay to acquire American dollars with which to pay interest and amortization charges due in the United States imposed a severe bur-

den on the government and on Canadian business men.

The new \$500,000 American legation building at Ottawa was officially opened Nov. 18, 1932. On the day previous Col. Hanford MacNider, U. S. Minister to Canada, who had asked to be relieved of his post, presented his letter of recall to the Governor-General.

For political developments in the Provinces, consult article on each Province.

**BIBLIOGRAPHY.** For authoritative discussions of the Ottawa Conference, see H. V. Hodson, "Before Ottawa," *Foreign Affairs*, July, 1932, and J. Bartlet Brebner, "Imperial Conference Results," *Current History*, October, 1932. Consult also Ralph Thompson, "The St. Lawrence Waterway Treaty," *Current History*, September, 1932; F. R. Scott, "The Permanent Bases of Canadian Foreign Policy," *Foreign Affairs*, July, 1932; Anonymous, "Neighbors: A Canadian View," *Foreign Affairs*, April, 1932; Alexander Brady, *Canada* (New York, 1932); Frederic H. Soward, "Canada and the League of Nations," *International Conciliation*, October, 1932.

**CANADA.** THE UNITED CHURCH OF. The designation applied to the single body formed by the union of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Since the formal consummation of the union on June 10, 1925, a total of 600 congregations, mostly in smaller towns and rural districts, have been amalgamated into approximately one-half that number of self-supporting charges. The board of home missions has also established 412 new fields of home-missions status, while 688 fields, which formerly received aid, have become self-supporting and have passed off the home-missions list. Foreign mission work has been carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa).

In 1931 there were in Canada, Newfoundland, and Bermuda 7622 preaching places (including home missions) in 2978 pastoral charges, 671,443 communicant members, and 1,600,083 persons under pastoral care. The fifth general council of the United Church of Canada was held in Hamilton, Ont., the latter part of September, 1932. The Rev. T. Albert Moore, D.D., secretary, was chosen moderator for 1932-34. Headquarters are at 421 Wesley Building, Toronto, Ont., Canada.

**CANADIAN PACIFIC RAILROAD.** See TUNNELS: CANADA under *History and Railways*.

**CANALS.** Canals are used not only for navigation but also to convey water for various supply purposes, such as irrigation, power development or public use, and for drainage. Indeed, with the demand for rapid, all-the-year round transport and door-to-door delivery, navigation canals have been eclipsed by railroad and motor truck developments. On the other hand, the use of canals for water supply and drainage has increased.

**INLAND WATERWAYS.** In the transportation field attention is thus centred on those works which have gone forward due to their special location and the more or less unusual conditions which have justified their construction. One of the notable events of the year 1932 in this field was the formal opening on August 6, of the Welland Canal, the great Canadian work which joins Lakes Erie and Ontario. This canal had been in service for some months before it was

dedicated and has been noted in previous YEAR BOOKS.

The proposed St. Lawrence Waterway project, a combined navigation and power development, will continue the navigable channel from Ontario to the sea. Inasmuch as this undertaking is on the international boundary between Canada and the United States, it has been the subject of a special St. Lawrence Waterway Treaty. The treaty alone, however, does not solve this problem. Before construction can begin a market for the power to be developed must be found, domestic differences in both countries must be settled, and the large funds necessary for construction must be provided. The situation is further complicated by differences between the Federal Government and the State of New York and between the advocates of this waterway and those who insist that the New York State Barge Canal should be developed for this purpose. *The Engineering News-Record* remarks editorially that, while the treaty, "a piece of political strategy," has been signed, "the canal is less likely to be constructed as a comprehensive undertaking than as the accompaniment of power developments," undertaken piecemeal as the demand for power justifies their construction. A step in this direction is seen in the transfer of the canal being constructed by the Beauharnois Corporation between lakes St. Francis and St. Louis to the Canadian Dominion Government. Power rights will be retained by the company but it is expected that the canal will be equipped as a branch navigation feeder for the St. Lawrence project.

Work on the 9-ft. channel between St. Paul and St. Louis on the upper Mississippi will involve 25 dams with locks and appurtenances. Construction has been going forward on Dam 15, located between Davenport, Iowa, and Rock Island, Ill., one of the most important lock and dam projects on this Inland Waterway.

Meanwhile the Illinois Waterway, a 60-mile link to connect the Chicago Drainage Canal, and thus Lake Michigan, with the Mississippi, has been rapidly nearing completion. These works, together with the recently completed Ohio River canalization (see YEAR BOOK, 1931), greatly extend navigation in the upper Mississippi and its tributaries. It would appear that the future of inland waterway transportation in the United States will depend in large measure on the successful use of these Federal facilities.

In New York State, however, the Barge Canal enthusiasts have received another blow in that the tonnage on the Lake Champlain Canal has declined almost 50 per cent since 1928. State Superintendent of Public Works Greene has advised that the Glen Falls and Ft. Edward feeder canal be abandoned.

Coastal waterway construction has been continued during the year by the U. S. Corps of Engineers, particularly in Florida and in the line to join the mouth of the Mississippi with that of the Rio Grande. Although of doubtful economic value, comparatively small appropriations have, from time to time, been made which permit these constructions to be carried forward.

Abroad there is to be noted the interesting navigation and power canal under construction on the upper Rhine. Ultimately this will form a link of a system which will connect Basle, Switzerland, with Strassburg in Alsace, and will be known as the Grand Canal d'Alsace.

**PANAMA CANAL.** Construction of the Madden Dam and reservoir, to furnish additional water for lock operation and for flood control on the Chagres River, has been going forward. (See DAMS; PANAMA CANAL.)

**ALL-AMERICAN CANAL.** On Feb. 11, 1932, voters of the Imperial Irrigation District of Southern California, approved, by a vote of 5 to 1, a repayment contract with the U. S. Bureau of Reclamation covering the construction costs of this canal, to bring water from the Colorado River to the Imperial Valley. The Boulder Canyon Dam project included this construction as one of the units to be built, provided a suitable guarantee for the return of construction costs could be secured. While no appropriation has as yet been made by Congress the project will undoubtedly go forward as soon as funds are provided.

From a diversion dam and desilting works on the Colorado about 15 miles northeast of Yuma, Ariz., the canal turns southwest and parallels the United States-Mexican boundary westward through Calexico to the West Main Imperial Valley Canal. The canal section starts with a capacity of 15,000 cu. ft. of water per second (sec. ft.), 5000 ft. are diverted for the Yuma Irrigation project and for power development at Pilot Knob, while the Coachella Branch canal, 130 miles long, to be built on the east side of the Imperial Valley, will divert 2000 sec. ft. The main canal section is 200 ft. wide at the waterline, 134 ft. at bottom, and 22 ft. deep. Over 60 million cubic yards of excavation are required and the cost is estimated at \$34,000,000. The size and scope of this project, a truly remarkable canal undertaking, is indicated by this figure. Details were published in the *Western Construction News* (San Francisco) Mar. 10, 1932, pp. 127-134.

**CANARY ISLANDS.** A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2810 square miles; population, estimated at 566,735 on Jan. 1, 1931. Santa Cruz de Tenerife, with an estimated population of 60,099 (Jan. 1, 1931), and Las Palmas, population 76,178, are capitals of the two provinces into which the islands were divided in 1927. Fruits and vegetables are grown for export. There is regular steamship, cable, and wireless communication with continental Spain, of which the islands are administratively a part. See SPAIN.

**CANCER.** See CHEMISTRY, INDUSTRIAL; MEDICINE AND SURGERY.

**CANINE DISTEMPER.** See VETERINARY MEDICINE.

**CAPE COLONY.** See CAPE OF GOOD HOPE PROVINCE.

**CAPE OF GOOD HOPE PROVINCE.** The southernmost of the four original Provinces of the Union of South Africa; formerly known as Cape Colony or the Colony of the Cape of Good Hope. Area, 276,536 square miles; total estimated mean population on June 30, 1932 was 3,163,700 including 758,000 Europeans. The number of Europeans at the census of 1931 was 749,231. The chief towns, with their white populations in 1931, were: Cape Town (the capital), 150,914; Port Elizabeth, 43,924; East London, 27,801; Kimberley, 18,618. In 1930, births were 19,468 (European), 40,609 (non-European); deaths 7416 (European), 26,142 (non-Europeans); marriages 6529 (European), 9752 (non-European).

Education is compulsory for white children. In

1930, there were 2345 public and 34 aided private schools for white children, with 143,997 pupils, and 2325 public and aided private schools for colored children, with 211,197 pupils. The total ordinary provincial expenditure in 1930-31 was £4,678,300, and the total revenue was £4,468,685, including £2,147,722 received as a subsidy from the Union government. Administrator in 1932, J. H. Conradie, appointed 1929. See SOUTH AFRICA, UNION OF.

**CAPE VERDE (vũrd) ISLANDS.** A group of 14 islands about 320 miles off the western coast of Africa belonging to Portugal. Area, 1517 square miles; population in 1929, 153,738, including 54,559 Negroes, 94,977 mulattoes, and 4202 whites. Sisal, castor oil, coffee, mustard, brandy, oranges, and hides are the chief products. Imports in 1930 were valued at 67,215,760 escudos and exports at 4,495,543 escudos (1 escudo exchanged at about \$0.424 in 1931). The budget for 1931-32 estimated revenue at 20,106,086 escudos and expenditure at 20,099,808 escudos. A total of 1593 ships of 4,197,000 tons entered the ports in 1929. St. Vincent, the chief port, is a transatlantic coaling station. A Governor administers the islands from Praya (Praya), the capital. Governor in 1932, Col. Antonio A. Guedes Vaz. See PORTUGAL.

**CARBAJAL,** FRANCISCO C. M. Mexican president, died in Mexico City, Sept. 30, 1932. He was born in Mexico in 1860, and studied law. He practiced law, and in 1914 when President Victoriano Huerta faced the revolutionary forces he took the presidential chair for the Provisional Government and served for only a few months. He then signed the Treaty of Teoloyucan, giving unconditional federal and military power to General Obregon. He returned to the practice of law and later was appointed Justice of the Supreme Court where he served several years and then again returned to private practice.

**CARDINALS.** See ROMAN CATHOLIC CHURCH. **CARINTHIA,** ka-rin'thi-a. A Province of the Republic of Austria; formerly a crownland of the Austro-Hungarian Empire. Area, 3680 square miles; population at the census of 1923, 370,817. Capital, Klagenfurt (pop. 27,423 in 1923). See AUSTRIA.

**CARLETON COLLEGE.** A coeducational institution of higher learning in Northfield, Minn., founded in 1866 and maintaining relations of cooperation with the Congregational, Baptist, and Protestant Episcopal churches. The enrollment of the autumn of 1932 was 845. There were 63 faculty members. The endowment amounted to \$2,839,552.75, and the total income of the year was \$529,983.84. There were 102,000 volumes and 31,000 pamphlets in the library. President, Donald John Cowling, Ph.D., D.D., LL.D.

**CARLSEN,** EMIL. An American landscape and marine painter, died in New York City, Jan. 2, 1932. He was born in Copenhagen, Denmark, Oct. 19, 1853, where he studied architecture at the Royal Academy. Coming to the United States in 1872, he was first known as a still-life painter, somewhat in the manner of Chattran, whose cool tints strongly appealed to him. As a landscape and marine painter, he excelled in line and arrangement and in sincerity of presentation. His marines were particularly good in the movement of the water, although their luminous Delft-blue color was not always convincing. He received a gold medal at the Louisiana Purchase Exposition in St. Louis in 1904, a bronze medal

at the International Exposition in Buenos Aires in 1910, a medal of honor at the Panama-Pacific Exposition in San Francisco in 1915, and a gold medal at the Sesqui-Centennial Exposition in Philadelphia in 1926. Other honors include the Webb prize (1905) of the Society of American Artists; the Inness medal (1907), Saltus gold medal (1916), and Carnegie prize (1919) of the National Academy of Design; and the Temple gold medal (1912), Lippincott prize (1913), and Jennie Sesnan gold medal (1916) of the Pennsylvania Academy of Fine Arts.

Among Carlsen's best known works are: "Still Life" and "Open Sea" in the Metropolitan Museum of Art, New York City; "Moonlight on the Kattegat," Albright Art Gallery, Buffalo; "The South Strand," National Gallery, Washington; "Moonlight on a Calm Sea," Corcoran Gallery of Art, Washington; "The Lazy Sea," Brooklyn Institute Museum; "Still Life" and "The Miraculous Draught," Art Institute of Chicago; "Open Sea" and "Woods Interior," Minneapolis Institute; "Coast of Maine," "Entrance to St. Thomas's Harbour," and two still life pictures, City Art Museum, St. Louis; "Summer Clouds," Pennsylvania Academy of the Fine Arts, Philadelphia; and "Morning," Rhode Island School of Design, Providence. He was an influential member of the Society of American Artists until its consolidation in 1906 with the National Academy of Design. He was elected an associate of the latter in 1904 and an academician in 1906. Also he was a member of the National Institute of Arts and Letters.

**CARNEGIE CORPORATION OF NEW YORK.** Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable elsewhere than in the United States. The corporation has conceived its function to be not that of an operating agency in itself, but rather that of an agency charged with the duty of studying and estimating those forces and institutions that make for the advancement and diffusion of knowledge and understanding in the areas specified, and of aiding these institutions in such measure as may be possible, having care always to the fact that the income of this endowment is to be a liquid asset for each generation.

In 1932, as in the previous year, approximately two-thirds of the annual income of the corporation was devoted to a reduction of unpaid obligations, which on September 30 amounted to \$18,501,864. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1931-32 the sum of \$5,256,107 was appropriated. Of this amount \$873,100 was applied toward library service; \$368,500 toward the encouragement of adult education activities; \$604,750 toward the support of national organizations in the field of fine arts and of departments of art in colleges and universities and of projects for developing appreciation of the arts; \$770,675 toward the support of educational and scientific studies and research publications; and \$2,579,082 toward general interests, including the Carnegie Endowment for International Peace.

The corporation made scholarship grants for graduate study by qualified students of library science. It continued to support various impor-

tant projects, such as research in the study of cosmic rays, leukemia, solar radiation, velocity of light and vitamins, and study of susceptibility to infectious diseases. Various studies conducted by the American Historical Association and the American Law Institute were continued during the year. From the income of its \$10,000,000 fund, the corporation continued its five-year programme in British Africa, involving a total of \$500,000. This included scientific research, aid to Jeanes Schools, exchange of educational visits, and library service, carried on largely through responsible local bodies. Various educational enterprises in Canada, Australia, and New Zealand were also aided.

The trustees of the corporation in 1932 were: Newton D. Baker, James Bertram, Nicholas Murray Butler, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, David F. Houston, Henry James, Frederick P. Keppel, Russell Leffingwell, John C. Merriam, John A. Poynton, and Elihu Root. Officers of administration were: Elihu Root, chairman of the board; Robert A. Franks, vice chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary; and Robert M. Lester, assistant to the president. Headquarters are at 522 Fifth Avenue, New York City.

**CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING,** THE. A foundation established on Apr. 16, 1905, by Andrew Carnegie who placed an endowment of \$10,000,000 in trust with 25 trustees, mostly presidents of universities and colleges, for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. The foundation provides retiring allowances for teachers in universities and colleges and pensions for their widows, and studies various phases of the educational process. It was incorporated by Act of Congress in 1906. Its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908, and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York, which Mr. Carnegie established in 1911. On June 20, 1932, the foundation had endowments and accumulated reserves amounting to \$31,529,589, and had distributed \$23,652,795 in retiring allowances and pensions to 1313 teachers and 641 widows, chiefly through 95 associated institutions, selected for their educational standing.

The foundation publishes extensive annual reports, which deal with many educational problems. Its division of educational inquiry, established in 1913, has issued 26 comprehensive bulletins, dealing with medical, legal, engineering, dental, and vocational education, the training of teachers, intercollegiate athletics, and kindred subjects. In 1932, the foundation having completed a study of State higher education in California, upon legislative and executive invitation, was engaged upon studies concerning State higher education in the United States, and the relations between secondary and higher education in Pennsylvania. Dr. Henry Suzzallo is president, Dr. Henry Smith Pritchett, president emeritus; Howard J. Savage is secretary. The headquarters are at 522 Fifth Avenue, New York City.

**CARNEGIE INSTITUTE OF PITTSBURGH.** See ART EXHIBITIONS; ART MUSEUMS. **CARNEGIE INSTITUTE OF TECHNOLOGY.** A nonsectarian institution for technical education at Schenley Park, Pittsburgh,

Pa., founded in 1900. The enrollment for the autumn of 1932 was 4084, including 2355 registered in the regular day courses and 1729 in the evening courses. For the summer session 792 students were enrolled. The faculty numbered 415, of whom 295 were on full time and 120 on part time. The endowment of the institution was \$16,383,000 and the annual income \$840,000 (not including student fees). The institute is adjacent to the Carnegie Library of Pittsburgh, which has 450,600 volumes. President, Thomas Stockham Baker, Ph.D., LL.D., Sc.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery and the application of knowledge to the improvement of mankind." The institution attempts to advance fundamental research in fields not normally covered by the activities of other agencies, and to concentrate its attention upon specific problems with the idea of shifting attack from time to time to meet the more pressing needs of research. Its major activities in 1932 were carried on through the following departments and divisions: Department of embryology (located in the Hunterian building of the Johns Hopkins University medical school); department of genetics (laboratory at Cold Spring Harbor, Long Island, N. Y.); geophysical laboratory; division of historical research, including the sections of aboriginal American history, United States history, and history of science; department of meridian astrometry (headquarters at the Dudley Observatory, Albany, N. Y.); Mount Wilson Observatory, in Pasadena, Calif.; nutrition laboratory, in Boston; division of plant biology (central laboratory at Stanford University); department of terrestrial magnetism; Tortugas (Fla.) Laboratory of Marine Biology.

During 1932 closer relations have been established between various research groups of the institution. Problems relating to human growth and development occupied the attention of biological groups. Studies have progressed concerning embryonic forms of life, as well as later types which have taken on individuality. Such studies pertain to growth of individual cells and body tissue, behavior of chromosomes, nutrition and metabolism, and influences of hormones formed by glands of internal secretion. In one case a new substance has been discovered which is required in the process of milk secretion.

In studies of the physics of matter other groups of the institution are using the universe as a laboratory. Such investigations concern the physics and chemistry of the sun and stars, conditions of interstellar space, condition of the earth's interior, physical phenomena at various localities on the earth's surface and in the atmosphere, penetrating radiation or influence of the cosmic ray, and fundamental questions of atomic physics.

Public lectures and exhibits relating to the work of the institution proceeded as usual, with increasing emphasis upon determination of the most effective means for interpretation and dissemination of information concerning results of such work. Special study was also being given to the problem of applying these results to educational and humane use, making them known initially through technical and scientific journals, the institution's *Year Book*, and a series of scientific monographs. During 1932 the executive

committee authorized publication of 20 new volumes; a total of 16 volumes was issued.

Total receipts of the institution, representing interest on investments and bank balances, and sales of publications, amounted to \$1,712,450 for the year. The president in 1932 was John C. Merriam. The officers of the board of trustees were: Elihu Root, chairman; Henry S. Pritchett, vice chairman; Frederic A. Delano, secretary. The executive committee included: Henry S. Pritchett, chairman; Frederic A. Delano, Cass Gilbert, John C. Merriam, William Church Osborn, Stewart Paton, and Elihu Root. Headquarters are at Sixteenth and P Streets, N. W., Washington, D. C.

**CAROLINE ISLANDS.** A group of about 549 coral islets in the western Pacific, having an area of about 830 square miles, transferred from Germany to Japan under mandate of the League of Nations by the Versailles Peace Treaty. The chief islands, with 1931 populations, are: Ponapé, with 8586 inhabitants; Yap, an important wireless and cable station, with 6818; and Parao, with 8010. Sugar, copra, and phosphates are the chief exports.

**CARRUTHERS, SIR JOSEPH HECTOR MCNEIL.** An Australian statesman, died in Sydney, N.S.W., Dec. 10, 1932. He was born Dec. 21, 1857, and received his education at Sydney University and St. Andrews University, Scotland. In 1878 he was appointed a solicitor. Elected to the Legislative Assembly of New South Wales in 1887, he served continuously as a member of that body until 1908. He was also a member of the Federal Convention that, meeting at Sydney in March, 1891, declared itself in favor of an Australian union and laid down the principles upon which the new commonwealth should be based. During 1888-91 he was Minister for Public Instruction; during 1894-99, Minister for Lands; and in 1899, Colonial Treasurer. In 1902 he became leader of the Liberal Opposition in the Assembly and two years later was appointed Premier and State Treasurer, serving until 1907. He founded the Liberal and Reform Association. In 1909 he was appointed a life member of the Legislative Council of New South Wales, and during 1922-25 was vice-president of the Executive Council of the New South Wales government. At the time of his death he was president of the New South Wales Chamber of Agriculture. In 1908 he was created a Knight Commander of St. Michael and St. George. He was the author of *Captain Cook, 150 Years After* (1930).

**CARS, MOTOR.** See AUTOMOBILES.

**CARTELS.** See CHILE; CUBA.

**CARTY, JOHN JOSEPH.** An American electrical engineer, died in Baltimore, Md., Dec. 27, 1932. He was born in Cambridge, Mass., Apr. 14, 1861, and attended the Cambridge Latin School. In 1879, three years after the invention of the telephone by Alexander Graham Bell, he began his work in telephony with the Bell Telephone Co. in Boston. There he designed and installed the first metallic circuit multiple switchboard, whose special feature was a common battery at the central office to supply current for signaling. The use of such a centralized battery proved later an important step forward in the development of the telephone exchange, as it not only did away with the magneto call at the subscriber's instrument or the necessity for local batteries at the individual substations but assured through its automatic action reliability of signaling. Akin

to this principle was the operation of two or more telephone transmitters from the same circuit by using secondary or storage batteries of very low internal resistance.

In 1887 Carty assumed charge of the cable department of the Western Electric Co. in New York City, a subsidiary of the Bell system, supervising all the important cable-laying projects in the eastern cities and directing the switchboard organization. Two years later he became chief engineer of the Metropolitan Telephone & Telegraph Co. (later the New York Telephone Co.). He invented at this time a method of neutralizing the influence of electrostatic induction, which produced "cross-talking" or overhearing, by the use of condensers and twisting the wires together according to a certain plan. He developed the "phantom line" or "bridging" method of connecting telephone instruments so that two complete metallic circuits might be made to serve three subscribers instead of two, a principle which made possible a larger number of toll or party line stations on a single circuit and the development of the rural telephone service.

In 1907 Carty was appointed chief engineer of the American Telephone & Telegraph Co., the parent organization of telephone companies throughout the United States. The staff under his direction in the Bell Telephone Laboratories was responsible for the solution of many of the problems connected with long distance telephony. In 1913 there was laid under his direction an underground cable between Boston and Washington, equipped with loading coils. Experiments with trans-continental telephony continued until by 1911 Denver was successfully connected with the eastern seaboard and by 1913 Salt Lake City. On Jan. 25, 1915, the New York-San Francisco telephone line was opened. Trans-oceanic communication continued apace, the first successful contact having been established in October, 1915, by means of radio-telephone equipment designed and operated under his direction from the U. S. naval station at Arlington, Va., to the Eiffel Tower in Paris. Other experiments were carried out between Washington and Hawaii and the Canal Zone.

On the entry of the United States into the World War Carty organized among the telephone personnel 12 battalions of picked signal corps troops. Later, having been made a colonel, he was sent to France to organize a research and inspection division for the chief signal officer and was responsible for the maintenance of communications between General Pershing at the A.E.F. headquarters and the War Department in Washington. After the Armistice he had charge of communications for the American Commission to Negotiate Peace. In 1921 he was promoted to the rank of brigadier general in the Reserve Officers' Corps. In recognition of his war service he was made an officer of the French Legion of Honor and received the Distinguished Service Medal of the United States.

In 1919 Carty was made vice-president of the American Telephone & Telegraph Co., which office he held until his retirement in 1930. In 1923 he was elected chairman of the board of directors of the Bell Telephone Laboratories. He was a trustee of the Carnegie Institution of Washington and the Carnegie Corporation of New York and was a Fellow of the American Academy of Arts and Sciences. During 1915-16 he was president of the American Institute of Electrical En-

gineers. He received the Longstreth Medal (1903) and the Franklin Medal (1916) from the Franklin Institute, the Edison Medal (1918) from the American Institute of Electrical Engineers, and the John Fritz Medal (1928), awarded jointly by the four national engineering societies. The Japanese government, in recognition of the services which he rendered toward the development of the telephone system in Japan, conferred on him the orders of the Rising Sun and the Sacred Treasure. He wrote extensively for the National Research Council, the Smithsonian Institution, and other scientific bodies.

#### CASE SCHOOL OF APPLIED SCIENCE.

An engineering college in Cleveland, Ohio, founded in 1881. In the autumn of 1932 the enrollment was 687 students. The summer session registration was 154. The faculty numbered 79. The endowment amounted to \$4,500,000. The library contained 25,000 volumes. President, William Elgin Wickenden, D.Eng., D.Sc.

#### CASUALTY INSURANCE. See INSURANCE.

**CATALONIA (CATALUÑA).** A formerly independent principality occupying the north-east corner of Spain, which was deprived of its liberties and parliament in 1714 by Philip V of Spain and divided in 1833 into the four Provinces of Barcelona, Gerona, Lérida, and Tarragona. The area is 12,427 square miles; the population was estimated at 2,490,889 on Jan. 1, 1931. Barcelona, the principal city had 782,842 inhabitants on the same date. It is the centre of a thriving industrial, commercial, and agricultural region. For political developments in 1932, see SPAIN under *History*.

**CATHOLIC CHURCH.** See ROMAN CATHOLIC CHURCH.

**CATHOLIC UNIVERSITY OF AMERICA, THE.** A national institution of higher education in Washington, D. C., founded in 1887 by the Roman Catholic hierarchy with the approval of the Holy See, from which it derives its constitution, and chartered by an Act of Congress. The enrollment for the autumn term of 1932 was 1387, distributed in the following schools: graduate school of sacred sciences, 10; seminary, 145; canon law, 24; law (coeducational), 50; engineering, 149; arts and sciences, 436; and graduate school of arts and sciences (coeducational), 615. The enrollment for the summer session of 1932 was 1031. Affiliated with the university is the Catholic Sisters' College (200 students); Trinity College for Women (365 students); National Catholic School of Social Service (60 students); and 33 religious houses of study in the immediate vicinity with an enrollment of about 800 students. In addition, there are affiliated throughout the United States 5 seminaries, 32 colleges, 225 high schools and academies, and 57 novitiates.

The university is governed by a board of trustees (prelates, priests, and laymen) through the rector, who is advised by an academic senate composed of representatives (lay and clerical) of the various faculties. The faculty of the university proper numbered 145, of whom 34 were full professors. The endowment amounted to approximately \$3,000,000, plus an annual collection of about \$410,000. The library contained 350,000 volumes. Administrative officers: the Rt. Rev. James H. Ryan, Ph.D., S.T.D., LL.D., Litt.D., rector; the Rt. Rev. Edward A. Pace, Ph.D., S.T.D., LL.D., vice rector; the Rt. Rev. David T. O'Dwy-

er, procurator; and Prof. Richard J. Purcell, Ph.D., general secretary.

**CAVALRY.** See MILITARY PROGRESS.

**CELEBES.** See NETHERLAND INDIA.

**CELEBRATIONS.** Staid and conservative Americans and Englishmen are beginning to overcome their hesitations in appearing publicly in costumes of bygone years, and the celebration of historical events is each year becoming more colorful, especially those that by their nature can be fittingly observed in the open. The year 1932 saw many open-air celebrations. Perhaps because of the general unemployment, there was more time available for preparation; or possibly there was, in general, a greater sympathy, a deeper feeling for the hardships in earlier days that, experienced vicariously, helped to stiffen the morale of the celebrants. Through either cause, such celebrations more nearly resembled well-rehearsed pageants than the self-conscious motley-garbed groups of former years assembled for speech-making and orations.

All of the celebrations of the year could not be listed here; but the more important ones of Europe and America in chronological sequence follow:

*January 27.* The centenary of the birth of Lewis Carroll (the Rev. C. L. Dodgson) was commemorated at Liverpool by special services. At Guildford, wreaths were placed on his grave. On May 1, Mrs. R. L. Hargreaves, the original "Alice" of the Lewis Carroll books, became the guest of Columbia University, New York, to add her presence to the closing days of an extensive Lewis Carroll exhibition. A special composition by Edgar Stillman Kelley, the "Alice in Wonderland" suite, was interpreted by a large chorus from the Barnard College and the Hunter College Glee Clubs. In early July further ceremonies were observed in London by a display of memorabilia—drawings, letters, portraits, etc. The occasion was made notable through the presence of Mrs. Hargreaves, and of Mr. Peter Davies, the original Peter Pan.

*February 8.* The 100th anniversary of the death of the poet, George Crabbe, was commemorated at Trowbridge, Eng., where the poet had spent the last 18 years of his life as rector of the parish. The Dean of St. Paul's, Dr. W. R. Inge, and the Poet Laureate, John Masefield, joined in their tributes.

*February 22.* The bicentennial of the birth of George Washington was the occasion for extensive celebrations in all parts of the United States and for commemorations throughout the world. In France, Germany, England, Italy, and other European countries; in Japan, in Chile, Argentina, and other South American countries, special commemorative services were held. Poland issued bicentennial stamps and renamed the widest avenue in Warsaw; in Italy, an avenue in Rome was named; in France, a bronze medal was struck.

At Mt. Vernon, Md., President Hoover made a speech and opened the official commemoration of the bicentennial which was observed throughout the nation until Thanksgiving Day.

In Bryant Park, New York, a reproduction of Federal Hall was erected where, on April 30, the scene of Washington's inauguration as first president of the United States was reenacted. In Prospect Park, Brooklyn, a reproduction of Mt. Vernon was constructed and furnished, many of the furnishings being actual possessions of Washington; a duplicate structure had previously been erected at Paris, France. Although the day itself was fittingly observed by special, and, sometimes elaborate ceremonies by cities and various local organizations, the general idea prevailed that it was a bicentennial year, rather than a day, and many ceremonies were postponed to more clement weather (see WASHINGTON BICENTENNIAL).

*March 22.* The centenary of the death of Johann Wolfgang von Goethe was observed in all countries in which the works of the German poet were appreciated. At Weimar, his home city, honors were heaped on his memory in ceremonies in which the German chancellor, Dr. Brüning, participated. In the United States, the poet's memory was honored by scores of literary and musical organizations. (See also FRENCH LITERATURE, GERMAN LITERATURE, ITALIAN LITERATURE.)

*March 31.* The bicentenary of the birth of Franz Josef Haydn was officially celebrated in Vienna, by services in which Herr Miklas, president of the Austrian Republic, participated. Other commemorative concerts, featuring the work of the composer, were held in London and New York.

*April 21.* The anniversary of the traditional date of the founding of Rome, 2685 years previously, was celebrated throughout Italy. Notable among the improvements officially opened was the forum of Cæsar, recently brought to light. According to custom, young Fascisti were officially admitted into the Fascist party; more than 100,000 receiving such memberships this year.

*April 22.* The centenary of the birth of Julius Sterling Morton, originator of "Arbor Day," was celebrated at Arbor Lodge, his former home, at Nebraska City, Neb. Special commemorative stamps were issued by the Post Office Department.

*April 23.* On the anniversary of the birthday of William Shakespeare, the Prince of Wales officially opened the new Shakespeare Memorial Theatre at Stratford-on-Avon. Before the opening performance of "Henry IV," which was attended by the American Ambassador, Mr. Mellon, and by the ministers and representatives of many lands, John Masefield, poet laureate, delivered an ode. The town had previously staged a pageant, costumed in the garb of Shakespeare's day.

*April 30.* As a feature of the Washington Bicentennial, the inauguration of the first president was reenacted at New York City. The impersonator of Washington, Kenneth W. Murchison, on an oared barge from the New Jersey shore, landed at the foot of Wall Street, and in a replica of the coach used in 1789 was driven to Fraunces Tavern where the historic farwell of Washington to his officers in 1783 was reenacted. Descendants of the officers participated in the ceremony. At the replica of Federal Hall in Bryant Park, the inauguration procession of 143

years ago was reproduced in costume by the 107th Infantry, and was followed by the reenactment of the inaugural ceremony in which Chancellor Livingston, who first administered the inaugural oath, was impersonated by a descendant, James Duane Livingston. In the evening, from the George Washington Memorial Bridge, opened in 1931, impressive fireworks were displayed.

*June 2.* The fiftieth anniversary of the death of Giuseppe Garibaldi, the Italian liberator, was celebrated throughout Italy. In Rome the chief ceremony was the reburial of his wife, Anita, on the top of Janiculum Hill.

*June 9.* The 1500th anniversary of the landing of St. Patrick in Ireland was celebrated on the traditional date for the first time by Protestant churches in Belfast. In addition to a historic pageant at Strangford and at Belfast Castle, services were held in the Armagh Cathedral. The principal feature in the Roman Catholic celebration was the erection of a statue at Saul to mark the spot where St. Patrick landed.

*July 16-22.* In connection with the Washington Bicentennial, the trip taken by George Washington and Gov. George Clinton in 1783 through the Mohawk Valley was reenacted in a week of celebration which started at Schenectady and ended at Utica. The original trip ultimately resulted in the construction of the Erie Canal.

*July 17.* As a part of the ceremonies attending the celebration of the 1000th anniversary of the Icelandic Parliament, a statue of Leif Ericson, "the first white man to come to America," and the gift of the American people to Iceland, was unveiled at Reykjavik. The statue is the work of the American sculptor, A. Stirling Calder, and presents the early Icelandic adventurer standing on the foredeck of his Viking ship. (For illustration, see article SCULPTURE in 1931 YEAR BOOK.)

*July 25.* To celebrate the 157th anniversary of the U. S. Postal Service, Major James Doolittle (see also AERONAUTICS, *Speed Records*), with Miss Anne Madison Washington, a great-great-grandniece of George Washington, and an official observer, made a flight of 2610 miles in one day, starting from Boston at 4.25 a.m. and ending at Newark at 9.05 p.m., covering all points reached by George Washington in his travels, and dropping thirty packages of mail at points of historic interest. It was estimated that at the founding of the postal service, the same trip would have required four years by coach.

*July 30-August 14.* The tenth Olympiad was held at Los Angeles, Calif., celebrating the ancient Olympic Games. Two thousand athletes,

representing 39 countries, participated. See OLYMPIC GAMES.

*August 21.* At the highest point of Cape York, Greenland, 600 miles north of the Arctic Circle, a memorial shaft, 60 ft. in height, after a month of rigorous weather during its erection, was dedicated to Rear-Admiral Robert E. Peary, the first Arctic explorer to reach the North Pole, Apr. 6, 1909. The cornerstone was laid by Capt. Robert A. Bartlett, Peary's close friend and Arctic companion, and the monument was dedicated by the explorer's daughter, Marie Ahnighito Peary Stafford.

*September 21.* The centenary of the death of Sir Walter Scott was commemorated throughout Scotland, and especially by services in Edinburgh. At Galashiels, the home town of the poet, a memorial was unveiled.

*October 16-30.* The tenth anniversary of Fascism opened at Turin, Italy, by celebrations at which Premier Mussolini was the chief speaker. Successive celebrations were held at other cities through which the "march on Rome" had passed, and final celebrations were held in Rome by parades and the Fascist Decennial Exposition.

*October 20.* The tercentenary of the birth of Sir Christopher Wren was commemorated in St. Paul's Cathedral, London, the product of his architectural genius. At William and Mary College, Williamsburg, Va., the Wren Building, previously destroyed by fire, was rededicated.

*November 12.* The 600th anniversary of the construction of the parish church at Twickenham, Eng., was celebrated.

Throughout the year various buildings and structures which will be features of the "Century of Progress" Exposition, were completed at Chicago. This World's Fair, it is planned, will open on June 1, 1933, and is intended to present the story of man's achievements in the past hundred years. Exhibits by all leading nations of the world have been arranged. The sixteen buildings completed during the year include the buildings devoted to Administration, Travel and Transport, Science, Radio, Communication, Electricity, Agriculture; the Lincoln group, a replica of the Golden Temple of Jehol, a replica of Fort Dearborn, the Federal Building, and the Hall of States. See CHICAGO. A CENTURY OF PROGRESS.

**CEMENT.** The preliminary estimates of production for the Portland cement industry in the

ESTIMATES OF PRODUCTION AND SHIPMENT OF FINISHED PORTLAND CEMENT BY DISTRICTS  
[Quantities in thousands of barrels]

(U. S. Bureau of Mines, Revised, Jan. 18, 1933)

Districts	Production			Shipments	
	1932	1931	1932	Estimated value, 1932	1931
Eastern Pennsylvania, New Jersey, and Maryland . . . . .	16,095	28,640	17,169	\$16,650,000	28,853
New York and Maine . . . . .	6,602	10,309	6,522	6,814,000	10,741
Ohio, Western Pennsylvania, and West Virginia . . . . .	6,599	11,564	7,144	6,502,000	11,549
Michigan . . . . .	4,329	6,133	4,888	4,446,000	7,169
Wisconsin, Illinois, Indiana, and Kentucky . . . . .	10,573	15,174	11,252	7,968,000	16,938
Virginia, Tennessee, Alabama, Georgia, Florida, and Louisiana . . . . .	5,591	12,307	5,816	6,644,000	12,311
Eastern Missouri, Iowa, Minnesota, and South Dakota . . . . .	8,972	12,968	9,848	8,586,000	12,272
Western Missouri, Nebraska, Kansas, Oklahoma, and Arkansas . . . . .	5,651	9,182	5,522	5,061,000	9,633
Texas . . . . .	3,750	6,189	3,798	4,668,000	6,265
Colorado, Montana, Utah, Wyoming, and Idaho . . . . .	1,271	2,216	1,221	1,862,000	2,060
California . . . . .	5,508	7,740	5,731	8,266,000	7,496
Oregon and Washington . . . . .	1,568	3,007	1,666	3,368,000	2,864
Total . . . . .	76,509	125,429	80,579	80,885,000	127,151

United States, compiled by the U. S. Bureau of Mines, showed decreases of 39 per cent in production and 36.6 per cent in shipments from the totals for 1931. The production in 1932 was estimated at 76,509,000 barrels as against 125,429,000 barrels in 1931, and the shipments from mills in 1932 amounted to 80,579,000 barrels with an estimated value of \$80,835,000 as compared with 127,151,000 barrels shipped in 1931. During the calendar year 1932 the production related to capacity was 28.3 per cent as against 46.5 per cent in 1931. In addition to Portland cement, the production of clinker (unground Portland cement) in 1932 was 75,004,000 barrels as against 121,814,000 barrels in 1931.

The exports of hydraulic cement from the United States in 1931 aggregated 429,653 barrels valued at \$1,220,000, while the imports in the same year were 457,238 barrels valued at \$507,918. In 1932 the exports amounted to 374,581 barrels valued at \$802,205, and the imports amounted to 462,496 barrels valued at \$351,033.

**CENSUS.** The Bureau of the Census during the year completed the work of compiling the various reports of the Fifteenth Census of the United States. All of the final reports, consisting of 30 or more volumes, will be ready for distribution early in the year 1933, and some were printed in 1931 and 1932. The fifteenth is the most extensive census ever made of the United States. It was therefore necessary not only to employ a larger number of people but also to utilize a larger number of machines and to effect great improvements in the punching and tabulating equipment. The tabulation of the figures started with the punching of the cards on May 27, 1930. Since then and up to July 1, 1932, 330,322,208 cards were punched. These cards were passed through sorting, tabulating, and counting machines. The passage of the cards through these machines for the Fifteenth Census alone was equivalent to the handling of one card 4,430,658.896 times. The maximum number of punching and verifying machines used was 2225, and the sorting, tabulating, and duplicating machines used numbered 189.

According to the Report of the Director of the Bureau of Census for the fiscal year ending June 30, 1932, the contents of the various volumes comprising the five major divisions—population, agriculture, manufactures, distribution, construction—are reviewed in the following brief descriptions.

**POPULATION.** Volume I of the Fifteenth Census Reports on Population, giving the 1930 population of the United States by States, counties, and townships or other minor civil divisions, with separate figures for all cities and other incorporated places, was published on May 14, 1931.

Volume III of the Population Reports, parts 1 and 2, was published in April and May, 1932. In this volume the population is classified by color, nativity, sex, age, marital condition, illiteracy, and school attendance; the foreign-born white by citizenship; the foreign-white stock by country of origin; and gainful workers by sex and industry groups. Figures are presented for States, counties, and the larger cities in considerable detail, with data for urban, rural-farm, and rural-nonfarm areas; and in condensed form for townships and the smaller incorporated places down to 1000 inhabitants.

At the end of June, 1932, copy for Volume II, the General Report on Population, had been com-

pleted. This volume presents the population statistics arranged by subjects rather than by States (as in Vol. III) and covers a number of classifications not presented at all in Volume III or in the State bulletins out of which that volume was made up. These include State of birth of the native population, mother tongue of the foreign-born white, year of immigration, and ability to speak English. Other classifications, such as marital condition, school attendance, and country of origin are presented in greater detail and in significant combinations with other subjects.

**Occupations.** A preliminary tabulation was made for the counties and for the larger cities of each State, showing the number of gainful workers, by sex, in about 50 industries and industry groups, with the workers in agriculture further distributed by occupation. The results are included in Volume III of the Reports on Population.

Volumes IV and V are devoted entirely to occupation statistics. The statistics in Volume IV, for the most part, were published in a series of State occupation bulletins, presenting, for the State and for each city of 25,000 or more, statistics relating to the number, sex, color, nativity, age, and occupation of all gainful workers, and to the marital condition of gainfully employed women. These State bulletins, with a summary for the United States, make up the volume.

Volume V contains consolidated tables for the United States covering the classifications given by States in Volume IV, with additional detail in many cases, particularly in age. Volume V also includes statistics for the entire United States, showing for each of the more important industries and for each service group—public service, professional service, and domestic and personal service—the total number of workers, classified by occupation, sex, color, nativity, and age.

**Families.** The results of the tabulation of the special family card are published in a series of State bulletins which make up Volume VI of the Reports on Population. In these bulletins families are classified according to color and nativity of head; tenure of home; value or monthly rental of home; size (number of related persons in family); number of children; number of gainful workers; number of lodgers; age of head; and employment status of home maker, and presented for the State, urban, rural-farm, and rural nonfarm areas, and for cities of 100,000 or more. Data on all except the last four classifications named are also presented for counties and for smaller cities and other urban places.

**Unemployment.** Volume I, on unemployment, which presents the data by classes, for States, counties, urban and rural areas, and cities, was published in January, 1932. This volume gives the data in simple tabulations by sex and by age, by period of idleness, by reason for idleness, by family relationship, and by industry group.

**AGRICULTURE.** Volume I gives statistics of farms by townships or other minor civil divisions, with totals for counties, States, and the United States. Figures are shown for the number of farms, acreage classified according to use of the land, and the value of farm land and buildings, farmers' dwellings, and implements and machinery. The volume was published on Jan. 6, 1932, being a binding together of a series of State bulletins, with a United States summary. This is

the first time any farm statistics have been shown for minor civil divisions since 1870, having been tabulated in response to the general demand of agricultural colleges and other agricultural interests.

Volume II presents for States, by counties, the statistics of farms, farm acreage, farm values, mortgage debt, taxes, cooperative marketing, farm expenditures, machinery and facilities, movement of farm population, livestock and livestock products, and crops. The farms are classified by color and tenure of farm operator and by size of farm. This volume is issued in three parts, for the Northern, Southern, and Western States, each part also containing a summary for the United States, by States, with condensed tables for the North, the South, and the West. Part 3 was published on June 30, 1932.

Volume III presents by type of farm, statistics on farms; farm acreage and value; value of farm products, sold, traded, or used by operator's family; livestock and livestock products; size of farm; tenure of farm operator; and farm expenditures for feed, fertilizer, and labor. Figures are given for States by counties, with summary tables for the United States by States. The farms are classified in 12 major types and 5 subtypes, based primarily on the source of income; that is, the value of products from a particular source in relation to the value of products from all sources. This is a new departure in census statistics, except for a somewhat similar classification in 1900. The figures are of particular interest and value, as they disclose for the first time the relative importance of different agricultural groups in the United States.

Volume IV is the general report by subjects for the United States by States. A separate chapter is devoted to each subject or group of subjects. In addition to the items carried in Volumes II and III, this volume classified farm operators by race, age, number of years on farm, and days of other occupation, and gives figures on purebred livestock, animals slaughtered, and hides and skins sold. For the first time statistics of chickens and eggs, cows and milk, swine, and sheep are classified by size of flock or herd. Analytical tables, with averages and percentages and comparative data for earlier censuses, are also given.

**Horticulture** As the general farm schedule carried only two inquiries relating to nursery and greenhouse products, the horticultural organizations urgently requested that this information be supplemented by a census of horticulture to be taken as a part of the Fifteenth Decennial Census. The canvass was made by mail after the regular census enumeration had been made. The results for the United States, by States, are presented in one volume. Figures relating to area, value, equipment, expenditures, employees, receipts from sales of products, and type of organization are given for greenhouses, nurseries, bulb farms, seed farms, mushroom establishments, and blueberry farms. The figures for flowers and vegetables grown under glass, flowers grown in the open, bulbs, and flower and vegetable seeds are classified by kinds.

**Irrigation of Agricultural Lands.** The census of irrigation was confined to the 19 States in the arid, semiarid, and rice-growing sections of the United States in which irrigation is a recognized feature of agricultural practice. The results are published in one volume, composed of four sec-

tions. The first section contains a general discussion of the results. The second section classified land under irrigation and investment in irrigation enterprises by date of beginning of enterprise, source of water supply, character of enterprise, and drainage basin, and gives figures for irrigation works, cost of maintenance and operation, etc. The third section classified by tenure the acreage and value of all farms and of irrigated farms, and shows the number of all farms and of irrigated farms by type of farm, size, and value of products sold or traded for the United States, and for the 19 irrigation States, by counties. The fourth section presents a summary of irrigated crops, by States and counties.

**Drainage of Agricultural Lands.** The census of drainage was confined to the 35 States having organized drainage enterprises. The volume consists of three sections, the first section giving a general discussion of the results and special factors affecting drainage. The second section presents for the States, by counties, and a summary for the United States, figures on land, capital, drainage works, etc. The third section consists of a synopsis of State laws for establishing, organizing, financing, and maintaining drainage districts.

**MANUFACTURES.** This biennial census covering the operations of manufacturing establishments during the year 1929 was taken as a part of the decennial census of 1930, and its reports, in three volumes, are included in the Fifteenth Census series.

Volume I is general in character and gives statistics for the United States as a whole, by industries and by States. The subjects covered are: General summary; personnel; size of establishments; type of organization; power equipment; fuel and purchased electric energy consumed; industry groups; areas, counties, and cities; detailed general statistics.

Volume II is an assembly of the detailed industry reports, preceded by a general summary covering all industries. All these reports were published separately in pamphlet form. Most of them give detailed statistics in regard to production, and many show also the quantities and the costs of important materials consumed. All include statistics on number of establishments, number and compensation of employees, cost of materials, cost of fuel and electric energy, value of products, and number and rated capacity of prime movers, generators, and electric motors in use.

Volume III consists of an assembly of the reports for individual States, preceded by a general summary for the United States. These State reports, which were issued separately in pamphlet form, include statistics by industries for "industrial areas" (each comprising one or more counties in which there is great concentration of manufacturing industry) and for important counties and cities, and give summary figures for cities having 10,000 inhabitants or more, and for counties. Among the statistical items appearing in this volume are: Number of establishments; number and compensation of employees; cost of materials; value of products; number and rated capacity of prime movers, generators, and electric motors; quantity and cost of fuel and electric energy consumed.

**DISTRIBUTION. Retail Trade.** The volume concerning retail trade is composed of three parts. It contains data for retailers for the United

States and for States, counties, and cities down to 1000 population. The statistics cover the number of stores; the number of employees, distinguishing full-time and part-time; total payroll, distinguishing payments to full-time employees and to part-time; the total net sales; value of stock on hand at the end of the year; number of proprietors and firm members not on payroll; expenses, showing separately total payroll, wage value of proprietors' services, and rent paid for leased premises, but not including the cost of merchandise sold. The number of stores and annual net sales are classified by kind of store, distinguishing grocery stores, furniture stores, dry-goods stores, etc.; also by type of operation, distinguishing single-store independents, two and three store independents, local chains, sectional chains, and national chains. The stores are also classified by size of business. There is also included an analysis or breakdown by sales of commodities in so far as such data could be obtained from the retail merchants.

**Wholesale Trade.** The volume on this subject presents statistics for wholesale establishments for the United States, each State and large city, and for each county and for many small cities. It shows the number of establishments; number of employees; total salaries and wages; total expenses; value of stocks on hand; net sales, amount and per cent of net sales; sales at retail to ultimate consumers; sales to industrial consumers. These statistics are given by kind of business and by type of establishment. The number of establishments, number of employees, salaries and wages, total expenses, and net sales are also given by character of organization, distinguishing individual proprietorships, partnerships, corporations, and cooperative associations. The number of marketing units are likewise shown, with the number of establishments, their net sales, and total expenses given by unit groups. Employees engaged are distinguished as salesmen, executives, and all other employees. Wholesale merchants proper, as distinguished from brokers, commission merchants, etc., are classified, according to annual volume of net sales and by kinds of business. Commodity sales and commodity coverage are shown in considerable detail.

**Trade Reports.** The trade reports bring together statistics for single trades and contain a material amount of analytical text relative to the data. The economic and other special reports contain still more analytical material and cover such phases of distribution as employment, operating expenses, and practical utilization of distribution for business uses.

**Hotels.** The report for hotels is an octavo volume of 107 pages. It contains statistics for the United States, States, and cities of 250,000 or more inhabitants, showing number of hotels having 25 or more guest rooms, number of guest rooms, type of ownership, seating capacity of dining rooms, receipts, number of employees, salaries and wages paid, proprietors and firm members, by plan of operation and type of occupancy.

**CONSTRUCTION.** The report of the construction industry contains statistics for the United States, for each State and each city of 100,000 population or more, and for each county wherever practicable. It shows the number of establishments; value of construction business, distinguishing that done under general contract from that done under subcontract, as well as

business in the home city, in the home State, and outside the home State; principal expenditures, including amounts paid for subcontract work, for wages, and for cost of materials, also amounts paid for salaries, for rent, interest, contract bond premiums, and compensation and liability insurance premiums; cost of equipment purchased during the year and inventory value at end of year; number of proprietors; number of salaried employees; and number of wage earners. The number of wage earners employed is shown for each month of the year. The cost of materials furnished and used is given by kind of materials. Statistics are shown separately for general contractors and for subcontractors, and are further broken down with respect to type of work, distinguishing various classes of contractors, such as building, highway, bridge and culvert, grading, etc. There is also a classification of contractors on the basis of the amount of business done presented separately for six value groups (\$25,000 to \$100,000, \$100,000 to \$200,000, etc.).

**ABSTRACT OF THE FIFTEENTH CENSUS.** The most significant statistics in the reports of the Fifteenth Census have been selected for publication in a convenient summary volume for use as a home and office reference book. This abstract is an octavo volume of 1100 pages. It contains statistics of population, occupations, unemployment, agriculture, irrigation, drainage, manufactures, mines and quarries, wholesale and retail distribution, construction, and hotels. For the United States as a whole, the abstract will present information on these subjects in considerable detail, but the presentation by counties, cities, and other civil divisions is necessarily limited.

**CENTRAL AMERICA.** The term generally applied to the southern portion of the North American Continent lying to the north of the Panama Canal and south of the Isthmus of Tehuantepec in Southern Mexico, and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador, and the British crown colony of British Honduras. See the articles on these respective countries; also **ANTHROPOLOGY**; **ARCHAEOLOGY**.

**CENTRAL ASIA.** See **SOVIET CENTRAL ASIA**.

**CENTRAL AUSTRALIA.** See **NORTHERN TERRITORY**.

**CENTRAL STATIONS.** See **BOILERS**; **DYNAMO ELECTRIC MACHINERY**; **POWER PLANTS**; **STEAM TURBINES**.

**CENTURY OF PROGRESS INTERNATIONAL EXPOSITION.** Beginning June 1, 1933, and remaining open until November, the citizens of Chicago have announced an international exposition to be devoted to (and named) *A Century of Progress*, and at which it is intended shall be shown the accomplishments in science, art, and industry that have been achieved in the hundred years since the incorporation of the town of Chicago in 1833.

The site selected for the mammoth display is in part the lake front of the city lying between Twelfth place and Thirty-ninth street and the man-made Northerly Island, connected with the mainland by causeways and esplanades. The area in all comprises 424 acres. The financing of the exposition was given in the 1931 *YEAR BOOK (EXPOSITIONS, Chicago Exposition)*, together with a brief statement of the buildings to be erected and opened to the public.

The progenitors of the exposition have shown

great ingenuity in dramatizing every artifice of appeal to popular support, and have announced—in keeping with the high development of science—that the official opening will be accomplished through utilization and amplification of the light rays of the star *Arcturus*, rays that left the star forty years earlier, during the Columbian Exposition at Chicago in 1893.

The intent of the exposition is not to be merely for display, nor for amusement, nor for historic interest, though none of those features is to be sacrificed; but rather the educational and instructive note is given prominence. New wonders of science and industry, new homes, and household equipment, new comforts and necessities, new architectural design, new uses of color and light, and even new types of recreation are to be presented. The sponsors realize that changing conditions throughout the world have introduced new factors into the social structure, and are endeavoring to make the exposition expressive of the needs of the present generation and a forecast of the future.

Of all the unique features of the exposition, that of its architecture is one of the most interesting (see accompanying illustrations). Most of the exhibition buildings are windowless—a feature which permits economy of construction and allows constant control over the interior illumination. The architecture depends for its character and effectiveness on planes and surfaces rather than on intricate detail. This calls for the use of color as decorative motifs rather than cut-up surfaces with superimposed embellishments, such as have been used by many expositions of the past. The type of materials employed has influenced to a certain extent the architecture of the buildings.

The exposition is using prefabricated building materials to a large extent, applied to the steel frames. It is making use of some new building materials and new uses of old materials. The outside walls of the Administration Building, for instance, are of asbestos cement board, hitherto used chiefly for insulation purposes; the walls of the Travel and Transport Building are made of sections of sheet metal, clipped or welded to the steel frame; the Agricultural Group; the Federal Building; the Hall of the States; the Electrical Group; and the General Exhibits Group utilize standard gypsum board for their exterior walls with a coat of metallic paint. The walls of the Hall of Science are of plywood—a veneer of five thicknesses.

The Administration Building, of lofty ceilings, high windows, warm colors, and advanced forms of illumination, was the first exposition building to be designed and completed. In the form of a huge letter "E" with the three wings of the open side facing a lagoon and the closed side paralleling Leif Eriksen drive, one of Chicago's waterfront boulevards, this building combines the practical with the decorative in architecture. The building is 350 ft. by 150 ft., of modernistic design and located on sloping, filled-in land. Two of its most remarkable features are a great entrance lobby or exhibit hall in which models are displayed as they develop, and a Trustees' Room in the central wing in which distinguished guests are received and entertained.

One of the most remarkable of the new architectural concepts is found in the Travel and Transport Building, also opened in 1932. A unique departure in construction practice is evident in

the structure of the dome. With a clear interior diameter of 206 ft. and approximately the height of a twelve-story building, the roof of the dome itself is entirely clear of pillars or other interior supports. Instead of being supported from below, the roof is suspended by cables attached to twelve huge steel towers ranged in a circle. The absence of interior supports provides some obvious advantages for an exhibit hall. The main Travel and Transport Building is 1000 ft. long, windowless and two stories in height. The absence of windows permits continuous control over interior illumination, an advantage to exhibitors and visitors alike. In the dome and in the main Travel and Transport Building will be exhibits telling the story of transportation's progress via railway, automobile, airways, and waterways in the past century.

The Hall of Science promises to be one of the most talked-of buildings of the Fair. This is a great U-shaped building planted over Leif Eriksen drive, with two long arms reaching down to the lagoon. The Hall of Science is a two-story structure, 700 by 400 ft. with a mezzanine and a great ramp leading up to its northern side. Within the U space, which is like a quadrangle with an open end, a beautifully designed rostrum is provided which will be covered with bas relief ornaments. A tower approximately 176 ft. high rises in the southwest corner of the court, fitted with a carillon which records the time of day with its chimes and plays a wide variety of tunes on its tubular bells. In the Hall of Science the story of the epochal discoveries of science which have helped transform the world in the past century will be unfolded.

Opposite the Hall of Science on Northerly Island rises the Electrical Group. This group, 1200 ft. long and 300 ft. wide, is composed of three units—the Radio Building, the Communications Building, and the Electrical Building. The Radio Building is a rectangular structure 250 by 100 ft., at the northern end of the group; the Communications Building is a square-shaped structure connecting the Radio and Electrical Buildings; the Electrical Building is a three-quarter circular building surrounding a court and rising from a series of terraces. Back of this court is a hall 60 ft. high and 500 ft. long. Sculpturing, hanging gardens, gay colors, spectacular illumination, fountains, steel trees and unique landscaping effects provide features of high interest in this strikingly modern group.

The Agricultural Building on the northern end of Northerly Island near the Adler Planetarium is 625 ft. long. Its width varies from 112 to 195 ft., and its height is 45 ft. It is of modern architectural design. A central corridor or nave which runs the entire length of the building and is expressed above by a horizontal crowning member is the controlling feature of the design. From the west side, or entrance side of this nave, three main halls or chapels step down for major exhibits. On the east side there are three pavilions leading off the nave which are of less accented height.

The first three pavilions of the General Exhibits Group lie south of the Hall of Science on the mainland and are connected to it by means of a bridge on the upper level. The group is a sort of comb-shaped structure, running north and south, 686 ft. long and 97 ft. wide, with three pavilions 160 ft. wide extending east from the main structure. The pavilions are separated by courts 120

ft. wide. In these courts, pools fringed by trees and shrubbery will mirror the reflection of the pavilions.

On Northerly Island, north of the Electrical Group, the construction of the Federal and States Buildings has been undertaken. These buildings are to be erected in juxtaposition, to symbolize the essential unity of the Federal and States governments. The Hall of States, not completed in 1932, will be a horseshoe shaped structure, its form modified by the use of bays and recesses. It will be two stories high, 500 ft. across at the base and with its two arms 500 ft. long and 140 ft. wide at the widest point. The open part of the horseshoe will face west and enclose a court, landscaped and containing a sunken garden with a triangular pool. Opening on this court will be entrances to the various State and territorial exhibits. Across the base of the horseshoe will extend the Federal Building, 620 ft. long by 300 ft. wide, with a rotunda, 70 ft. in diameter and surrounded by a 75-foot dome, rising from its centre. Arranged around this dome will be three 150-foot towers, triangular in section, fluted and their inner faces curved to leave room for the dome. These towers will represent the three branches of government—administrative, legislative, and executive. The towers of the Federal Building will be silhouetted at night by means of unusual lighting effects. A feature of the Federal and State exhibit will be a geograph, or relief map, of the United States, which, on the scale of one inch to the mile, will give all physical features of the country at a glance.

The replica of old Fort Dearborn, reconstructed at Twenty-sixth street and the Lake Front from the original specifications of the war department of more than a century ago, provides graphic visualization of human progress in the past century. Its log battlements stand in vivid contrast to the skyscrapers of Michigan Boulevard, a short distance away. The Fort is furnished in true pioneer fashion. Priceless curios obtained through the assistance of the Smithsonian Institution, the Daughters of the American Revolution, the Chicago Historical Society, the Army and Navy, bring back the atmosphere of the days when Fort Dearborn and a half dozen buildings outside its stockades were all that there was to Chicago.

The Lincoln group, located just south of old Fort Dearborn, provides an interesting contrast. Here within the stockade is a reproduction of the log cabin birthplace of the Great Emancipator in Hodgenville, Ky. Nearby are reproductions of Lincoln's boyhood home in Indiana; the Lincoln-Berry Store in New Salem, Ill., where the young rail-splitter sold calico and molasses, learned of Robert Burns and Shakespeare and studied law; the Rutledge Tavern where Abe met and had his tragic courtship with Ann Rutledge; the Wigwam, or rambling frame convention hall where Lincoln was nominated for the presidency in 1860, and reproductions of rooms in his Springfield home.

On the mainland, just west of the Hall of Science, is the Golden Pavilion of Jehol—a reproduction of a famous Chinese Lama temple, shipped thousands of miles across the sea. It is a scintillating creation in red lacquer and gold with a double-decked roof covered with copper shingles finished with pure leaf gold. Inside, a priceless collection of Chinese and Buddhist treasures will be shown, including bronze and gilded

images of Buddha, altar pieces, incense burners, drums, temple bells, masks used in sacred dances, priestly robes, rare tapestries, parchments, hangings, etc.

One of the most fascinating aspects of the 1933 World's Fair will be the illumination of the grounds at night. A Century of Progress Exposition promises to write new history in the science of lighting. The foremost illumination experts of the United States are collaborating to make this exposition a great illumination spectacle. The resources of electric companies, their most recent discoveries and equipment are being made available. During the Fair the lake front will be transformed into a multi-colored panorama of light, bathing the buildings in mellow tints and projecting an ever-changing series of spectacular illumination effects. These effects can be made visible for miles out on Lake Michigan and up and down the shore line.

In the shadow of the replica of old Fort Dearborn, a modern housing exhibit will demonstrate the latest and most practical methods of providing living quarters. A group of eight exhibit houses utilizing new materials, new uses for old materials and novel construction methods, designed by America's foremost architects will be a feature of this exhibit. These houses are expected to set new trends in architecture, in furnishings, and equipment. Allied with the houses will be exhibits of building materials and methods of construction.

A Century of Progress Exposition will not simply be an instructive and educational celebration. There will be lighter features to delight people of all ages. The world has been searched for new and unusual features that will satisfy the thrill seekers. The 1933 Midway extends from Twenty-third street south to about Thirty-first street on the grounds of A Century of Progress Exposition. A number of these attractions were operating there in 1932 and thousands of visitors every week visited the Fair grounds in the summer and fall to view the Midway in the making.

On the lagoon gayly colored launches carried visitors on a tour of inspection from the water. "Dodgem" boats operated by the passengers themselves were in service during the summer and fall. In the air, the Goodyear blimp *Puritan*, made sightseeing trips over the grounds. In the lagoon, off Twenty-third street, Admiral Byrd's Antarctic ship, *The City of New York*, rode at anchor. The ship has a highly romantic history. She was built in 1882 and was christened *The Samson* when she slid from the ways at Arendal, Norway, because of her strength and massive construction. Her sides are of 3 foot-thick greenheart timbers from Norwegian forests. Her bow is 12 ft. thick.

Blue and white motor busses were operated on the exposition grounds. These busses have a seating capacity of 90 persons each and the seats face outward so that passengers may easily view the sights as they travel. During the Fair these busses will be operated over high-speed express and slow-moving sightseeing routes. Electrically propelled chairs and push chairs will provide other transportation. There will be speed boats, gondolas and other craft on the lagoons and Lake Michigan. Moreover, dirigibles and planes in the air will provide additional transportation.

The supreme in amusement thrills will be the "Sky Ride," construction of which was under way in 1932. Two steel towers 600 ft. high will

CENTURY OF PROGRESS  
INTERNATIONAL EXPOSITION

PROPOSED LAY-OUT OF A CENTURY OF PROGRESS INTERNATIONAL EXPOSITION, CHICAGO

ELECTRICAL BUILDING

THE HALL OF SCIENCE

GENERAL EXHIBITS GROUP

REPLICA OF GOLDEN TEMPLE OF JEHOI

CENTURY OF PROGRESS INTERNATIONAL EXPOSITION, CHICAGO

be connected by cables carrying rocket cars at the 200-foot level. One of the towers will be located near Sixteenth street on the mainland. The other will be 2000 ft. distant across the lagoon on Northerly Island. High-speed elevators will carry passengers sixty stories aloft to observation platforms at the tops of the towers, whence they will be able to view Chicago and the surrounding area. At the 200-foot level, two tracks comprising four cables each will connect the towers. Eight rocket cars will operate on these tracks. The cars will be 33 ft. long, of glass and aluminum and double-decked with seats arranged lengthwise. Colored steam will be discharged in the wake of the cars, giving them the appearance of vivid rockets. At night the towers and rocket cars will be illuminated in spectacular lighting effects.

A reproduction of a Mayan temple—the famous Nunnery at Uxmal in Yucatan—as it looked in the time of its glory 1000 years ago, is planned. This temple, naturally, is not designed as an amusement feature, but should prove just as spectacular an attraction as any of the amusement thrillers. It represents the greatest achievements of early man in America—the finest example of pre-European culture on the continent. Built by American Indians more than 500 years before Columbus set sail, the architecture of this temple equals any structure built in the classic age of Greece or in modern times.

A place where children may play while parents are sightseeing is being constructed on Northerly Island, between the Electrical Group and Hollywood-at-the-Fair. It will occupy approximately five acres. The name of this land of play is "The Enchanted Island."

Plans have been laid for a series of musical programmes under the sponsorship of the National Conference of Music Supervisors. And, in addition to these programmes, bands and community singing will be fostered. At Soldiers' Field Stadium and in the Lagoon various international sports will be staged.

All the preparations essential to a great international exposition were well in hand by the end of 1932, including provisions for the comfort, safety, and relaxation of the visitors. Twenty-six miles of piping for a sanitary sewerage system and storm sewers and water pumping facilities for 1,000,000 persons a day were installed. A water pumping and piping system with a capacity of 28,000,000 gallons per day was provided for the grounds from Twelfth place to Thirty-ninth street on the mainland and on Northerly Island, fringing the mainland site.

**CEREALS.** See BARLEY; OATS; RYE; WHEAT and article on each country under *Production*.

**CEYLON**, sē-lōn'. An island crown colony of Great Britain off the southern tip of India, occupied in turn by the Portuguese and Dutch previous to its annexation by the British in 1796.

**AREA AND POPULATION.** With an area of 25,332 square miles, Ceylon had a population (exclusive of military and shipping), of 5,306,863 at the partial census held Feb. 26, 1931. Registered births in 1930 numbered 205,106; deaths, 133,708; marriages, 25,505 (exclusive of Moslem marriages). The population of the chief cities (exclusive of the military; shipping, and estates) in 1931 was: Colombo, the capital, 284,155; Jaffna, 45,708; Galle, 38,424; Kandy, 36,541. Education is free in the vernacular schools; attendance in primary schools in 1930 was 572,237.

**PRODUCTION.** Ceylon is primarily agricultural, with about 3,200,000 acres devoted to the cultivation of rubber, tea, rice, cacao, tobacco, coconuts, spices, areca nuts, and sugar cane. About half of the population's rice needs is imported. Live-stock in 1930 included 1,660,000 cattle, 181,000 goats, 57,000 sheep, 45,000 swine, 1000 tamed elephants, and 2000 horses. A total of 52 plum-bago mines were in operation in 1930 and some monazite and small-gem deposits are exploited. Manufacturing is confined to the production of such agricultural commodities as coconut oil, cacao, rubber, etc.

**COMMERCE.** Foreign trade experienced a marked decline in 1931. General imports were valued at 218,300,000 rupees (1 rupee averaged \$0.3369 in 1931). Domestic exports totaled 322,972,000 rupees. The United Kingdom in 1931 took £11,994,998 (£1=15 rupees) of the exports and furnished £2,703,248 of the imports. A tariff system giving preference to British imports was authorized by the State Council on May 25, 1932; the decision had the effect of curtailing large imports of Japanese cotton goods.

**FINANCE.** After showing a steady increase from 1920-21 to 1927-28, government revenue and expenditure declined sharply in 1928-29. Exclusive of railway earnings and expenses, revenue in 1929-30 totaled £7,395,124 and expenditure £7,358,568. Railway revenue was £1,976,712 and railway expenditure £1,524,088. The net public debt on Sept. 30, 1930, was £15,639,693, and 3,000,000 rupees, or a total of about \$62,532,000. The unit of currency is the silver rupee of British India, with a par value of \$0.365.

**COMMUNICATIONS.** Ceylon had 951 miles of railway in 1929 and (in 1930) a total of 15,911 miles of highways, of which 4909 miles were macadam. Shipping entered and cleared in 1930 totaled 24,992,939 tons.

**GOVERNMENT.** The administration of the island is in the hands of a governor, assisted by an executive council of 10 ministers (7 elected, and 3 officers of state—chief secretary, legal secretary, and financial secretary), and a legislative council of 61 members, of whom 50 are elected. The colony is divided into nine Provinces, each administered by a Government Agent. A new Constitution, increasing the powers of the legislative council, was adopted in 1930, and in June, 1931, was held the first general election in which universal adult suffrage was substituted for the former property and educational suffrage tests. Governor in 1932, Sir Graeme Thomson.

**MALDIVÉ ARCHIPELAGO.** The Maldivé Archipelago consists of 13 coral islets, 400 miles southwest of Ceylon. Inhabited by 70,000 Moslems (1921 census), they are ruled by a native sultan and pay an annual tribute to the Ceylon government. Millet, fruits, and edible nuts are the chief products.

**CHAMBER MUSIC.** See MUSIC.

**CHAMBER OF COMMERCE OF THE UNITED STATES.** A national federation of nearly 1400 business organizations, established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. The members of the chamber are trade associations and local or regional commercial organizations, these groups being represented on a board of directors, composed of 34

members chosen from geographical districts or specific fields of business and elected for a term of two years. The membership in 1932 consisted of 1378 business organizations, 4836 individual members, and 3501 associate members.

The policies of the organization are formulated only by resolutions adopted at its meetings or by direct referendum, in order that they may reflect as accurately as possible the opinion of all classes of business represented in the constituent membership. Among the questions to which the chamber is currently directing its attention are: agriculture and agricultural credit, amendment of anti-trust laws, banking, bankruptcy laws, commercial policies in foreign relations, depreciated currencies, distribution efficiency, government competition, government expenditures and taxation—Federal, State, and local, natural resource industries, sharing work for emergency purposes, stabilization of business and employment, trade and commercial organization, trade relations, transportation, immigration, railroads, Federal Reserve System, special insurance taxes, fire prevention, public and private employment exchanges, veterans' benefits, war debts, and water power policies.

For the convenience of its members the chamber maintains at its national headquarters 12 service departments, covering the main divisions of business activity. The agricultural department aids local chambers of commerce in the solution of agricultural problems and the enhancement of trade-area prosperity. The civic development department aids business men to approve not only local municipal and civic development but also matters of general national importance. The commercial organization department assists member chambers in strengthening their organization and extending their usefulness to the communities which they serve. The department of manufacture assists local chambers with their problems of industrial extension. The domestic distribution department promotes better methods of distribution. The finance department studies methods of Federal, State, and local taxation and problems of corporation and international finance. The foreign commerce department deals with tariff policies and import and export problems. The insurance department works to secure a more enlightened public attitude toward the insurance institution. The natural resources production department deals with the problems of water power, oil, coal, forest, and other natural resources. The trade association department serves as a clearing house as to the activities which a trade association can carry out most effectively. The transportation and communication department studies problems of rail, highway, waterway, and air transportation and of postal service and electrical communications. The research department covers the general field of economic research.

The chamber publishes a monthly magazine, *The Nation's Business*, and issues from time to time reports on economic subjects. Its twentieth annual meeting was held in San Francisco, Calif., May 17–20, 1932. The officers elected for the year 1932–33 were: president, Henry I. Harriman, Boston, Mass.; honorary life vice-president, John Joy Edson, Washington, D. C.; vice-presidents, Matthew S. Sloan, Brooklyn, N. Y., Junius P. Fishburn, Roanoke, Va., Felix M. McWhirter, Indianapolis, Ind., F. Peavey Heffelfinger, Minneapolis, Minn., Nathan Adams, Dallas, Tex.,

Paul Shoup, New York City; members of the senior council, Richard F. Grant, New York City, John W. O'Leary, Chicago, Ill., Lewis E. Pierson, New York City, William Butterworth, Moline, Ill., Silas H. Strawn, Chicago, Ill.; treasurer, Oscar Wells, Birmingham, Ala.; chairman of the executive committee, Henry I. Harriman, Boston, Mass.; and secretary D. A. Skinner, Washington, D. C. National headquarters are in Washington, with divisional headquarters in New York City, Atlanta, Chicago, Minneapolis, Dallas, and San Francisco.

**CHAMBERS, REAR ADMIRAL FRANK TAYLOR**, U.S.N. An American naval officer and civil engineer, died in Washington, D. C., Nov. 10, 1932. He was born in Louisville, Ky., July 1, 1870. Upon his graduation from the Rensselaer Polytechnic Institute in 1892 he joined the structural steel department of Sneed & Co., Louisville iron workers, and three years later became associated with the Pittsburgh Bridge Co. He served also for a short time in the structural steel department of the office of the Supervising Architect in Washington. Commissioned a junior lieutenant in the Civil Engineers Corps of the U. S. Navy in 1897, he was promoted through the grades to rear admiral in 1927.

Chambers was a member of the Chesapeake and Delaware Canal Commission during 1905–06, of the National Advisory Board on Fuels and Structural Materials during 1906–07, and of the Army and Navy Board appointed in 1908 to study the possibilities of a deep draft ship canal between the Chesapeake and Delaware bays and also of a deep draft ship channel extending from the Golden Gate, San Francisco, to the Mare Island Navy Yard. After 1917 he was a member of the Navy Yard Commission, and the same year was put in charge of construction at the naval operating base at Hampton Roads, Va. In 1918 he became chief engineer and a member of the port facilities committee of the U. S. Shipping Board, visiting England and France in the latter capacity to inspect port and harbor facilities. He was consulting engineer on port facilities to the Board of Engineers for Rivers and Harbors of the War Department, and represented the Navy Department on the Association of Port Authorities. At the time of his death he was director of the Naval Petroleum Reserves and of the Naval Oil Shale Reserves.

**CHAUTAUQUA INSTITUTION.** An educational movement established in Chautauqua, N. Y., in 1874 by Lewis Miller and Bishop John H. Vincent, both prominent in the Methodist Episcopal Church. Its original idea was that of an assembly for Sunday school teachers, but it was gradually developed into an institution affording during the months of June, July, and August a series of correlated lectures and entertainments. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, concerts, operas, dramatic entertainments, and so forth; the summer schools, offering credit courses under the direction of New

York University; and a home-reading circle in which four or more outstanding books are designated for reading during the year, in addition to a news narrative appearing in a monthly review.

The attendance at the annual session approximates 40,000. Among the speakers at the general programme in 1932 were Mrs. Franklin D. Roosevelt; Gen. Frank T. Hines, Administrator of Veterans' Affairs; Miss Zona Gale, author; Dr. Mazo Nitobe, former Under-Secretary of the League of Nations; Mrs. Grace Morrison Poole, President General Federation of Women's Clubs; Mr. Louis J. Taber, Master of the National Grange; Dr. George E. Vincent, Dr. James G. McDonald, Dr. Edward Howard Griggs, Dr. Herbert Adams Gibbons and many others. Twenty-seven symphony orchestra concerts were given in the amphitheatre and many other programmes of music. Eleven performances of five operas were given in English under the direction of Georges Barrère, prominent in the Juilliard Graduate School of Music. There were also ten performances of five plays given by the Repertory Theatre, made up of members of the Cleveland Play House company. The summer school included 18 departments, with 100 instructors and approximately 1500 students. The National Broadcasting Company broadcast 21 Chautauqua programmes over a nation-wide hookup during 1932. The officers in 1932 were: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ranson, chairman of trustees; Shailer Mathews, chairman of the executive board; Charles E. Peirce, secretary; and Jessie M. Leslie, treasurer.

**CHEMICAL SOCIETY, AMERICAN.** See CHEMISTRY, INDUSTRIAL.

**CHEMISTRY.** It is said that during 1931, "about 60,000 additions to chemical knowledge were made, varying in importance from a report of increased precision in measuring the boiling point of some liquids to the discovery of two new elements." It would be difficult at this time to make so precise a statement in regard to the advances made during 1932, but from the items that follow sufficient will be shown to indicate that distinct advances have also been made during the period covered by this account.

**ORIGIN OF MATTER.** Studies concerning this interesting topic continue and the enigma as to the origin of life still attracts the attention of scientific observers. Sir Alfred Ewing, president of the British Association for the Advancement of Science, in his retiring address delivered at the York meeting in September said: "What we have to realize is that all matter consists of two kinds of electricity, protons and electrons, held apart we do not know how. If you ask, what is electricity? there is no answer save that it is a thing which exists in units of two sorts, positive and negative, with a strong attraction for each other, and that in any atom you will find them somehow held apart against that attraction, with a consequent storing of potential energy."

Some of the details of the progress made during the year are given herewith. A special cable from Cambridge, Eng., dated February 28, announced the discovery by Dr. James Chadwick of a new type of ultimate particle, consisting of a proton and an electron bound together without an electric charge and hence called a

"neutron." The discovery of the neutron was made in the process of investigating the atomic nucleus with the help of earlier researches by Miss Irene Curie, daughter of the discoverer of radium, and Prof. Robert A. Millikan, the investigator of the so-called cosmic rays. With the technic which has made the Cavendish laboratory world famous, Doctor Chadwick proceeded to bombard atoms of metal beryllium with radioactive rays known as "alpha" particles. "Myriads of alpha particles bounded off the atom, but one or two penetrated to the inside of the nucleus with curious effect. Normally the entry of an alpha particle causes the protons to escape from the atom, but in this case no protons escaped. There was simply radiation which was neither waves of light nor protons nor electrons. It arose neither from vibrations nor from positive or negative electric charges. The only explanation was that it was caused by neutrally charged particles which must be neutrons."

Many of the neutron's effects in passing through matter resembled those of the quantum of high energy. "But all the evidence so far has been in favor of the neutron. The quantum hypothesis can only be maintained if conservation of energy and momentum is relinquished at some point. Because neutrons are small and have no electric charge their range in the air is more than one mile and they can pass through many feet of lead. Carrying no electric charge, they are not repelled by charged atoms which they approach. They can find a way between atoms much more easily than protons and electrons." The "neutron" is one of the ultimate particles in nature, so small that it would take 200,000,000,000,000,000,000,000,000 to make a mass weighing an ounce. Neutrons are not waves but particles, but they have, as particles, hitherto unknown powers of penetration.

At a meeting before the Elisha Mitchell Scientific Society held in Chapel Hill, N. C., Dr. E. K. Plyler, of the University of North Carolina, announced a new theory of matter, describing his discovery of a tiny particle of light, that is, of energy, probably electrical, which he named "atomerg." Its presumable size is represented by a decimal point, followed by forty-seven ciphers and the figure seven. It is probable that most or all of the material things in nature are made of atomergs as building blocks. It is likely that matter, energy, electricity, magnetism, electrons, protons, and photons are simply different manifestations of bundles of atomergs. The atomerg would be much smaller than the neutron announced previously from Cambridge University. The neutron is made of one or more protons and electrons bound closely together, while the atomerg is only one of the particles composing either an electron or a proton.

In July it was reported from Princeton, N. J., that a project for the development along new lines of a generator capable of producing millions of volts of static electricity, to obtain high potentials with which to penetrate the nuclei of atoms, is to be built by Princeton University as part of its new research programme in fundamental physics. A month later came from Berlin, Germany, the announcement of success in another great atom-smashing goal of science—the disintegration of masses of atoms—made by the German General Electric Company. The new accomplishment takes a large amount of power, described as the entire output of the German

plant, and converts it into atom-smashing particles. The tube was built by Fritz Lange and Arno Brach. It is a 5,000,000-volt X-ray tube, made by "cascading," that is, by hooking together, end to end, several X-ray tubes. Each unit of this cascade, according to the brief announcement, is 2.40 meters long, about eight feet. But how many are hooked together is not mentioned. The cascading idea is credited to the American physicist, William D. Coolidge, of the General Electric Company, who has used it in spectacular tubes. The cascading is employed to spread the tremendous electrical energy so that it does not destroy the tube containing it. Smashing, splitting, or disintegrating the atom into its component parts of negative electrons and positive protons, both of which are regarded as the ultimate units of matter, is the most stupendous problem engaging the attention of experimental physicists at present. It is the modern equivalent of the alchemists' search for "the philosopher's stone," with which it was hoped to achieve the transmutation of base metals into gold. To smash the atom would mean two achievements, which, should they ever be put into practical use, would result in revolutionizing life upon earth. For it would mean not only the realization of the age-old dream of the alchemists to transform one element into another but making available for the use of man the practically limitless energy known to be securely locked up inside the atom.

According to a cable dispatch from London, England, dated in May, Dr. J. D. Cockroft and Dr. E. T. S. Walton, working in the Cavendish laboratory at Cambridge University, succeeded in forming helium atoms electrically: "We found that at 120,000 volts some atoms we were bombarding by protons began to break up into helium. These helium atoms came out with energies of the order of 100 to 160 times that of the particles we were firing into them. We got the results in the last fortnight after nearly three years of work." The experiments were made in the high-voltage laboratory which Lord Rutherford developed. The experimenters employed voltages of between 120,000 and 600,000 to send millions of protons a second through a vacuum tube at a speed of nearly 4000 miles a second.

Later in the year came further efforts to penetrate the mystery of the origin of matter through the study of the cosmic rays and Arthur H. Compton and Robert A. Millikan had adventures in the unknowable. Compton's experiments were made in Arctic regions and Millikan's in upper air near home. And the culmination came when Compton asserted that the cosmic ray is not a wave, as Millikan thinks, but a particle.

**NEW ELEMENTS.** Further proof of his discovery of "element 87," which he has provisionally named "virginium," was presented by Prof. Fred Allison (see *YEAR BOOK* for 1931, p. 172) at a meeting of the American Institute of Mining and Metallurgical Engineers held in New York City on February 16. According to Professor Allison, "A question which has been of some interest for years was whether the power of a liquid to rotate polarized light is acquired instantly with the application of the magnetic field, or whether there is a very small interval of time which intervenes between the application of the magnetic field and the consequent rotation of the light by the liquid. In other words, whether there is a 'time lag' in the Faraday effect."

The velocity of light, 186,000 miles a second, was used as the timing device by Professor Allison. It was discovered that the presence of each metal, compound of metals, as well as the isotopes of metals, has its individual "time-lag" and that the presence of quantities as minute as one part in 100,000,000,000 will still show distinct time reactions on the magnetized beam of polarized light. In this manner not only the two missing elements were detected in sea water and a number of other minerals, but also what is known as hydrogen 2 and isotopes of gold, lead, and platinum. The magneto-optic method was begun in 1927 as the result of studies of what is known as the Faraday effect. Faraday discovered in 1845 that a beam of plane polarized light, when passed through a transparent, isotropic medium, when traversed by a magnetic field of force parallel to the direction of the light, suffers a rotation. Professor Allison's method was severely attacked at a meeting of the American Physical Society held in April, and a decided skepticism prevails over the authenticity of his results. Later, in May, Dr. William F. Meggers of the Bureau of Standards announced using a method which would reveal one part in ten million of the elusive element, which may be closely akin to and even more remarkable than radium, but he had been unable to find any trace of the material in the sample sent him for analysis. Although twice as heavy as ordinary hydrogen the isotope is not a new element, because the electric charge of its atom is exactly the same as that of the lighter substance. One electron and one proton are neutralized by being packed together in the nucleus so the charge depends on the other proton and the electron revolving in an orbit—which is precisely the same condition as obtains in an atom of ordinary hydrogen. The isotope exists in all hydrogen. It is colorless, odorless, and tasteless. It is exactly like ordinary hydrogen except for the differences revealed by the spectroscope. It exists in ordinary hydrogen in a ratio of about one part in 4000. The chief importance of the new hydrogen will be the study of the structure of the atom, and it will be especially valuable since the isotope is so far down on the atomic scale. It may give a clue to transmutation, and what is more important, to a way of utilizing atomic energy.

**HYDROGEN ISOTOPE.** The existence of an isotope of hydrogen had been announced but it was not until early in 1932 that the results of an investigation by Dr. F. G. Brickwedde of the United States Bureau of Standards were given. He obtained the new substance by "boiling" hydrogen at a point very close to absolute zero. First ordinary hydrogen gas was reduced to a liquid under intense pressure. Then the pressure was reduced to the point where the liquid changed into gas again—that is, "boiled." The ordinary hydrogen atoms, being the lightest, were released first in this process so that in the end all that remained was the hydrogen in this hitherto unknown form. Then the atomic structure of the new substance was determined by spectroscopic investigations made at Columbia University by Prof. H. W. Urey and Dr. G. M. Murphy. The atom of the substance concentrated by Doctor Brickwedde, shown by spectroscopic investigations, consists of two protons and two electrons. The protons and one of the electrons are packed together in the nucleus, while the other electron revolves in an orbit around it. Each one of these atoms is

exactly half of a helium atom. A single physical combination, by whatever means brought about, would account for the step from one element to another and the first step in the progress of the universe from an undifferentiated conglomeration of hydrogen to all the multiple forms of matter.

Subsequently at a meeting of the American Physical Society held in New Haven, Conn., in June, Dr. K. T. Bainbridge, of the Bartol Research Foundation at Swarthmore, Pa., reported that he had succeeded in measuring to an extraordinary degree of accuracy the weight of the recently discovered hydrogen 2, or the heavy hydrogen atom. A sample had been sent to Dr. Bainbridge, who immediately undertook to ascertain its weight. Using the mass spectrograph, he found that the mass of this new heavy hydrogen atom was less than that of the two ordinary hydrogen atoms of which it was made up. The loss in this mass might be placed at 2,000,000 electron volts. Dr. Bainbridge believes that his measurements display an error of only one two-thousandths of 1 per cent.

**NEW METHOD OF TREATING FLUORINE.** A new method of handling fluorine was reported at the New Orleans meeting of the American Chemical Society in April. Fluorine, ordinarily a pale green gas, is so active that even fluorine frozen solid and hydrogen liquefied at 422° below zero explode violently if brought together. Organic compounds exposed to the action of fluorine gas usually explode. Great re-activity, if it could be effected, would be a valuable asset, because it would cause fluorine to combine readily with many substances. The carbon tetrachloride is distilled off and the product remains stable and does not explode. One fairly definite product that was obtained is a combination of fluorine and naphthalene. The new product is gray and decomposes at a temperature of 352° F.

**SEX HORMONE ISOLATED.** At a meeting of the Royal Society of Canada, held on May 27, Dr. J. B. Collip announced his isolation of a sex hormone in pure form. He described the work conducted for years by a group of young scientists at McGill University, headed by himself, during his presidential address to the biological sciences section of the Society. Hormones are the secretions of the ductless glands. They are health regulators and include control over sexual developments. During a discussion regarding the hormone in relation to the pituitary and other ductless glands, Dr. Collip said it was indicated that these glands were intimately interrelated chemically. The pituitary gland was the master gland of the human system. It is reported that the next problem will be to accumulate this hormone in its pure form in sufficient quantities to make it accessible to physicians for use in child-birth.

**NEW HORMONE FROM PITUITARY GLANDS.** The discovery of a new hormone by Dr. Oscar Riddle, Dr. Robert A. Bates and Simon W. Dykshorn of the department of genetics of the institution, at Cold Spring Harbor, L. I., was announced on August 7 by the Carnegie Institution of Washington. This hormone is found to have been produced by the anterior pituitary gland in addition to the growth and the gonad stimulating hormones, already recognized by most investigators. The new hormone, for which the name "prolactin" is proposed, has been shown to be the particular substance produced by the pituitary gland which

is necessary for the secretion of milk in mammals and also for the production of the "crop milk" of pigeons. The substance regarded as a new hormone has been obtained from the pituitary glands of cattle and sheep, and by appropriate chemical methods has been separated with fair completeness from the growth and the gonad stimulating substances with which it is mixed in the normal gland. Prolactin is somewhat less soluble than are the other two hormones and the separation is accomplished, in part, by its isoelectric precipitation. It is soluble, however, in one or another degree in acid, alkaline, and other media.

**DEVELOPMENTS WITH REGARD TO VITAMINS.** The great interest in these products, due to their value in nutrition, has resulted in their intensive study in various directions, the results of some of which are here given.

**Vitamin A.** Prof. F. E. Chidester of the University of West Virginia reported the discovery at the meeting of the American Association for the Advancement of Science of a synthetic substitute for Vitamin A, the growth factor. It is a combination of iodine, fats, and iron. Thus far it has been tried only on rats and the results were obtained simply by feeding them with their meals ferrous oxide, which contained the iodine and iron, and linoleic acid, which has the fats. Without forcibly feeding the animal, he demonstrated that for those that consume the linoleic acid and ferrous oxide combination there is apparent ability to synthesize Vitamin A.

In May came the announcement by Dr. F. B. Bowden and Dr. G. P. Snow of Cambridge, England, of the completion of a series of experiments which had produced Vitamin A from carotene, which is described as a reddish substance found in carrots, by treating it with ultra-violet rays. This evidence led them to believe they had succeeded also in identifying that part of the molecule of Vitamin B which causes its biological effects. A method of distinguishing between opposing theories regarding the nature of Vitamin C was another result of their work. It may determine whether the vitamin is made up of hexuronic acid or whether it is derived from narcotine by the action of light.

Later, J. B. Phillipson and J. W. Woodrow of the Iowa State College reported their ability to determine the approximate Vitamin A content of certain foods within a few minutes. Their experiments reveal that every substance known to contain the growth-producing vitamin absorbs the same rays of ultra-violet light when examined by a spectrometer. In the spectrometer, light is broken into its component rays of different wave lengths by a prism. By using a quartz prism the ultra-violet rays were allowed to pass through. When substances containing the vitamin are subjected to a test, a shadow appears in the spectrum where ultra-violet rays ordinarily would appear. The shadow is due to the Vitamin A absorbing these ultra-violet rays. Their experiments were performed with animal or vegetable oils placed in a small vessel with quartz sides, through which the light shone before entering the spectrometer.

In September a press dispatch from Cleveland, O., reported the discovery by Dr. A. F. O. Germann and his assistant, Dr. Harold M. Barnett, of a new process able to furnish a primary concentrate of Vitamin A at prices low enough for ordinary medical practice. In the Germann-

Barnett process the equivalent of a carload of vegetables, such as carrots, is required to produce an appreciable amount of the vitamin. Dr. Germann declined to reveal the exact details of the process, but said that it would be of important value both to medical practice and medical research.

**Vitamin B.** In January a dispatch from Göttingen, Germany, announced that Prof. Adolf Windaus, a Nobel Prize winner, in collaboration with Fritz Lager of the Dye Trust, has produced Vitamin B<sub>1</sub>, a constituent ingredient of Vitamin B, in pure crystallized form. Professor Windaus found a way of combining the vitamin with hydrochloric acid to form the hydrochloride. He also investigated its absorption spectrum to check up on its chemical composition, and he performed tests with the vitamin on pigeons. He found his preparation nearly four times as powerful as crystalline material isolated by earlier investigators who thought they had obtained the vitamin in pure form. Professor Windaus isolated the crystallized Vitamin B<sub>1</sub> in yeast, which is rich in B vitamins. He also succeeded after four years of experimentation in producing Vitamin D, the anti-rachitic vitamin, in pure crystallized form. Vitamin B stimulates the appetite and promotes good digestion and assimilation of food. An excellent source of the vitamin is wheat.

In May, Dr. Siegfried Maurer, associate professor of pathology at the University of Chicago, reported that results of his researches on Vitamin B indicate the food component has a pronounced influence on the ability to learn. Results of his experiments with white mice prove that a baby who does not get its share of Vitamin B will not learn as rapidly as one who does. The vitamin is found in wheat, spinach, yeast, and asparagus, and to a lesser degree in milk, oranges, and leafy vegetables. He found that the offspring of mice deprived of Vitamin B attained the normal level of learning ability when they were brought up on a diet rich in the food component. However, he found the infant mortality of the depleted animals was much higher than that of normal animals.

**Vitamin C.** Dr. C. C. King, professor of chemistry in the University of Pittsburgh, announced in April that he had isolated and identified Vitamin C, obtaining it from lemon juice, and had established its identity with hexuronic acid. It appears likely that Vitamin C must be present in the tissue in practically all higher animals and plants, in order for normal metabolism to proceed. It is particularly important to growth and tooth structure. It has some significance in relation to current malnutrition in children, but further work will be necessary to determine just how important it is. This discovery was confirmed by dispatches in *Nature*, which say that experiments by Drs. J. L. Svirbely and A. Szent-Györgyi of the University of Szeged, Hungary, show that anti-scurvy Vitamin C is the newly discovered hexuronic acid and further investigations are now being made to determine this finding definitely.

**Vitamin D.** In July it was announced that a process for the extraction of pure Vitamin D directly from cod liver oil has been perfected at Columbia University by Prof. Theodore F. Zucker after ten years of research and experimentation. The new product differs materially from the commercial equivalents of Vitamin D on the

present market. The latter products are artificial, being produced by exposing the substance ergosterol, found in ergot and yeast, to ultra-violet light. This irradiated ergosterol is a substance closely resembling Vitamin D, and has the same ricket-preventing properties as the vitamin, but is not the vitamin itself. Doctor Zucker's process is the first to extract the natural vitamin from the cod liver oil. The extract is in liquid form.

**Vitamin G.** According to a paper presented by Henry C. Sherman of Columbia University at the Denver meeting of the American Chemical Society on "Some Further Experiments with Vitamin G and a Discussion of its Probable Multiple Nature" he contended that a longer youth for the human race would be brought about by the food factor in Vitamin G, fresh conquests of disease and a general advance in the health of the world's population would ensue. He claimed: "That Vitamin G is needed to prevent the development of deficiency diseases like pellagra" is only the beginning of the story of the importance of Vitamin G in our food.

**INFLUENCE OF CHEMICAL COMPOUNDS ON DISEASE.** At a meeting of the Federation of American Societies for Experimental Biology held in Philadelphia, Pa., on April 29, Dr. Frederick S. Hammett announced that he had demonstrated unquestionably that the sulphhydryls were the fundamental chemical element in the growth of the malignant cell. Experimenting with white mice, he used one strain bred for tumor potentiality and another bred away from it. He found that when a sulphhydryl compound was applied to a member of the first strain, fatal tumors could be produced in members of the second strain, the chemical developed an overgrowth analogous to a cancerous tumor, but when the sulphhydryl stimulus was taken away the tumor disappeared. This work, extending over two years, "has definitely demonstrated that the sulphhydryl is the naturally occurring chemical group which is responsible for the cell division in tumors as in normal things, and that sulphoxide, which retards cell division in normal things, also retards cell division in tumors and tumorlike growth."

Another announcement that came from Berlin, Germany, to *Science Service* in September disclosed another influence that is helpful to a better understanding of the elusive factors that produce cancer. A second respiration ferment, one that is not the hürmin which controls the conveyance of oxygen from the lungs to the muscles and other tissues of the body, has been found by Prof. Otto Warburg, Nobel Prize winner, and his associate, Dr. Walter Christian of the Kaiser Wilhelm Institute for Biology. When certain cells, called "anaerobic" because they normally cannot live in the presence of oxygen, were shaken up with oxygen, a respiration of burning of carbohydrate took place. This respiration or breathing could not be stopped by carbon monoxide or by hydrocyanic acid, poisons which stop ordinary respiration in animals by acting upon the hürmin that controls that conveyance of oxygen in the body. Juices squeezed out of many other cells behave like anaerobes. In such juices the investigators also found respiration which could not be stopped, either by carbon monoxide or hydrocyanic acid. From these observations it was concluded that an oxygen-carrying ferment other than hürmin was to be found in nature. This second respiration ferment appeared to be

present in high concentrations in aerobic cells.

**BIBLIOGRAPHY.** The following are the more important books on chemistry published during the year: Archibald, *Preparation of Pure Inorganic Substances*; Clayton, *Colloid Aspects of Food Chemistry and Technology*; Curtis, *Fixed Nitrogen* (Monograph No. 59, American Chemical Society); Jamieson, *Vegetable Fats and Oils; their Chemistry, Production and Utilization* (Monograph No. 58, American Chemical Society); Kassel, *Kinetics of Homogeneous Gas Reactions* (Monograph No. 57, American Chemical Society); Luck, *Annual Review of Biochemistry* (vol. 1); Pringsheim, *Chemistry of the Monosaccharides and of the Polysaccharides*; Rossman, *Law of Patents for Chemists*; Sherman, *Chemistry of Food and Nutrition* (4th ed.); Winton, *Structure and Composition of Foods*, (vol. 1). See VITAMINS.

**NECROLOGY.** John Brown Francis Herreshoff, born in Bristol, R. I., on Feb. 7, 1850; died in Atlanta, Ga., on January 30; inventor of a process for manufacturing sulphuric acid long active in industrial plants, notably the Nichols Copper Company; first recipient in the United States of the Perkin Medal. Andrew Alexander Blair, born in Woodford County, Ky., on Sept. 20, 1848; died in Philadelphia, Pa., on January 25, chief chemist to the U. S. Geological Survey in 1879-81, but best known by his skill as an analytical chemist; author of *The Chemical Analysis of Iron* (1888). Charles Ford Langworthy, born in Middlebury, Vt., on Aug. 9, 1864; died in Washington, D. C., on March 3; a foremost worker on munition problems and long chief of the office of Home Economics in the U. S. Department of Agriculture in Washington. Wilhelm Ostwald, born in Riga, Latvia, on Sept. 2, 1852; died in Leipzig, Germany, on April 4; dean of the faculty of chemistry at the University of Leipzig and winner of the Nobel prize in chemistry in 1919; also author of important text books on his specialties. Sir Richard Threlfall, born near Preston, England, on Aug. 14, 1861; died in Edgbarton, England, on July 10; an industrial chemist known specially on account of his association with the development of the smoke screen and the so-called tracer bullet used during the World War.

**CHEMISTRY, INDUSTRIAL.** It is encouraging to note that "the chemical industries have successfully met the test of two full years of depression, and have showed that the immense expansion of the preceding decade was soundly based." Also, so far as trade conditions are concerned, not only has foreign trade been most gratifying but, in comparison with other industries, it has met the depression with good results. The official journal of the American Chemical Society reports that all and more than the present supply of chemists are needed to fill demands.

**AMERICAN CHEMICAL SOCIETY.** Owing to the economic depression, a depletion of the fund of scientific knowledge by the cessation of research in industrial laboratories, decline in supported scholarships, and the inability of qualified workers to continue post graduate study, a Federal subsidiary of research in universities and colleges by unemployed chemists was urged editorially by the *Journal of the American Chemical Society*. Idle research workers would be engaged in fundamental research in universities and scientific institutions, jointly subsidized by the Federal government and the universities. The

institutions would pay the full cost of laboratory materials and operating expenses. It is claimed that fundamental research has been neglected by universities and scientific institutions in recent years in favor of utilitarian research, since donations for research frequently were from industrial corporations, which required investigations in their special fields.

The 83d meeting of the American Chemical Society was held in New Orleans, La., during March 28 to April 1, at which 775 persons were registered and 203 papers were read before 15 divisions. It was announced that the award of the \$1000 prize of the society for 1932 for "the most promising young chemist, man or woman under 30, in North America, in recognition of the accomplishment in a university of outstanding research in pure chemistry" was made to Dr. Oscar K. Rice of Harvard University. The quest of the society for a "prodigy" each year is sponsored by a foundation established for that purpose by Dr. A. C. Langmuir, of Hastings-on-Hudson, N. Y. The award to Dr. Rice was made in recognition of work that involved the application of modern theories of physics to chemical problems, including the application of quantum mechanics to reactions between gases, and of modern theories of statistics to the studies of metals and electro-capillarity.

The many papers and addresses by research workers in the industries, universities, and technical schools at this meeting described the advances in the entire range of chemical science. The keynote of the meeting was "science in action for the industries," and problems arising as a result of the depression were discussed by representative men in science, industry, and education. The world's food supply, needs of the food industries, progress in public health and sanitation and science teaching in the schools and colleges were among the topics reported upon. Dr. R. T. Haslam, vice-president of the Standard Oil Development Company, presided over a symposium on "chemical engineering processes in the oil industry." Conservation of the nation's petroleum resources through advance in oil refining, the interdependence of the oil and motor industries and the achievements of research in petroleum were described in a series of papers, many of which foreshadowed the up-building of new enterprises.

Dr. Irving Langmuir of the General Electric research laboratories in Schenectady described "a new theory of adsorption and photoelectric properties" during a symposium on "adsorption," under the auspices of the Physical, Inorganic, and Colloid Divisions. Prof. H. S. Taylor of Princeton reported on "recent developments in the theory of adsorption at surfaces." A number of other papers on the subject were presented. "Chemistry and the Quest for Health" was the subject of an address by Dr. Oliver Kamm, director of research of Parke, Davis & Co., at a symposium on "the relation of chemistry to biology and medicine." Drs. E. A. Osterberg and G. J. Thompson of the Mayo Clinic, Rochester, Minn., reported on the use of a new cystographic medium to widen the use of X-rays. The results of chemical studies of epilepsy and feeble-mindedness were presented by Dr. Sidney S. Negus of the Medical College of Virginia. Prevention of abdominal adhesions after operations was discussed by Drs. Robert P. Walton, Alton Ochsner, and Earl Garside of Tulane University.

Prof. H. C. Sherman and Miss Elizabeth N. Todhunter reported on further studies at Columbia University on the measurement of Vitamin A values, while Drs. Frederick W. Heyl and E. C. Wise of Kalamazoo, Mich., reported on "colorimetric Vitamin A assay." The world's food problems were considered at a meeting of the Division of Agricultural and Food Chemistry. The Division of Chemical Education also held sessions, while painting problems in the South were discussed during a symposium by the Division of Paint and Varnish Chemistry.

The 84th meeting of the American Chemical Society was held in Denver, Colo., during August 22 to 26, at which 296 papers were read before 16 divisions. The registration showed 916 persons present. The President's address was on "Some Economic Aspects of Research." He held that research was America's greatest asset, and said that, unless it were made continuous through united governmental, educational, and corporate effort, national decay lay ahead. At this meeting the Priestley medal was presented to Dr. Charles L. Parsons and a silver tea service in recognition of his great work while secretary or manager of the Society, which has resulted in an increase of membership from less than 4000 to nearly 19,000.

In an address Dr. Oscar K. Rice of Harvard University explained the "theory of molecular gas reactions," and in doing so disclosed one of the odd, new facts about molecules of a gaslike ether. Ether and the other gases break up when heated to temperatures of several hundred degrees. Their molecules are made up of many atoms, and these little aggregations fly to pieces. They break up because the molecules "acquire excess energy." This energy comes from one molecule colliding with another, one of the two flying faster after the collision, and doing so because it has acquired some extra energy from the molecule it hit. But, some of the molecules do not break up as expected. It is as though some of the energy of the molecule were not available to cause decomposition, that it was cut off in some way from the weak spot in the molecules. Dr. Rice indicated the evidence for the existence of this strange behavior and some of its results.

Among the results presented by chemists are the following: The contributions of the chemist to Egyptology were outlined by Prof. Lyman C. Newell of Boston University. The famous blue of ancient Egypt is no longer a secret of the dead. Modern chemists have analyzed it and duplicated it. They have pried into many other of the Egyptian "lost arts," with the result that they are "lost" no longer. "In recovering and preserving antiquities, chemists have rendered indispensable service. Thus, by spraying frail or partially disintegrated objects with a solution of celluloid or similar material, the object was stiffened enough to permit handling. Similarly, by soaking wooden objects in hot paraffin, the wood was prevented from splitting or warping."

More inspiring is the fact now established by the work of Dr. H. L. Campbell, Dr. L. N. Ellis, and other investigators of the Columbia laboratories that even when we start with an average normal condition, an enrichment of our diet tends to the enhancement of "positive" or "buoyant" health, to the preservation of the characteristics of youth, and the prolongation of the prime of life. "Plainly, a substance which plays such a

part, in and through nutrition, is a very important factor in food values. Hence the problem of its quantitative measurement was carefully investigated by Dr. Anne Bourguin. Upon the basis of exact knowledge thus laid, Dr. H. K. Steibeling made experiments which indicate, as do certain results obtained in other laboratories, that this important nutritional factor now known as Vitamin G is in its chemical nature a multiple rather than a simple factor, a group of two or more chemical substances rather than a single chemical entity."

Charles Allen Thomas and William H. Carmody of Dayton, O., described a synthetic resin, the first of its kind to be made from petroleum, having a property of extreme rapid drying, which should make it useful in the varnish and paint industries. The new resin, still in the experimental stage in the plastic industry, can be combined with wood pulp to form a finished wall board. It is a good heat insulator in the board, very tough, and can be molded into card tables, steering wheels, doors, and other articles.

The housewife's trouble with lumpy sugar may soon be a thing of the past, for H. V. Moss, who is chief chemist of the Provident Chemical Works of St. Louis, reported that calcium phosphate, which had been used for many years to prevent the caking of table salt, was equally useful in sugar and also had valuable health properties. "Calcium phosphate seems especially suitable for use as a sugar conditioner because recent biochemical research has shown that it is a valuable addition to the diet. The diet of many Americans, especially those who eat large quantities of white flour and sugar, may be deficient in calcium and phosphorus, which are needed for building bones, keeping the teeth from decay, and preventing the premature appearance of old age."

Sealskin coats are not the only product obtainable from Alaskan seals, according to Dr. Gustav Egloff, chief chemist of the Universal Oil Products Company, Chicago, and his research associate, Edwin F. Nelson. "Although the quantity of seal oil available yearly is relatively small, technically the cracking process, which is providing yearly over 7,000,000,000 gallons of gasoline in the United States, can convert seal oil under high temperatures and pressures into 60 per cent of gasoline of high anti-knock value, 12 per cent of asphalt suitable for road-making, 7 per cent of oil which can operate Diesel engines, 16 per cent of gas to light or heat our homes, and 5 per cent water which may be purified for drinking."

Miss Helen L. Wikoff of Ohio State University reported that the salaries of women chemists had increased since 1922. "Only five women chemists reported salaries of \$3000 or over in a survey made by the Bureau of Vocational Information in 1922, while ninety-two in a group of 340 today have salaries in that range."

*Disease Killing Rays.* A "new force" for producing disease killing rays within the human body was announced by Dr. Ellice McDonald, director, and Dr. A. J. Allen, physicist, of the cancer research laboratories of the University of Pennsylvania. The rays are ultra-violet light. They are planted in the body like bombs, by injecting certain chemicals into the area to be rayed. The chemicals are perfectly "dark" by themselves, but transform into ultra-violet flares when X-rays are turned upon them. The chemicals are all organic—that is, made from plants or animals. When they "light

up" under X-rays their ultra-violet rays range from lengths of from 3000 down to 2000 angstrom units. This means that the rays are shorter and more powerful than any ultra-violet reaching the earth from the sun. All of them are lethal to individual body cells, said the report.

Killing power seems due to the fact that body cells are virtually armored against some of the wave lengths of the rays and unprotected against others. So killing a cell is largely a matter of selecting light rays. Over this selection the scientists have some control, because the chemical compounds forming bombs give off different lengths of ultra-violet. "This research gives great hope of finding the range of radiation destructive to the cancer cell and of increasing the powers of X-rays and radium in the treatment of cancer. The most effective range of ultra-violet light was found to be from 2900 to 2500 angstroms. Casual and inexperienced experimentation is dangerous, and may do harm. A new force has been shown, which requires a great deal of investigation as to its application in the treatment of disease. It is possible to produce such radiation in remote cavities of the body by directing the penetrating beam of X-rays upon the injected solution of organic substances." The outstanding new point of the discoveries is a method of placing these powerful rays inside the body, possibly exactly within the site of the disease. Another striking circumstance is that recently other scientists have found evidence that the body produces its own ultra-violet light, apparently all the time, a very faint type, but one seemingly associated rather intimately with health.

Dr. Lawrence V. Redman, of the Bakelite Corporation, became president on Jan. 1, 1932, for the term of one year, and was to be succeeded in 1933 by Arthur B. Lamb, professor of chemistry and director of the chemical laboratory of Harvard University. The total membership of the Society was 18,600.

**SOCIETY OF CHEMICAL INDUSTRY.** This organization held its 51st annual meeting in Nottingham, England, during July 13-15, under the presidency of Prof. Gilbert T. Morgan, who delivered a retiring address on "Ourselves and Kindred Organizations" in which he urged the importance of consolidating the "past achievements in chemical industry, in bringing together in close unity all chemists of the British Empire, and in promoting good fellowship and concord among English-speaking chemists the world over." The Messel medal was given to Sir William J. Pope, a past president, who delivered the memorial lecture on "Forty Years of Stereochemistry."

The secretary reported the membership as 4410 as against 4541 a year ago. As the number of new members elected during the year was greater than that of the year previous, this decrease was explained by the greater number of deaths and resignations among the older members. The new president, Dr. Robert H. Pickard, of Shirley Institute, Manchester, was elected at this meeting and the invitation received from Newcastle was accepted for the meeting to be held in July, 1933.

**MEDALS.** The Perkin medal of the American Chemical Society was on January 8 presented to Charles F. Burgess for his achievements in electrochemistry. The Charles Frederick Chandler medal of Columbia University was given on February 5 to James Bryant Conant for his work

in organic chemistry, following his delivery of a lecture on "Equilibria and Rates of Some Organic Reactions." The Hillebrand prize of the Washington section of the American Chemical Society was awarded on February 11 to Gustaf E. F. Lundell for the outstanding merits of his book on analytical chemistry. The William H. Nichols medal of the American Chemical Society was on March 11 awarded to James Bryant Conant for his chemical investigation that led to the establishment "of the essential nature of the chlorophyll molecule." The *Popular Science Monthly* gold medal and \$10,000 award was on March 18 presented to Irving Langmuir "for notable scientific achievement." Doctor Langmuir was the first to apply argon to tungsten electric lamps.

The Priestley medal of the American Chemical Society was on March 28 awarded to Charles L. Parsons for his important work as secretary of the American Chemical Society in building up that organization, now one of the largest chemical societies in the world, with a membership of over 19,000. The Theodore W. Richards medal of the Northeastern Section of the American Society was on May 6 awarded to Arthur A. Noyes for his "distinctive services to science." The medal of the American Institute of Chemists for noteworthy and outstanding service to the science and profession of chemistry in America was on May 7 presented to Charles H. Herty for his researches that "evolutionized the turpentine industry." The Willard Gibbs medal of the Chicago section of the American Chemical Society was presented on May 20 to Edward C. Franklin for a lifelong study of liquid ammonia solution "which opened up a new field" in organic chemistry. The Joseph F. Schoellkopf gold medal of the Western New York section of the American Chemical Society was awarded on May 17 to William H. Church for his solution of the problem of moisture-proofing cellophane and for his contributions to the chemistry of collodion.

**GALLIUMS.** The research laboratory of the Vereinigte Chemische Fabriken, the consolidated chemical works, owned by the state of Prussia, announced the discovery in May of a process of extracting gallium so revolutionary that it may reduce the selling price from 175 to 10 marks a gram. At this price, gallium, heretofore a scientific luxury, has a wide field opened to it for industrial employment, and, as the new process is protected by patent, it seems likely that Germany will have a monopoly of the commodity and an added source of export. The industrially outstanding characteristics of gallium are its low melting point, 30° C., and its very high boiling point of near 2000°. The latter singles it out to replace mercury in thermometers for measuring high temperatures, as in blast furnaces. Other uses for gallium: for optical mirrors, since it will reduce light-absorption loss; for dental fillings, in place of mercury, because it is non-poisonous; for manifold employment in electro-technics, by virtue of its combining low melting and high boiling points. The Leopoldshall works obtain the gallium as a by-product of the copper mined in Thuringia. It occurs in the molybdenoid "impurities" from which the copper must be freed. It occurs also in zincblende in the proportion of 0.001 per cent.

**POTASH.** According to an Associated Press dispatch dated April 15, exploration by the United States Geological Survey in the Great Permian

Basin in Texas and New Mexico has disclosed a supply of potash sufficient to fill the country's needs through any emergency which may arise in the future. The Permian Basin is 300 miles wide and possibly twice as long, lying principally in Texas and New Mexico, but extending north into Kansas and Colorado. One year's working by the United States Potash Company of New Mexico developed 45,000 tons of potash, or about 4 per cent of all the nation's requirements. At present American farmers require about 1,000,000 tons of potash material annually, worth \$25,000,000. Some 80 per cent of it has to be imported, mostly from Germany and Alsace in France. The expectation is that the Southwestern deposits will be sufficient to supply the United States for decades in time of need. The indications are that they are equal or superior in quality to the potash mined in Germany and Alsace.

**RUSSIAN STEELS.** The Dnepropetrovsk Institute of Metals has invented a method of smelting chromium-tungsten steel in an ordinary open-hearth furnace, according to the *Economic Review* of the Soviet Union. This steel, which is now imported, is of great importance in steel mills, especially in the manufacture of basic construction parts. It is made abroad only in electric furnaces, since the specific gravity of chromium-tungsten is considerably higher than that of iron, and requires a very high temperature. The Leningrad Institute of Metals has developed a method for the manufacture of high-grade malleable iron to replace the so-called European method. It is estimated that the adoption of the new method will save 89,000 rubles a year at the Lepshe factory alone. The Lenin Metal Works at Zlatoust, in the Urals, has begun the smelting of stainless steel for the first time in the Soviet Union. A plant is under construction for the production of high-grade steel. This will be one of the largest of its kind in the country, with an annual capacity of 50,000 tons.

**FELT-COATED STEEL.** A new laminated metal, developed by Dr. A. W. Coffman, was announced on March 20 by the Mellon Institute of Industrial Research in Pittsburgh, Pa. By the use of alloys the hitherto alien materials are made an integral part of the steel, on one or both sides. These alloys are heated to just beyond their "plastic" points, the temperature at which they become soft before turning into a true liquid. In that stage and above alloys of tin, lead, and zinc amalgamate with the linings. Exactly the right cooling is necessary for success. The coatings mostly experimented with thus far are asbestos and cellulose. Without rupture of these linings, the steel has been corrugated, cut with the ordinary tools of a tinsmith, rolled into pipe and even "drawn." A cellulose-coated piece of steel was elongated 8 per cent by cold rolling. This felt coating of metal opens new commercial possibilities. It means that for many practical uses steel can be covered with all sorts of protective or attractive finishes, even to the imitation of a silken surface.

**POWDERED METALS.** According to a report by Dr. Paul D. Merica of the International Nickel Company, presented in February before the 141st meeting of the American Institute of Mining and Metallurgical Engineers, it is now possible to harden virtually any metal or alloy, so that the soft and weak metals such as copper, lead, zinc, nickel, aluminum, and tin can be made as strong as steel. Many metals and alloys hitherto me-

chanically inferior to steel may be brought up to the standard of steel as far as mechanical properties are concerned, through the development, within the past decade, of a process known as age-hardening. Until recently steel has been practically the only metal which could be hardened and strengthened by heat treatment. Now all the common metals may be alloyed in such a manner by age-hardening. Copper-nickel alloys may be heat-treated to exhibit tensile strength in the neighborhood of 175,000 pounds to the square inch, comparable with the strength of heat-treated steel. After certain heat treatment, these alloys harden as they grow older. Sometimes they age-harden at room temperature, sometimes they must be aged at higher temperatures. A single day is often enough to bring about the desired changes in mechanical properties, although slight changes may continue for a month.

**ALLOYS.** The discovery of a new alloy consisting of wire and aluminum that will not rust when hot, was announced February 17. Experiments made with the X-ray in the Pennsylvania State College solved the secret of what happens when one metal dissolves in another, vanishing as completely as sugar in water. The disappearance of one in the other is due to a chemical combination between atoms of the disappearing metal and the surrounding atoms of the solvent metal. This knowledge, that the atoms follow the laws of chemical combinations regardless of the proportions of the mixture, indicates a starting point for new advances in alloy-making. "The new evidence correlates many facts which have hitherto lacked simple fundamental explanation. It shows why the electrical conductivity of copper wire is so greatly reduced by small amounts of impurity in the copper, it explains why it is possible to break up certain alloys by electrolysis, and it ties in directly with the already accepted picture of the nature of ordinary solutions, such as sugar in water."

Another improvement of alloys was similarly announced on February 10. It was found that by growing a metallic skin on some alloys and giving other gas baths, a fortune could be saved to American industry. The research was made upon brass, the industry in which non-ferrous metals are most extensively used in producing alloys. Most of the furnaces used gas and alloys shrink during the melting; this is due largely to metal which boils away into the air. The losses are high because the brasses are 5 to 10 times as costly as iron alloys, and also boil more readily. The skins which reduce losses are oxygen crusts, formed upon the liquid metallic surface. They blanket the volatile elements in the molten mass so as to retard escape. They are especially efficient in saving shrinkage of zinc alloys. But these skins are of little use for lead and tin. Here the gas bath is best. It is obtained by melting the alloys in an atmosphere in which some other gas is substituted for oxygen. Nitrogen is one of the most effective. But the kind of gas bath needed depends largely upon the kind of alloy in the furnace.

**RUBBER.** The new source of rubber (see *YEAR BOOK* for 1930, p. 155) described as being inaugurated by the Soviet government in Russia finds confirmation in a report from Moscow published early in January, which says: "Russia claims to have solved her rubber problem, and within ten years that country expects to be one of the great rubber producers of the world." It

was found that the rubber comes from the root of a plant called the "towsagyz," meaning "mountain chew." The plant grows on sunny slopes 4000 to 5000 feet above sea level, with a bristle of spiky green leaves eight to ten inches high and a tap root weighing from two to four pounds at maturity, which requires five years or more. Samples sent to Tashkent and Moscow showed that the root contained 40 per cent latex, which gave 95 per cent pure rubber, extractable by a simpler and cheaper process than that used for the latex from the Brazilian and Malaysian rubber trees. A process was worked out that mashes the root and washes away the cellulose, leaving the rubber behind, and a bacteriological process whereby the cellulose could be dissolved in nine to ten days was discovered. According to the *Industrial Gazette*, 250,000 acres were planted to "towsagyz" and the Tashkent factory, completed this year, has a daily output of 60 tons of pure rubber.

A report from Salinas, Calif., says that the American Rubber Producers' plant began operation on February 5. It is said that it was the first time rubber had been produced in commercial quantities in the United States. The plant utilized is a perennial herb known as guayule, from which pure rubber is extracted, and then turned out in 200-pound blocks. Six thousand acres of Salinas Valley are devoted to the culture of guayule. One hundred acres were harvested during 1932.

**NEW KINDS OF SUGAR.** The discovery of sugars that crystallize as one substance, although they undoubtedly are mixtures of two components, was reported on Dec. 28, 1931, to the American Chemical Society by Dr. Claude S. Hudson of the United States Public Health Service. Two of them were obtained by bringing about a combination between galactose, one of the two substances which make up milk sugar, and hydrocyanic acid. The other was produced in the same way from mannose, a sugar obtained from palms. The properties of "galaheptose" and "mannoheptose," as the two new sugars are called, are being studied to determine their physiological effects. Both galactose and mannose consist of molecules made up of six carbon atoms, differently arranged. The three new sugars have seven carbon atoms each, picking up one from the hydrocyanic acid. The essential difference between them is the arrangement of the atoms in the molecule. They are not combinations of known sugars, but entirely new substances which, so far as is known, do not occur in nature.

**NEW SOURCE OF RAYON.** It was announced in April that sugar-cane waste had been turned by the United States Department of Agriculture into a new source of rayon. The method, known as the nitric acid pulping process, consists of soaking the raw material in a weak nitric acid solution for several hours at a medium temperature, then heating it for an hour and finally washing and boiling in dilute sodium hydroxide to produce a soft, bleachable pulp. The process increases the potential value of bagasse and at the same time offers a new and steady source of raw material for the rayon industry. This discovery is regarded as important, as most rayon manufacturers depend upon wood pulp for cellulose and the American forests and wood supplies are gradually diminishing. The department regards the process as now developed to a point

where commercial interests can work out the practical problems of manufacture.

**BETTER PAPER PULP.** On September 6, Dr. Charles H. Herty announced his discovery of a possible means of eliminating sap stain, known as blue stain, from pine-paper pulp. He finds that by using pine log immediately after the tree is cut a pulp is obtained that is "remarkably white and practically as white as the finished product of the paper pulp mills." The method substantially diminishes the process of bleaching. The discovery was made by putting the green log through the pulping process before the sap stain, produced by a fungus, had time to become attached to the log. The cost of seasoning will be eliminated, if the timber owner delivers his logs to the paper pulp mill on the same day that the trees are cut. The elimination of the sap stain has been a costly problem, for it has been prevented only by the highly expensive process of kiln or other drying.

**CLOTH FROM GRASS.** Ramie, known also as china grass, has been used from time immemorial for the making of cloth, but the process of obtaining large quantities of the finished product by removing the gums and other impurities has been laborious and very costly. The method of chemically treating the nettle, with a sulphuric acid mixture, has cost many millions of dollars. A secret process, without the use of sulphuric acid, has now been perfected. It successfully removes the gum and other impurities, and results in fibre and yarn able to meet every test by chemical experts. A new product is obtained that is as high in alpha cellulose—used in making rayon, and nitro cellulose products—as is cotton. An admixture of ramie to rayon makes a product that does not rot or break, and it provides a strong and more durable garment. Experiments have shown that the newly processed ramie, substituted for cotton in the making of asbestos brake linings, will withstand more heat and will deteriorate much less rapidly than linings made of cotton and asbestos.

**NEW PROCESS FOR MAKING ARTIFICIAL DIAMONDS.** A process announced in April for making artificial diamonds was devised by L. H. Barnett, of the Columbia School of Mines. Iron containing carbon, silicon, and phosphorus was used. The carbon supplied the material for generating the pressure and producing the diamonds, the silicon to force precipitation of the dissolved and combined carbon and produce graphite, and the phosphorus to prolong the period of fluidity of the iron during cooling. The iron was melted in very high temperature and, when thoroughly molten, poured into large steel shells and then allowed to cool very slowly. During the cooling the forced precipitation of the graphite from the dissolved and combined carbon increases the original volume and, due to the resistance of the steel shell, produces internal pressure which, acting upon the graphite, converts part of it into diamonds. When the iron is thoroughly cooled it is serially dissolved in various acids for the complete removal of the iron, graphite, and all other impurities and free diamonds are the final residue. The diamonds were small, not even large enough for diamond drill, but, nevertheless, they are larger than ever before produced artificially.

**COLORING MATTER OF BACTERIA.** In April the announcement was made that a chemical constituent of the universal coloring matter of bac-

teria had been identified by Dr. Calvin B. Coulter in the College of Physicians and Surgeons of Columbia University. This substance was first seen by an English physician in 1886, but has been little studied until recent years, when the researches of Dr. Hans Fischer, who received the Nobel prize in chemistry for 1930, for his work on the porphyrins, have made it possible to pursue the subject. In animals, porphyrin is combined with iron to make hemoglobin, while in the chlorophyll of plants the porphyrin is combined with magnesium. The ingredient belongs to the group of porphyrins, which are the building elements of hemoglobin and of chlorophyll, the green coloring matter of plants. Dr. Coulter, who has been studying this subject for the last three years, explained that the universal pigment of bacteria is cytochrome, which has been found in all living cells, plant and animal alike, that consume oxygen. In the diphtheria bacillus, which he has used in his studies, Dr. Coulter finds that the porphyrin is combined apparently with copper and iron. A surprising discovery, it was said in a report to the Chemical Foundation, is that the amount of this copper-iron porphyrin compound, which is set free during the development of diphtheria bacillus culture, is proportional to the amount of poisonous substance of diphtheria toxin formed. What toxin is chemically is not known. These observations offer a new method of investigating the toxin, and may make it possible to estimate its amount without the use of animal inoculation. The spectroscope is used in the investigation of porphyrins, and the methods in general are those of the physicist rather than of the bacteriologist.

**DEATH FOG MENACE.** This unfortunate condition was sensationally made known to the world in December, 1930, when 60 persons choked to death in a strange yellow fog which spread over the countryside in the Meuse Valley in Belgium. This poison fog, it has been ascertained by S. W. Griffin and W. W. Skinner of the Bureau of Chemistry and Soils of the Department of Agriculture, was due to the sulphur dioxide from factory chimneys, and probably no industrial centre is entirely free from such a menace if meteorological conditions are right. These scientists have invented an apparatus by which sulphur dioxide in the atmosphere is absorbed in an iodine solution. From the amount of iodine used up the chemists are able to calculate the percentage of sulphur in the air. Thus a community can be warned as soon as this reaches dangerous proportions. In the United States a number of important smoke surveys are in progress. The city dweller has come to understand that smoke contains invisible, acid-forming constituents which may be of vast importance as property destroyers. Rural and suburban communities have suffered to moderate degrees from the drift from nearby cities of the dense coal smoke, and from the sulphur dioxide and sulphur trioxide released into the air in the combustion of sulphur-containing fuel. A second discovery reported by the American Chemical Society is by Dr. Robert D. Snow of the University of Illinois. His method involves taking sulphur out of coal at the mines. The coal first is ground and then treated with an acid solution. It is believed that part of the sulphur can be recovered for commercial use. Some coals contain from 2 to 5½ per cent. As much as 93 per cent of the

sulphur originally in the coal can be removed by this process. Even in very dilute quantities, according to the American Chemical Society report, sulphur dioxide in the air will corrode steel and other metal objects, and is destructive of marble, brick and mortar. Paint and other protective coatings are now the chief means of preserving structures attacked by the gas. It must be present in considerably more concentrated quantities before it becomes dangerous to plant and animal life.

**RECENTLY DISCOVERED ALKALOIDS.** The announcement was made in September of some new alkaloids found in crude kerosene by Dr. J. R. Bailey, of the University of Texas. These products, different from anything hitherto obtained from a natural source, are classified as hydro-aromatic bases, in which are included such well known plant-drugs as quinine, morphine, cocaine, and strychnine. An unusual feature is that these substances, derived from petroleum, represent new types of compounds, previously unknown to the chemist. Hitherto the plant kingdom alone has furnished alkaloids. Interesting also is the fact that these new alkaloids do not exist already formed in petroleum, but result from the breaking down of more complex molecules in the refining process of crude oil. All of them contain a single nitrogen atom united with numerous carbon and hydrogen atoms to form molecules of the general shape that chemists call "rings" or "cyclic molecules." They differ from the plant alkaloids in that they contain no atoms of oxygen. No one can foretell how far these slight differences may go toward producing important effects upon disease. But it would be a strange event in chemical history were there not encountered in this vast domain of organic nitrogen compounds one or more substances of exceptional medicinal value. These petroleum alkaloids will be studied in the Cancer Research Institute of the University of Pennsylvania. The head of the institute, Dr. Ellice McDonald, makes a statement that "these new substances are a great and promising field in medicine and biological research."

**NEO-NICOTINE OR ANABASINE.** Some years ago C. R. Smith, of the Insecticide Division of the Bureau of Chemistry and Soils of the Department of Agriculture undertook to produce in the laboratory something similar to the nicotine obtained from the tobacco leaf, to be used as a fruit tree spray or insecticide. He succeeded in making a synthetic product which he named neo-nicotine, but it was expensive. Within a year the Soviet government endeavored to find a use for a weed growing profusely over Southern Russia, known botanically as *Anabasis aphylla*, which was regarded as a nuisance. Two chemists turned their attention to this particular growth and found that it contained a new alkaloid. Alkaloids are poisonous, as they found this one particularly, and named it anabasin and described its chemical structure in a technical journal. The discovery revealed to the Soviet government that it had a potential source of wealth in what had been regarded as a useless weed. When the article reached the United States, Smith's attention was called to it and he found it was described as identical with the material he had made in the Washington laboratory. The Department of Agriculture promptly secured from abroad seeds of the plant and grew specimens at their experimental farm. Physiological tests thus far reported in-

dicates that neither the laboratory product nor the Russian plant product is quite as powerful a poison for warm-blooded animals as the nicotine from tobacco, but approach it closely. This experience constitutes one of the most curious chapters in the recent history of chemistry, as it is a reversal of the ordinary order. Usually a substance is first found in nature. Then chemists, after long study, are sometimes able to manufacture it synthetically. But neo-nicotine or anabasine was found first in the laboratory.

**CHERET**, shā'rā', JULES. A French lithographer and mural painter, died in Nice Sept. 23, 1932. Born in Paris in May, 1836, he served his apprenticeship as a lithographer with the *pension* *Leroy*. He was the first to convert poster designing into a real art, his work being original and charming, his drawing skillful, and his color pleasing and harmonious. Among his best posters are "Bal de Valentino," "Le Petit Faust," "Pan," "Searamouche," "Loie Fuller," "Vin Mariani," and "Jardin de Paris." As a mural painter he showed extraordinary talent in such decorations as the dance scenes, entitled "Les Joies de la Vie," in the Hotel de Ville, Paris, in which the grace of the rococo is combined with modern French elegance. Other murals which he painted are found in the Palace of the Prefecture in Nice and in numerous hotels and residences. He designed also cartons from which were developed some of the Gobelin tapestries. He received a gold medal and a medal of honor at the Paris International Exposition of 1900 and was made a grand officer of the Legion of Honor, a commander of the Order of the Crown of Italy, and a commander of the Order of Alfonso XII of Spain.

**CHESHIRE**, THE RT. REV. JOSEPH BLOUNT. An American Protestant Episcopal clergyman, died in Charlotte, N. C., Dec. 27, 1932. He was born in Tarboro, N. C., Mar. 27, 1850, and was graduated from Trinity College (Hartford, Conn.) in 1869. After teaching school for two years he studied law and was admitted to the bar in 1872. He practiced for several years in Baltimore and Tarboro and then turned to the church, being ordained a deacon in 1878 and a priest in 1880. The first three years of his ministry were spent at Chapel Hill, N. C. He then served as rector of St. Peter's Church, Charlotte, N. C., until 1893 when he was chosen Bishop Coadjutor of the Diocese of North Carolina. He succeeded to the Bishopric on the death of Bishop Lyman the same year. As historiographer of his diocese, he edited *Sketches of Church History in North Carolina* (1892) and wrote *The Early Conventions of the Episcopal Church in North Carolina* (1882) and *History of the Protestant Episcopal Church in the Confederate States* (1911).

**CHESS**. Although, because of financial difficulties, another year passed without a return match for the world's chess championship between Dr. Alexander Alekhine and Jose Capablanca, whom Alekhine dethroned at Buenos Aires in 1927, there was no lack of activity in chess ranks in 1932. Alekhine himself was among the busiest of players, competing in four major tournaments and giving innumerable exhibitions of his uncanny skill at the boards. The Russian, who now makes his home in Paris, won at London, Berne, and Pasadena, and shared honors with Isaac I. Kashdan, youthful New York expert, at the Mexico City tournament. Kashdan during the year was second to Salo Flohr, of

Prague, at Hastings, England, and ahead of Dr. Max Euwe, master from Amsterdam. Kashdan also finished second to Alekhine at Pasadena. He was excelled by Flohr at London and divided third and fourth prizes with Mir Sultan Khan of India.

Alekhine made an extensive exhibition tour, studded by a performance at New York City in early November when he played 200 players simultaneously in 50 games. He won 30, lost 6, and drew 14 games, bettering slightly the achievement of Capablanca at the same boards two years before. Earlier in the year Alekhine was pitted against 300 players at Paris, and Capablanca played 330. G. Koltanowski played 160 games simultaneously at Antwerp, and later showed his skill by placing ahead of Flohr to win the masters' tournament at Antwerp. In set matches in Europe, Rudolph Spielmann of Austria defeated E. D. Boguljubow, of Germany, 5½ to 4½, and Euwe and Flohr tied, 3-3, with 10 drawn games.

Reuben Fine, Marshall Chess Club champion, won the Western Chess Association tournament at Minneapolis, displacing Samuel Reshevsky, of Chicago, a close second. Nathan Grossman of Brooklyn took the New York State title. The Marshall Chess Club, winning 11 consecutive matches, won the Metropolitan Chess League title by a slim margin over the Manhattan Chess Club. The Bell Telephone Laboratories team defeated the Brooklyn Edison team in the Commercial Chess League competition. City College of New York easily outranked Columbia. Brown, New York University, Pittsburgh, Brooklyn, and Pennsylvania in the Intercollegiate Chess League tournament, and Princeton was an easy victor in the H.Y.P.D. College Chess League, with Harvard second, Dartmouth third, and Yale fourth.

**CHESTER**, REAR ADMIRAL COLBY MITCHELL, U. S. N., RET. An American naval officer, died in Rye, N. Y., May 4, 1932. He was born in New London, Conn., Feb. 29, 1844, and was graduated from the U. S. Naval Academy in 1863. Appointed ensign, he served during the Civil War with the West Gulf blockading squadron and participated in the operations against Mobile. After holding several important commands he was made commandant at Annapolis in 1891, commander of the New York navy yard in 1894, and commander-in-chief of the South Atlantic squadron in 1897. During the Spanish-American War he commanded the *Cincinnati*, the flagship of the North Atlantic squadron. In 1902 he became superintendent of the Naval Observatory, where he remained until his retirement in 1906. He was made a rear admiral in 1903. On the entry of the United States into the World War he became professor of naval science at Yale University, and was superintendent of the naval units of Yale and Brown Universities until April, 1919. He was engaged for 15 years, under appointment from President Roosevelt, in establishing the open door for American trade in western Asia. He was president of the Inter-Ocean Engineering Company and negotiated concessions for the construction of railroads and the development of mines and oil wells in the Ottoman empire. These concessions were later cancelled by the Turkish government.

**CHICAGO**. See ILLINOIS under *Political and other Events*; MUNICIPAL GOVERNMENT.

**CHICAGO**, THE UNIVERSITY OF. An institution of higher education and research in Chicago,

Ill., founded in 1890. The university is privately endowed, coeducational, and non-sectarian, although one-third of its 30 trustees must be Baptists. John D. Rockefeller founded the university, and his personal gifts amounted to a total of \$35,000,000 over a period of 20 years.

The educational reorganization of the university, which became effective in October, 1931 (see the *NEW INTERNATIONAL YEAR BOOKS* for 1930 and 1931, for details) met with a degree of success even greater than was expected. Although the plan was announced as an experiment, few revisions were deemed necessary for the second year of its operation. New syllabi, developed on the basis of week-to-week studies made by the faculty in 1931, have been published, as well as syllabi for 32 subject sequence courses from which the new plan students may choose their more specialized studies in the college. In the comprehensive examinations given in the four divisional fields in June, 1932, the proportion of failures ranged from 8 to 12 per cent. Only 5 per cent of the freshman class were denied the privilege of returning for further study. A significant number of students took advantage of the opportunities offered by the new plan to complete the work of a year in less time.

Appointments to the faculty included those of Dr. George F. Dick, as chairman of the department of medicine in the division of the biological sciences; Dr. Henry S. Houghton, as associate dean of the division of the biological sciences and director of the university clinics; Louis R. Wilson, as dean of the graduate library school and professor of library science. Dr. Otto Struve succeeded Dr. Edwin B. Frost, retired, as director of the Yerkes Observatory, Williams Bay, Wis., and Thomas N. Metcalf was appointed director of athletics, to succeed Amos Alonzo Stagg, who reached the retiring age.

Under an agreement made with the University of Texas, the latter institution is to build and equip a new astronomical laboratory in the Southwest, and the University of Chicago is to provide the staff. This cooperative agreement will save duplication of equipment, and permit a much better equipped observatory than would have been possible had the two institutions divided their funds for separate observatories and staffs. During the year the university undertook, in cooperation with Erpi Picture Consultants, Inc., the production of a series of 20 talking motion pictures for use in the college general courses and for general distribution. Several of the films were completed.

During the summer quarter of 1932, 4475 students were enrolled; during the autumn quarter of 1932, the enrollment was 7301. The total enrollment for 1931-32 was 12,395. These figures do not include the enrollment in the home study or correspondence department, which has an average of 7000 students at any one time. The members of the several faculties, exclusive of assistants, numbered 812 (including 101 in the university college) on Nov. 1, 1932. In all departments and in all grades of service, the university employed approximately 3000 persons.

The assets of the university as of June 30, 1932, were \$110,737,788, an increase of \$1,958,328 over the figure for the same date in 1931. These assets were divided as follows: endowment, \$61,503,775; plant, \$38,300,429; current assets, \$2,786,156; other assets, \$8,147,426. The total income under the university's combined budget for

the fiscal year 1931-32 was \$7,736,077, while expenditures amounted to \$7,719,733. Student fees provided 31 per cent of the university budget income, and endowment funds 39 per cent. The salary cost of instruction and research constituted 40 per cent of the budget expenditures, or \$2,085,278. The amount of gifts paid in was \$4,063,647.

The new International House at Chicago, representing an investment of more than \$3,000,000, and the gift of John D. Rockefeller, Jr., was completed and dedicated in October. Although located on the university campus, International House at Chicago is governed by an independent board of directors. It is the centre for the foreign students of the Chicago area.

A carillon of 72 bells was installed in the tower of the university chapel and dedicated on Thanksgiving Day. The carillon is also the gift of Mr. Rockefeller, and is a memorial to his mother, Laura Spelman Rockefeller.

The University of Chicago Press published 125 books during 1932, in addition to 16 scholarly journals and a large number of publications for such groups as the National Advisory Council on Radio in Education. The most important single publication was the three-volume study of the Edith Rockefeller McCormick New Testament manuscript, one volume of which was a facsimile reproduction. The Press undertook also distribution of the educational talking pictures. Accessions to the university libraries increased the number of bound volumes to 1,013,532, and the number of periodicals regularly received to 5322. President, Robert Maynard Hutchins, LL.D.

**CHILD LABOR.** The U. S. Bureau of the Census, in presenting statistics of children gainfully employed for the census year 1930, indicated that there were 667,118 child workers between the ages of 10 and 15 inclusive, or 1 in every 21 of the children of these ages in the country. The number of child workers between the ages of 10 and 13 years inclusive was 235,328, or 1 in every 42 children of these ages in the country. The number of child workers 14 and 15 years old was 431,790, or 1 in every 11 children of these two years in the country. Extending the range of children gainfully employed, it is ascertained that the number of children between the ages of 10 and 17 years inclusive was 2,142,973. This was a marked decrease for these age groups over the 1920 census. The decrease for boys was from 22.2 per cent to 14.9 per cent of all the males of these ages in the group and from 11.8 per cent to 7.7 per cent for the girls. Undoubtedly the decrease in the decade marked the continuance of the decline in the employment of children, a tendency already noted in 1920. In other words, public opinion is meeting with increasing success in its demand for

elimination of child labor. But it cannot be denied that the effects of the depression, through the elimination of jobs, also was an influence. Undoubtedly employers with positions available were increasingly favoring adults over children. The National Child Labor Committee, in commenting on conditions revealed by the 1930 census figures, pointed out that "... although the number of work permits issued has fallen off sharply in practically every part of the country, about as many children as ever—possibly more—are entering the occupations left unregulated by the Child Labor law, and, in fact, any occupation in which evasion or defiance of the law may be practiced by unscrupulous employers with a fair chance of impunity." The accompanying table indicates the distribution of children gainfully employed, by sex and age, for the country, comparing 1930 with 1920:

CHILDREN GAINFULLY OCCUPIED, BY SEX AND AGE, IN THE UNITED STATES: 1930 AND 1920

MALE				
Age	Total number	Gainfully occupied Number	Per cent	Per cent distribution of gainfully occupied
1930				
10 to 17 years	9,562,495	1,425,236	14.9	100.0
10 to 13 years ..	4,862,291	162,260	3.3	11.4
14 years ....	1,206,486	110,839	9.2	7.8
15 years ..	1,154,648	187,643	16.3	13.2
16 years .....	1,181,920	386,511	32.7	27.1
17 years ..	1,157,150	577,983	49.9	40.6
1920				
10 to 17 years	8,197,852	1,817,704	22.2	100.0
10 to 13 years ..	4,336,009	259,259	6.0	14.2
14 years ..	1,033,297	174,683	16.9	9.6
15 years .....	925,679	281,806	30.4	15.5
16 years .....	976,834	501,134	51.3	27.6
17 years .....	926,033	602,322	65.0	33.1
FEMALE				
Age	Total number	Gainfully occupied Number	Per cent	Per cent distribution of gainfully occupied
1930				
10 to 17 years	9,401,218	720,723	7.7	100.0
10 to 13 years ..	4,760,201	73,068	1.5	10.1
14 years .....	1,175,899	46,821	4.0	6.5
15 years .....	1,141,051	86,487	7.6	12.0
16 years .....	1,185,395	201,306	17.0	27.9

1920				
10 to 17 years	8,132,861	955,802	11.8	100.0
10 to 13 years ..	4,258,863	119,804	2.8	12.5
14 years ..	1,012,968	82,911	8.2	8.7
15 years .....	935,766	143,895	15.4	15.1
16 years .....	996,124	277,823	27.9	29.1
17 years .....	929,140	331,369	35.7	34.7

It is interesting to note the number of children between the ages of 10 and 15 gainfully employed by geographic divisions and particular States. In 1930, for males in the New England States, 2.4 per cent of all the children in the age group were gainfully employed; in the Middle Atlantic States, 2.0 per cent; in the East North Central States, 2.1 per cent; in the West North Central States, 4.1 per cent; in the South Atlantic States, 12.9 per cent; in the East South Central States, 18.2 per cent; in the West South Central States, 10.9 per cent; in the Mountain States, 4.0 per cent, and in the Pacific States, 2.2 per cent. The proportions of female children be-

tween the ages of 10 and 15 years gainfully employed in 1930 in the various geographic divisions were as follows: in the New England States, 2.0 per cent; in the Middle Atlantic States, 1.8 per cent; in the East North Central States, 0.6 per cent; in the West North Central States, 0.9 per cent; in the South Atlantic States, 5.9 per cent; in the East South Central States, 8.7 per cent; in the West South Central States, 4.6 per cent; in the Mountain States, 1.1 per cent, and in the Pacific States, 0.5 per cent. The States in which relatively high proportions of children 10 to 15 years old were gainfully employed were as follows: for males, South Carolina (23.0 per cent), North Carolina (15.1 per cent), Georgia (20.6 per cent), Florida (10.2 per cent), Tennessee (12.2 per cent), Alabama (22.6 per cent), Mississippi (30.7 per cent), Arkansas (17.1 per cent), Louisiana (13.5 per cent), Texas (10.1 per cent); for females, South Carolina (13.6 per cent), Alabama (12.3 per cent), Mississippi (18.8 per cent).

A distribution by occupations shows that for the age group 10 to 15 years inclusive, 70.4 per cent of all the children employed were engaged in agricultural activities, 10.2 per cent in manufacturing, 7.4 per cent in trade, 7.0 per cent in domestic and personal service, 2.5 per cent in clerical occupations, 1.3 per cent in transportation, 0.2 per cent in mining, and 1.0 per cent in other activities. A total of 68,266 boys and girls in the age group in question were working in factories and other manufacturing plants and shops. The distribution of this group by particular types of activities was as follows: 20,625 were laborers and semi-skilled operatives in textile plants, 8650 were in the clothing industries, 7380 were in the building trades, 4790 were in lumber and furniture mills and factories, 4324 were in food and allied industries, 3236 worked in iron and steel plants. If the number of children engaged in agriculture is eliminated, then we find that the proportion of children in the age group engaged in other activities is not to a large degree localized in the Southern States. Thus, while in South Carolina, 3.2 per cent of all the children in the age group were gainfully employed outside of agriculture and in Georgia 2.9 per cent, Maryland 2.7 per cent, Florida 2.5 per cent, Louisiana 2.1 per cent, and North Carolina 1.9 per cent, in the northern State of Rhode Island the proportion was 2.9 per cent and in Connecticut 2.8 per cent, New Jersey 2.2 per cent, Massachusetts 1.9 per cent, and Pennsylvania 1.8 per cent. For the age groups 16 and 17 years there is a decidedly different distribution by occupations. In agriculture but 34.2 per cent of all the boys and girls of these two years were gainfully employed; in manufacturing and mechanical industries the proportion was 26.9 per cent; in domestic and personal service it was 11.0 per cent; in clerical occupations it was 10.5 per cent; in trade it was 9.4 per cent; in transportation it was 4.5 per cent; in mining it was 1.2 per cent; and in other occupations it was 2.2 per cent. Of the 397,985 child workers of 16 and 17 engaged in manufacturing, 82,617 worked in textile mills and factories; 48,599 worked in the building trades; 36,550 worked in clothing industries; 35,016 worked in iron and steel plants; 22,164 worked in lumber and furniture mills and factories; 25,121 worked in food and allied industries; 14,453 worked in shoe factories; 9379 worked in the chemical industries;

8619 worked in clay, glass and stone industries.

The National Child Labor Committee in further comments on the status of the child in industry, as revealed by the 1930 census and the depression, said:

Even before the depression there was a marked decline all over the country in the number of worthwhile jobs offered juniors, and a decided tendency for children's work to be confined to routine, repetitive jobs, requiring little education and involving no skill or responsibility—blind-alley jobs, lacking in opportunities for advancement. Apprenticeship positions and the more worthwhile jobs went to older children with high school or trade school training. . . . With the competition of children in the labor market aggravating the unemployment situation, with a rapidly decreasing number of jobs open to children and such jobs as exist of a type that offers nothing for their future, and with delinquency running rampant among idlers and vocational misfits, the schools must face and accept the responsibility of holding in school boys and girls for whom there is no rightful place in industry, and providing for them an education fitted to their individual capacities, interests, and ambitions.

LEGISLATION. While only nine State legislatures were in session during the year progress was made in the raising of standards of children employed gainfully. Louisiana was responsible for the passage of three constructive child labor bills. One of these set up a sixth-grade requirement for children between the ages of 14 and 16 leaving school for work in the City of New Orleans, and also provided for temporary work permits for children with physical defects, and for the appointment of a safety engineer and a vocational counselor by the city. By the second law the children of New Orleans were required to attend school until the age of 16 regardless of school grade, unless they were over 14 and legally employed. By the third law cities were empowered to establish compulsory continuation schools for children of work permit age and having jobs. Massachusetts required contractors to report the names and addresses of all children engaged in tenement home work as well as the names and ages of all minor children in homes where such work was regularly going on. New Jersey prohibited the employment of minors between 16 and 18 years in occupations deemed by the State commissioner of labor to be a menace to their safety or health. As an indication of the nature of progressive legislation being regularly presented before the State legislatures, one may here note the character of important bills which failed of passage during the 1932 sessions. In Massachusetts and New York bills calling for the raising of the minimum age of children leaving school for work from 14 to 15 or 16 years failed. In the Kentucky, Louisiana, Massachusetts and Rhode Island legislatures there failed also bills to reduce the working hours of women and girls over 16. The New Jersey, New York, and Rhode Island legislatures refused to ratify the Federal Child Labor Amendment. There failed of passage in the Massachusetts, Louisiana, and Virginia legislatures measures awarding minors illegally employed, and injured while at work, double compensation. In South Carolina a bill prohibiting night work for women and minors under 18 in textile mills, which had been introduced in 1931, was withdrawn and there were also defeated in both houses of the legislature bills to set up a workmen's compensation system in the State.

Thirty representatives of State labor departments and national organizations, at a conference called by the Federal Children's Bureau, in

December, decided to declare war against the employment of children under 16, especially during periods of industrial depression. Members of the conference pledged themselves to work actively with the 41 State legislatures to be convened in 1933 for the following basic programme: An age minimum of 16 years for children; a proportionately shorter work day for young workers than for adults; and double compensation for injuries to illegally employed minors. The conference agreed that it was imperative that more uniform child labor laws and greater coöperation among State authorities be created to prevent the escape of sweated industries from one State to another. According to Courtenay Dinwiddie, general secretary of the National Child Labor Committee, sweat shop conditions in which children were being exploited were being reported in Connecticut, Massachusetts, Pennsylvania, and New Jersey. Children often illegally employed were working for as much as 51 hours a week at wages ranging from \$1 to \$3 a week.

WHITE HOUSE CONFERENCE REPORT ON CHILD LABOR. The White House Conference on Child Health and Protection, organized in 1930 to consider every aspect of questions relating to child health, published a report of its sub-committee on child labor in 1932. The report was divided into four parts: (1) Employment of children in non-agricultural occupations; (2) Employment of children in agriculture; (3) Employment of children in hazardous occupations; (4) Administrative problems with reference to laws affecting employment of minors. The United States Children's Bureau, in analyzing the report, pointed out that

a study of this report brings home to the reader a realization that child labor means different things, at different times in different places and that, although the United States has no child-labor problems of the kind that are common in China and India to day, or that characterized the early stages of development of the textile industry in New England, nevertheless, large numbers of children are still engaged in taxing, disagreeable and even dangerous occupations, or while still immature are assuming burdens of industrial life which exclude them from the activities of play and education essential if they are to reach maturity with physical vigor unimpaired and with the mental training and social equipment necessary for good citizenship.

In discussing employment in non-agricultural occupations the report indicated that while the number of children in industry was relatively small, nevertheless they were being employed by hundreds and thousands in a great variety of non-agricultural pursuits. Apparently these activities had these factors in common: they were unskilled, mechanical and monotonous, and offered the children little opportunity to acquire either experience or skill likely to be of aid to them as adult workers. While the majority of regularly employed children under 16 were to be found as a rule in the 14 and 15 year groups, particular kinds of work, such as employment in canneries, home work, and newspaper selling, engaged large numbers of very young children. Weekly wages for children under 16 in any kind of work almost invariably averaged under \$15 and generally under \$10. The recommendations of the committee stressed the importance of not merely legislative restrictions and safeguards but also utility of general economic, social, and educational devices. The committee called for serious attention on the part of the public to the problems of adult unemployment, farm eco-

nomics, and the establishment of a living wage, saying about the last that "an income earned by the chief wage earner of the family sufficient to maintain a decent standard of living is basic to a normal solution of the problem of child labor as it is to other problems of child welfare." The committee, impressed by the fact that children of limited mental ability leave school for employment as quickly as the law allows, advocated as a child labor measure the creation of an educational programme to provide for such minors general means of real development for them. As for legal regulation, the committee called for the establishment of the following standards: that no child under 16 should be permitted to leave school for work; that school attendance be required for children up to 16 years of age; that higher age minima should be set for occupations physically or morally hazardous; that no minor under 18 years should work more than 8 hours a day or 44 hours a week or at night; that all children under 18 should be required to obtain employment certificates testifying to their physical fitness. Further recommendations included the establishment of a minimum age of 16 years for newspaper selling, the prohibition of industrial home work, and the application of the provisions of the child labor laws to canneries, work outside of school hours, and work in theatrical exhibitions and moving pictures.

The section of the report relating to the employment of children in agriculture stressed the fact that here was to be found the most serious child labor problem in the country at the present time. On the basis of 1930 census figures 61 per cent of the total number of working children 10 to 16 years old were engaged in agriculture. Too, agriculture employed thousands of children as migratory workers and presented difficult problems of control, particularly as relating to school attendance. The recommendations of this section of the report called for the creation of educational opportunities for rural children equivalent to those afforded city children. It demanded also that the age and attendance standards for schooling should be the same for both groups, and that districts should be responsible for the schooling of migratory children. For children hired out for work under some form of family wage or contract system, the safeguards recommended included the minimum wage of 16 for agricultural work for school hours and of 14 outside of school hours. The proposals also called for the creation of a system of work permits for children in agriculture under 16 who were not working on a home farm, and recommended the regulation of sanitary conditions of labor camps for migratory workers under the State department.

The section on hazardous occupations, industrial accident, and workmen's compensation to minors drew a distinction between industrial accidents suffered by adult and minor workers. The report pointed out that while the adult worker might be expected to assume some risk, society was not in the position to tolerate any such reservation in the case of minor workers. The report stressed the fact that young workers were particularly liable to accident to a large extent growing out of their natural curiosity, irresponsibility, and carelessness, and that they were peculiarly susceptible to injuries from poisons and vitiated air. The recommendations stressed in this section of the report that the

State make some effort to revise their workmen's compensation codes on the basis of a careful and comprehensive study of the hazards of occupation in which minors are employed. Also, it is recommended that the employment of children under 16 in connection with machinery of any kind be prohibited, and that minors of 16 and 17 should be prohibited from operating dangerous machinery not guarded at the point of operation, as well as from the operation of elevators, and in such other occupations as have been proved by accident records to be hazardous. As regards provisions directly relating to minors injured in industrial accidents, the report called for the passage of legislation in which the employees' future earning capacity was to be considered as the basis for computing compensation to minors permanently disabled, and that minors injured while illegally employed be brought under the workmen's compensation law and be entitled to the award of extra compensation.

The section on the administration of laws affecting the employment of minors consisted in large part of a discussion and criticism of administrative procedure, and of methods relating particularly to the issuance of employment certificates, the proper enforcement of school attendance laws, and the inspection of establishments and imposition of penalties for violation. The report pointed out that the careful enforcement of laws relating to minors of school attendance age was at the heart of the whole problem. Also, inspection of places of employment played a significant part since it was the only method by which regulations applying to children at work could be enforced. This section of the report recommended the following administrative procedures: adequate legal provisions as to employment certificate issuance, including standards for evidence of age and proof of physical fitness; the enforcement of school attendance; provision of official personnel qualified by education and training, and adequately compensated and appointed under civil service laws; and supervision of State agencies in the development of effective administration of these activities.

NEW YORK. The New York law requires children of the ages 14 and 15 seeking work to possess employment certificates indicating the completion of certain grades of school work. Since 1915 children aged 16 and 17 years must also have a certificate testifying to their physical fitness and giving proof of age. Up to March, 1928, this requirement applied only to cities with a population of 5000 and over, but since that year it has been enforced throughout the State. A compilation made by the New York Department of Labor indicates an almost continuous decrease of the number of employment certificates issued to children aged 14 and 15 years in New York City from 1918 to 1930. In 1918 the number of such certificates issued was 50,710; in 1925 the number was 32,814; in 1929 the number was 35,934; while in 1930 the number was 27,319. For children aged 16 and under 17 the number of certificates issued in 1925 was 7376; in 1929 it was 18,841; and in 1930 it was 15,014. Outside of New York City employment the number of certificates issued to children aged 14 to 16 years in 1918 was 16,039; in 1925 it was 16,132; in 1929 it was 18,957; and in 1930 it was 16,250. Certificates issued outside of New York City to children aged 16 and under 17 in 1926 totaled 11,984; in 1929 the number was 10,751; in 1930

the number was 8845. In the depression of 1930 there was a sharp drop in the number of work certificates issued indicating in all probability a decline in child labor. Another index indicates the same general conclusion. Figures of school attendance seem to indicate a tendency to remain in school to a higher age than was formerly the case. This was particularly true of attendance in high school which is not compulsory. Thus, in New York State as a whole in 1918, 171,523 children were in high school attendance as compared with 379,912 in 1929 and 420,310 in 1930. The figures for New York City were 85,136 in 1918, 149,366 in 1929, and 159,832 in 1930. A third index pointed to the same conclusion. This was the total number of children found illegally employed. The total number of children in this category, 6896 in 1920, 5533 in 1921 and thereafter remained below 5000 until 1929 when it reached 5076. However, in 1930 it fell to 3804, a decrease of 25 per cent. The New York Department of Labor draws the following conclusions from these analyses: "Each of the three indexes of the trend of child labor, employment certificate, school attendance and inspection records, has indicated a decrease in child labor in depression years. Similar statistics for the next few years will be of especial interest in showing whether this represents a permanent decline in child labor or merely a temporary fluctuation due to scarcity of jobs."

**MIGRATORY CHILD WORKERS IN NEW JERSEY.** The New Jersey Commission to Investigate the Employment of Migratory Children published in January, 1932, a supplement to its report on migrant children giving information bearing on the loss of schooling. The commission came to the conclusion that the enactment of legislation to regulate the employment of, and to provide schooling for, migrant children was necessary and recommended that the commissioner of labor be given authority to enforce a housing code for the purpose of safeguarding the health of migrant families. The commission was of the opinion that New Jersey was under obligation to come to the assistance of migratory children working in agriculture who were suffering from inadequate schooling.

**INDUSTRIAL ACCIDENTS TO MINORS.** In 1927 *Illinois* made provision for the award of 50 per cent additional compensation to minors injured while illegally employed and fixed the age for minors at 18 years. In 1931, 432 minors under 18 years of age were reported as having suffered industrial accidents of which 412 involving loss of more than 6 working days were compensable. There were 64 accidents to children under 16 years of age. The *Wisconsin* law calls for the issuance of labor permits by the industrial commission for children under 17 years of age and declares as illegal the employment of such minors without permits. Exception is made in the case of certain employments prohibited because of their dangerous nature. Minors of permit age injured while employed without possession of a labor certificate are entitled to double indemnity in cases of industrial accident. A minor injured while employed in a prohibited occupation is entitled to triple indemnity. The law also stipulates that the increased liability cannot be insured and must, therefore, be paid by an employer instead of by an insurance carrier. In 1921, 97 extra compensable cases occurred of which 86 were due to employment without a per-

mit and 10 to employment in prohibited industries. In 1930 the number had dropped to 40 of which 31 were due to employment without permit and 9 to employment in prohibited industries; whereas in 1931, the number had dropped to 17 of which 12 were due to employment without permit and 5 to employment in prohibited industries.

**THE PERENNIAL NEWSBOY.** Mr. Harry M. Shulman, conducting a survey for the New York Child Labor Committee, estimated that over 1000 newsboys were engaged in night selling of newspapers in New York City. He pointed out that of 374 children arraigned for night selling by the Bureau of Attendance of the school system, 61 were under 12 years of age and 165 were 12 or 13 years old. Mr. Shulman's investigations indicated that illegal evening sellers were markedly more retarded in school, more irregular in attendance and much more frequently arraigned as truants than were unselected school children. The *American Child*, the bulletin of the National Child Labor Committee, declared that New York conditions were duplicated in smaller cities. However, newspapers themselves have been seeking more uniform policies and higher standards. The International Circulation Managers' Association recently went on record as advocating that "no boy will be permitted to engage in newspaper work when investigation discloses that such boy's participation is detrimental to his own best interests." Some circulation managers have sought to cope with the problem by inaugurating specific schemes. Thus, the manager of the *Louisville Courier-Journal* has devised a system of cooperation with the schools through an award plan which places a premium upon school achievement. The manager of the *Colorado Springs Gazette-Times* declares: "... we have been able to bear down forcibly on the boy who is getting negligent about school by explaining that only successful students would be kept on our payroll." The National Child Labor Committee reported that policies covering minimum ages of carriers and street sales boys, night street sales methods, time limits on route deliveries, and size of paper bundles carried by children, still remained unsatisfactory. While some papers limited the carrying time the number of papers per boy and put older boys on the morning routes, there were still to be found occurring only too frequently cases of boys rising at three or four in the morning to deliver staggering bundles of 100 or more papers. It was ascertained that in 53 cities, in some seventy observations made at night, a total of 1740 news boys apparently under the age of 14 were roaming business streets from eight in the evening to two in the morning. Of 100 news sales boys taken at random in one city, 44 were 12 years or under.

**FOREIGN NOTES.** The International Labor Conference, at its 1932 convention closing on April 30, adopted a draft convention, by a vote of 89 to 1, fixing the general minimum age of admission of children in non-industrial occupations to 14 years or at the school leaving age, whichever was higher. The convention also authorized light work for children over 12 years subject to specific safeguards and fixing a higher age limit than 14 years for dangerous and unhealthy trades, and for street occupations. The exception was made in the case of India where lower limits were allowed, subject, however, to revision after the passage of five years.

Because of the alarming increase of child labor in Berlin, *Germany*, the school authorities of the city took under advisement plans to check the work of children of school age. The official report of the Berlin schools for the last school year reported an average of 8800 school children gainfully occupied in order to aid in the support of their families. The past histories of these children indicated that 400 had been employed even before entering on their school careers. About 6000 of the working school children were employed for 3 hours daily, 1700 worked from 3 to 4 hours, 750 for 4 to 6 hours and about 200 children for more than 6 hours. In *France*, according to figures published by the French Ministry of Labor in 1929 a total of 84,138 minors under 18 years of age suffered industrial injuries, of which 110 resulted in fatalities and 652 in permanent disabilities.

On August 27, 1931, in *Mexico* the Mexican Congress enacted the first comprehensive federal labor law for the country applying to both manual and mental workers. The minimum age for employment was fixed at 12 years; children under 16 years were not to be employed for more than 6 hours a day; while the working day for all older persons was to be 8 hours. Children under 16 and women were to be prohibited from working between the hours of 8 p.m. and 6 a.m. as well as being engaged in a long list of designated unhealthful or dangerous occupations. The code made it compulsory for employers to furnish schools in localities more than two miles from a town wherever there were more than 20 children of school age.

In *Sweden* the child labor law of June, 1931, incorporated child labor provisions in harmony with the standards established by the international draft convention. This fixed 14 years as the minimum age for both sexes for employment in factories, work shops, construction, transportation and in mines and quarries. For work underground the minimum age was set at 16 years. For all other types of activity the minimum age was raised from 12 to 13 years. In November, 1930, *Turkey* adopted its first public health law with specific provisions prohibiting the employment of children less than 12 years old, restricting the hours of work for persons under 16 to 8 hours a day, and declaring illegal night work for children less than 16 years of age.

**CHILD PSYCHOLOGY.** See **PSYCHOLOGY**.

**CHILDREN'S BUREAU, U. S.** See **CHILD WELFARE; WELFARE WORK**.

**CHILD WELFARE.** The friends of the child welfare movement in the United States owe a great debt to the Federal Children's Bureau. The year 1932 marked the twentieth anniversary of the creation of this Bureau by Congress. The act, which was signed by President Taft on Apr. 9, 1912, put the United States into the forefront among civilized nations of the world as having created a central agency designed to promote the welfare of children primarily and of their mothers as well. Since 1921 similar organizations have been established in 28 countries. The Children's Bureau, being a federal agency, has always concerned itself with the collection of facts throwing light on the welfare of children, particularly problems of infant hygiene, mental hygiene, juvenile delinquency, family dependency, infancy and maternity care and the like. When the Federal Maternity and Infancy Act was passed in 1921, establishing a

fund for the promotion of the welfare of mothers and babies, the Children's Bureau was made the focal point about which a comprehensive programme of activities revolved. Largely as a result of the Bureau's stimulus, 124,000 child health conferences were held, 3,000,000 home visits were made by nurses, and hundreds of thousands of leaflets were disseminated to reach mothers in special classes and in their homes. Undoubtedly the marked decline in infant mortality in the country—from 100 per 1000 births in 1915 to 62 per 1000 births in 1931—was due to the enlightened and comprehensive character of this programme. Unfortunately the act was permitted to lapse in 1929. As a result of the depression the position of the Bureau has become perhaps even more significant in view of the fact that it is to-day a national clearing house for the collection of information and the dissemination of advice concerning the problems of children in families where chief sources of support have been wiped out. The centering of the Bureau's attention on such problems as malnutrition among dependent children, the startling appearance of a roving boy population, the incidence of juvenile delinquency and the like, has helped the American public to appreciate that there are victims of the depression whose problems cannot be lost sight of lest we are prepared to permit the accumulated heritage of these years to trouble the country for a long time to come. For these reasons friends of the Bureau have marked with great misgiving the economy programme of Congress which apparently has made the Children's Bureau one of the leading sufferers. The original estimates of the Senate appropriations committee recommended a reduction of \$100,000 in the Bureau's appropriation or a cut of 25 per cent; fortunately the Senate committee was prevailed on to halve its cut so that while the Bureau's appropriation was pared down by \$50,000, its effectiveness was not entirely destroyed. Nevertheless, it is to be regretted that in the interests of economy the Bureau, with the conclusion of the fiscal year 1931-32, was compelled to suspend its very useful *Child Welfare News Summary*, thus depriving newspapers, and interested social welfare agencies, of an important index to the progress and problems in the child welfare field.

One of the most significant activities of the Children's Bureau has been its devotion to a child welfare code of standards for the country. Miss Grace Abbott, its chief, has been outspoken in her insistence that the nation has a deep obligation to carry out as regards the welfare of children in order to insure the well-being of future generations. Thus, in the programme outlined by her in the May issue of *Parents' Magazine* Miss Abbott lays out the following 10-year programme for the children of America: (1) Reduction of the infant mortality rate from 62 per 1000 births to 34 per 1000 births. (2) A reduction of the 6,000,000 improperly nourished children by at least 3,000,000. (3) An increase of the number of counties having trained probation officers and adequate children's court mechanism to 2000. (4) Raising the minimum age of entry into work to 16 years. (5) The establishment of economic security for all families in order to eliminate definitely dependence upon child labor for the support of families. On this point Miss Abbott says:

What will be done during the next ten years to insure regular employment or support during unemployment is a child welfare as well as an industrial question. Many American children have suffered great losses in what one hopes may be our last great war with destitution. One of the declarations of what has been called the Children's Charter is that we should insure "every child the right to grow up in a family with an adequate standard of living and the security of a stable income as the surest safeguard against social handicaps." Since this ambition was voiced at the White House Conference, we have moved backward rather than forward in the economic independence of the working man. The minimum wage rates which are fixed by the employer, negotiated by employer and employee or determined by government rate fixing agencies, will be important factors in determining the welfare of children. Prevention of accidents and reduction of sickness among parents, also reduce the number of dependent children.

Miss Abbott also stressed the need for maintaining children in their own homes regardless of economic conditions and voiced the hope that, if separations from the home were necessary, adequate foster homes could be found.

**WANDERING BOYS.** One of the most startling effects of the depression in the United States was the springing up overnight of a vast body of wandering boys who, apparently compelled to leave their homes to shift for themselves, were taking to the highways of the country to support themselves precariously and on whatever fortune brought them. Estimates made of this army of wandering boys during the year ranged from 200,000 to 500,000. Whatever the number, there was no doubt that the Children's Bureau statement that the problem "transcends anything the country has yet known" was a just analysis and, therefore, reason for serious national concern. The Children's Bureau, enlisting the services of Dr. A. M. McMillen, of the Social Service Department of the University of Chicago, in the preliminary investigation of the situation, was able to disclose a group of highly significant facts. These pointed out that boys accustomed to the hitherto decent standards of living were going, for days at a time, without taking off their clothes to sleep, without regular meals, without proper medical attention to prevent the setting in of serious acute ailments, without regular shelter and other comforts of life. Jobs were hard to find, transportation from one community to another was practically limited to stolen rides in empty freight cars, and communities, instead of making a serious effort to cope with the problems of these boys, apparently closed their eyes to their needs. The report of the Children's Bureau stressed the fact that the boys were neither defectives nor delinquents. It said:

The traditional single transient of earlier years was the seasonal laborer, the "knight of the road," commonly called the hobo, and the occasional runaway boy or adventurous youth. To-day young men and boys who would normally be at work or in school predominate. Social workers, police, and railroad men, who are in constant touch with these boys, assert their belief that the overwhelming majority of them are young men and boys who would normally be in school or at work, that they are "on the road" because there is nothing else to do—sometimes because sheer pride will not permit them to sit idle at home—sometimes because support for the whole family came from a relief agency, and was wholly inadequate properly to feed the younger children; that they are, on the whole, not of the habitual hobo or criminal types.

The tentative programme suggested by the Children's Bureau proposed that social agencies make the effort to induce boys evidencing signs of restlessness to stay in their own homes. On this score the Bureau insisted that the influence of agencies "must be backed up by concerted action to make conditions more tolerable for the

boy at home." For boys on the road, finding themselves stranded in an alien town or city, the Bureau suggested the establishment of programmes within local communities to protect the boys from as many of the physical and moral hazards of the road as possible. This programme should, as a minimum, include shelter and food of acceptable standards; registration and interviewing; and a training programme to provide for those who cannot be sent home and who should not be passed on. Exact information obtained in New York City indicated how serious the problem was. In a study made by the Emergency Unemployment Relief Committee, whose findings were released in November, it was indicated that approximately 10 per cent of the homeless population of New York was made up of the ages of 16 and 21. The estimated total of this group was put at 5000 boys.

**FAMILY ALLOWANCES.** On Jan. 21, 1932, the French Senate adopted a bill amending the French labor code in order to make family allowances compulsory for all employers. In view of the fact that the Chamber of Deputies had already acted similarly, it was left to the Minister of Labor to put the act into effect gradually by decrees. According to the measure, every employer having on his payroll workers or employees of whatever age or sex in industry, commerce or the liberal professions, was to join a compensation fund made up of employers for the purpose of equalizing among them the cost of family allowances. Family allowances were to be paid for every child residing in France who was dependent on the worker and not over the compulsory school age. In the event of school attendance up to the age of 16, allowances also were to be paid. The minimum allowance for each child was to be determined by an order of the Minister of Labor for each department either for all trades together or for each trade group. In cases of industrial accidents, family allowances were to be maintained in full during the period of temporary disability; in cases of permanent disability or death, allowances were to be paid to such children as, by reason of their age, had a right to them.

The Quebec Provincial Social Insurance Commission, in a report issued in 1932, gave serious attention to the suggestion that workmen should receive a supplement to their wages in the form of a state grant for each dependent child. The commission set forth the rationale of family allowances in the following words:

We may ask ourselves then what there is of equity and social justice in the salary offered to workmen among us who have to support from 4 to 10 children. Families of that size—and are they not the most worthy of admiration?—must, in order to balance their budget, agree to painful restrictions, even in the case of necessities. The result will be that the large family, needing a larger house, better ventilated, with more sun, will have to remain satisfied with lodgings which are more cramped and less hygienic, because of the necessity of cutting down those expenses which can be curtailed. The same result will follow when it is a question of food and clothing. It will be necessary to reduce to their lowest sum all expenses in this department of the family economy.

The commission pointed out that the friends of family allowances built their case on the fact that the only way of restoring equilibrium in the budget of a large family was by the granting of a progressive allowance for each child in excess of the number of children in the average family in the Province. Such proposals usually took the form of the creation of a collective fund

for the benefit of large families somewhat similar to the accident fund in the case of workmen's compensation. While the commission itself did not endorse the idea of the establishment of family allowances in Quebec, because of existing economic conditions, there was no question that its report was destined to serve as a rallying point for all friends of the movement in the Province.

**MOTHERS' AID.** A study of the Children's Bureau of the status of mothers' aid programmes initiated and administered by State and local agencies was being conducted during the year. It was ascertained that since 1911 all but 3 States had passed legislation providing for aid to mothers with dependent children. A preliminary analysis of the material showed a very uneven development in the local administration of mothers' aid laws in States having no State agencies. In all but 2 of the 16 States in which counties reported directly to the Bureau, aid to mothers was not being granted in some of the counties. In fact, in 7 States which had adopted mothers' aid laws before 1918, from one-fifth to more than four-fifths of the counties reporting had failed to provide funds. It was noted, too, that some counties failed to distinguish between mothers' aid and poor relief, in fact, some even going so far as to make payments in kind. A preliminary estimate of the average monthly grant per family for all counties in each of 16 States indicated that the average amount given varied from a little more than \$8 a month per family to a little more than \$38 a month per family. The depression apparently was having its effects even in this branch of public welfare activity. Statements made in 26 out of the 101 reporting counties in the States of Arkansas, Oklahoma, Texas, and West Virginia declared that aid to mothers had been discontinued during the year or that the size of family grants had been reduced because of lack of funds.

The 1932 session of the Virginia legislature for the first time appropriated funds for State participation in the administration of mothers' aid. Despite the fact that since 1922 there has been on the State statute books a law permitting the State to cooperate with cities and counties to the extent of one-third of the cost of preserving homes in which the father has died, has become mentally incompetent, is imprisoned, has deserted, is divorced or is physically incapacitated to earn a living, such cooperation had not been given. The fact is only one city and two rural counties in the State had been granting mothers' aid. By an appropriation of \$25,000 in 1932 it was agreed by child welfare workers that such an act would stimulate similar activity on the part of local units.

In 1921 approximately 121,000 children were receiving aid in the 40 States having mothers' aid laws on their statute books at that time. In 1931, on the basis of a compilation made by the Federal Children's Bureau, it was estimated that approximately 250,000 children were receiving this form of assistance in their own homes in the 44 States and the District of Columbia having such laws as of June 30, 1931. The Children's Bureau points out that this increase of more than 100 per cent was not due to the addition of the 5 jurisdictions, namely, Kentucky, Mississippi, North Carolina, Rhode Island, and the District of Columbia, which passed mothers' aid acts after 1922. In large measure the great

growth of this form of public relief was caused by the following facts: additions to the number of counties granting aid in the States where the legislation antedated 1922; increased appropriations making it possible to reduce or wipe out waiting lists; better administrative policies; growth in population; and movement of population to larger urban areas where mothers' aid was being granted by local welfare agencies. The number of families aided per 10,000 population for the 44 States and the District of Columbia was 10 families and 28 children, the average number of children per family aided being 2.7. The ratio varied from 1.5 families in the majority of the counties in North Carolina to 24 in Wisconsin. In the year 1931 throughout the country the total amount reported as paid to families due to mothers' aid legislation was \$35,000,000. This sum represented an average annual per capita expenditure for the population in the area granting mothers' aid of 40 cents. The average monthly grant per family for the United States as a whole was \$32.80; but in the individual States it varied from \$6.83 in Arkansas to \$69.31 in Massachusetts. The average grant per family paid in the large cities was \$45.82 a month. From two-thirds of the families information was obtained as to the reasons for receiving aid. In 82 per cent, the father was dead; in 5 per cent, he had deserted the family; in 2 per cent, the parents were divorced; in 3 per cent, the father was in prison; in 4 per cent, he was physically disabled; in 3 per cent, he was mentally disabled. It is interesting to note that in those 10 States and the District of Columbia in which aid was granted not merely to widows alone but to all needy mothers, the percentage of aid for children whose mothers were widows varied from 54 in Washington to 94 in New Hampshire.

**MATERNITY AND CHILD HYGIENE.** While the death rate from puerperal causes as based upon the number of deaths among 100,000 women of child bearing age has shown a steady decline in the 10 States constituting the original birth registration area (from 63 in 1915 to 47 in 1929), the birth rate has also been steadily declining thus indicating that the frequency with which women have been exposed to the dangers of child birth has diminished. The Metropolitan Life Insurance Company Statistical Bureau, therefore, points out that a better indication of the true condition would be found in the ratio of puerperal deaths per 1000 live births. On the basis of such a ratio for 10 States in the original registration area, the Metropolitan Life Insurance Company finds a trend line which is practically horizontal, except for the influenza years of 1918 and 1920. Despite the continuance of the depression the mortality rate for 1931 for the children in the families of wage earners insured by the industrial department of the Metropolitan Life Insurance Company was the lowest ever registered by this agency. For the age group 1 to 14 years, the rate was 2.65 per 1000 or 57 per cent below that for the years 1911 to 1915 and 2 per cent below the prevailing rate for 1930. The greatest decline was found in the rate for the age group 1 to 4 years. The Metropolitan Life Insurance Company indicated that this low mortality was due in part to the decline in deaths from such infectious diseases as diphtheria, measles, scarlet fever, and whooping cough. The tuberculosis rate for children between the ages

of 1 and 14 also reached the new low point in 1931 and the rates from diarrhea and enteritis were the lowest since 1911.

**JUVENILE DELINQUENCY.** These columns have before touched on the activities of the Children's Bureau as regards the compilation of statistics relating to the activities of juvenile delinquency agencies in the United States. The fourth annual report made public by the Bureau covering the record of the year 1930 showed a slightly higher juvenile delinquency rate when comparison was made with the three-year period 1927-29. Ninety-two courts sent in reports for the year 1930 as compared with 96 in 1929, 65 in 1928, and 43 in 1927. The delinquency rate as used by the Bureau is the number of cases of delinquency reported per 1000 boys and girls of juvenile court age by the area surveyed by the court; in 1930 this rate was approximately 1 child out of every 100 children. For 88 of the 92 juvenile courts a total of 53,757 juvenile delinquency cases was reported in 1930. Stealing accounted for 44 per cent of the boys' cases while acts of carelessness or mischief accounted for 27 per cent; whereas, being ungovernable, sex offenses, running away and truancy were the charges which brought most of the girls into the courts. The striking difference between boys' and girls' cases were shown in figures relating to home conditions. In two-thirds of the boys' cases as contrasted with less than one-half of the girls' cases for which information was reported, children were living with both their own parents when referred to the court. In slightly more than one-fifth of the boys' cases but in nearly one-third of the girls' cases one or both parents were dead. The conclusion drawn by the Bureau was as follows: "The lack of normal family life may play a more significant part in the delinquency of girls than of boys. It is generally conceded that the difficulties which bring girls into court are usually more serious in character and probably more nearly related to home conditions than the difficulties of boys."

The Bureau's bulletin, released in December, 1932, *Facts About Juvenile Delinquency, Its Prevention and Treatment*, which summed up the situation over the period 1927-30, insisted that there was no single cause of delinquency and that the foundations of delinquent behavior often were laid in early childhood. The general position of the Bureau may be understood from the following summary remarks in the bulletin:

The problem of delinquency is not a superficial blemish which can be removed with ease. It is an indication of weakness and maladjustment in the whole social organism. We can not hope that it will be eliminated in this generation or the next. Conditions of modern living may even tend to increase it. But this generation may make important contributions to its solution by continued scientific research in problems and methods of treatment, by education of the general public in the nature, causes, and extent of delinquency, and by the mobilization and practical utilization of those resources which every community can and should possess not only for the treatment of the delinquent child but for assistance to parents, teachers, and child-welfare organizations in the wholesome training and education of children to the end that much unnecessary delinquency may be prevented.

On June 11 President Hoover approved a bill authorizing the transfer of cases of juvenile delinquents from the Federal system of criminal justice to juvenile courts in their own communities providing these juvenile courts were willing to accept them. This step grew directly out of the recommendation made by the Na-

tional Commission on Law Observance and Enforcement (Wickersham Commission), whose report was commented on in these columns last year. The act authorized the United States attorney of the district, in which any person under 21 years of age had been arrested for a Federal offense, to forego prosecution in a Federal court and to surrender him to State jurisdiction under the following conditions: First, if it appears that the offender is a delinquent under the laws of any State that can or will assume jurisdiction over him and will take him into custody and deal with him according to its laws. Second, if such surrender will be to the best interest of the United States and of the juvenile offender. Third, the juvenile offender must signify his willingness to be returned or his return must be demanded by the executive authority of the State. In March, probably anticipating such legislation, the Children's Bureau added to its staff Judge Carl Britt Hyatt, who was to spend his time in developing plans for Federal and State cooperation in dealing with juveniles who violate Federal laws. The object of the Department of Justice and the Children's Bureau, cooperating on this programme, is ultimately to have each State assume responsibility in dealing with its own juvenile offenders against Federal laws.

Statistics presented to the New York legislature by the State commissioner of corrections showed that 1 out of every 4 persons over the age of 16 arrested in New York State for 1930 was under 21 years. The number of arrests of persons between 16 and 18 was double the number for the 19 and 20 age groups together. The age group between 16 and 18 years was involved largely in the commission of such serious crimes as automobile theft, burglary, and robbery. About one-third of the persons arrested for homicide were under the age of 35.

The criminal statistics for *England and Wales* for 1930, issued by the Home Office during the year, showed a considerable increase in crime among young persons. Two-thirds of all the persons found guilty of crime were below 30 years and two-fifths of the total were below 21 years. The report points out that the youthful group among the criminals has been regularly increasing despite the fact that the English and Welsh population has been growing older. In the age group 14 to 16 years the rate of delinquency was almost 3 times as high as it should have been to the proportion of the percentage of this group in the whole population; in the age group 16 to 21 years the proportion was between 2 and 3 times as high. Juvenile delinquency was particularly marked in the industrial areas of north of England and of Wales. Undoubtedly the industrial depression, which has continued particularly in the two mentioned areas, accounts for a great increase in the less serious forms of crimes against property.

**MENTALLY SUB-NORMAL CHILDREN.** A study made by the Children's Bureau summarizing the employment histories of mentally deficient boys and girls pointed out that such handicapped young persons were not debarred from becoming self-supporting members of the community despite their inability to continue with public education programmes. The study included seven cities and covered 949 boys and girls who had been pupils in so-called ungraded classes. At the time of the inquiry, from 3 to 7 years after the children had left school, it was divulged that

71 per cent of the boys and 43 per cent of the girls were gainfully employed; only 3 per cent were in institutions either for defectives or delinquents. Some of the results developed by this study were: about one-half of the boys and nearly two-fifths of the girls reporting age on going to work commenced their employment history before they were 16. Most of the boys and girls covered by the study held one position for a long time; in fact, almost three-fourths of the boys and girls worked for one employer at least a year. The girls and boys, for the most part, found employment in unskilled and semi-skilled occupations requiring little, if any, industrial training. Only a few boys had been successful in learning a skilled trade. The boys who were not in manufacturing and mechanical industries usually found occupations as truck drivers or teamsters, helpers to drivers, farm laborers, general helpers in stores or markets and privates in the army or seamen in the navy. The girls not working in factories were in personal and domestic service as a rule. The wages of the boys and girls were not unlike those paid for unskilled and semi-skilled occupations. The median cash wage for boys in their last jobs (the figures being for mostly 1923 or 1924) ranged from \$19 a week in Cincinnati to \$27 a week in Detroit where many were employed in the metal and automobile industries. The girls' median cash wage ranged from \$12.50 a week in Cincinnati to \$16.50 in Californian cities. The study did not show any relation between intelligence ratings of the boys and girls and the steadiness with which they had worked or the number of times they had been discharged. The report stressed two principal needs as having been revealed by the study, viz.: "the need of further development of special training for mentally deficient children" and "the need for the development of a system of placement and supervision of pupils from special and ungraded classes."

**BIRTH CONTROL.** The frequency with which the subject of birth control was discussed in the press, by social work conferences and by public authorities during the year makes particularly interesting an article written by Messrs. R. E. Riegel and L. Eager in the *Current History Magazine* of August, 1932. The birth control movement in the United States dates back to the 1830's when volumes by Robert D. Owen and Charles Knowlton were published. It is true that general interest lapsed for almost thirty years, though literature agitating the adoption of the idea continued to circulate. During the 1860's, 1870's and early 1880's there was a revival of interest, once more to be followed by a recession which lasted until the second decade of the twentieth century. To a very large extent growing out of the agitation headed by Anthony Comstock in the 1870's, though it is true that public opinion to a considerable degree supported Comstock's attitude, a long series of State and federal laws appeared to ban the dissemination of birth control information. During the last twenty years the advocates of birth control have once again renewed the fight, this time receiving great assistance from social and religious groups. The modern movement definitely dates from the appearance of Margaret Sanger on the scene in 1912. Having come into first hand contact with the problem of excessive child birth among the poor as a visiting nurse on the East Side of New York, Mrs. Sanger

made a trip to France and in 1914 returned to the United States to issue the *Woman Rebel* and to agitate for legislative acceptance of the establishment of clinics and the dissemination of information. In recent years the movement has received great support from the pronouncements of religious bodies. The decennial Lambeth Conference of Anglican Bishops, meeting in London in 1930, voted by 193 to 97 to lift the church ban against birth control. In 1931 a committee of the Federal Council of the Churches of Christ in America, an organization representing over 22,000,000 Protestants in twenty-seven denominations, also approved birth control. Perhaps the first religious group in America to take the step was the social justice committee of the Central Conference of American Rabbis, which in 1929 went on record as favoring the lifting of the ban against the dissemination of literature, the opening of clinics and the right of doctors to prescribe contraceptive methods. The birth control controversy was once more before the public as an important social question as a result of the encyclical on Marriage issued by Pope Pius XI in January, 1931, in which the Roman Catholic view of contraception as a mortal sin was again set forth.

The growth of the birth control movement actually dates from 1878 when the first birth control clinic was established in Amsterdam, Holland. In America between 1923 and 1929 alone 31 birth control clinics and birth control centres were founded, many connected with hospitals throughout the country. Birth control groups have been bringing, in recent years, pressure to bear on legislative bodies in an effort to amend existing laws. An organization known as the National Committee on Federal Legislation for Birth Control, with Mrs. Sanger as chairman, was responsible for the introduction of the so-called limited or doctor's bill—which authorized doctors, nurses and midwives to give instruction—in the United States Senate in 1930. Hearings on this bill took place in February, 1931, but the measure died in committee without being presented to the chamber. Since the beginning of 1932 Mrs. Sanger's organization has interviewed 206 members of both houses. A total of 171 Representatives were interviewed of whom 92 reported themselves as favorable, 58 were non-committal and 21 indicated their opposition. A total of 35 Senators were seen of whom 22 were favorable, 7 non-committal and 6 in opposition.

Interest on birth control has become focused particularly in the last two years when vital statisticians have definitely indicated the possibility of declining population in western, southern, and eastern Europe and in the United States before the end of the twentieth century. This is due definitely to a steady decline in the birth rate. Thus, the birth rate in England and Wales for the March quarter 1932 was only 15.3 for 1000 of the population, the lowest ever recorded for the period of the year. In 1870 the rate was 36.3. In London the birth rate for the quarter was 14.0; in the 117 great cities of England the rate was 15.6. The situation was not dissimilar in other large metropolitan areas. In Berlin the rate was 8.8; in Dresden it was 8.9; in Leipzig it was 10.8; in Munich it was 11.0; in Hamburg it was 11.1; in Oslo it was 8.9; in Paris it was 14.5; in New York it was 15.9; in Chicago it was 14.3. According to the Paris correspondent

of the *Daily Mail* of London, as reported in the *Literary Digest* of July 9, 1932, the decrease of births was causing grave concern in France. This correspondent wrote: "It has become so serious that, whereas in 1930 the number of youths called to the colors was 258,000, the contingent for 1935 will, it is estimated, be only 136,000." It was also pointed out that in 1835 the average French family raised 4 children as compared with only 3 in 1896 and 2.2 to-day. In 1931 the surplus of births over deaths in Germany was 305,525 against 416,600 in 1930. In Berlin deaths exceeded births by 10,718. In Italy the birth rate dropped from 27 in 1927 to 25 in 1931. In 1884 the rate was 39. In the United States the rate dropped from 24.3 in 1921 to 18.9 in 1930. The *Daily Mail* writer insists that the main cause of the birth decline is the widespread adoption of birth control. According to him "the time is not far distant when the population of Great Britain will become stationary. Professor Bowley some years ago estimated that it would attain a figure of 48,000,000 twenty years hence, after which it would rise no more. There is now general agreement that the stationary point may be reached in the immediate future."

The question of birth control again came to the fore as a result of the discussions of the Third International Congress of Eugenics held in New York in September. Prof. Henry Fairfield Osborn, while he insisted that eugenics can be the solvent of all our ills, declared that birth control as it is practiced and advocated to-day is a two-edged sword, eliminating alike the fittest and the unfittest. Said Dr. Osborn: "Whatever its benefits in limiting the unfittest, birth control is always in danger still more of limiting the fittest, and thus becoming positively dysgenic or against the interests of the race as a whole in which it is practiced." Dr. Osborn thought that the present propaganda and purpose of the birth control movement were "largely negative and death dealing rather than positive and birth encouraging." Another significant contribution to the discussions of the Congress was the position taken by Prof. H. J. Muller, of the University of Texas, who insisted that the achievement of the eugenicists' ultimate goal was impossible under the capitalistic system of economics. Because of the heavy burden of the cradle, economic considerations rather than genetic worth, according to Professor Muller, must in the main govern human reproduction so far as it is voluntary at all, "and eugenics must remain an idle dream." Professor Muller declared that not subsidies were needed in order to allow for the propagation of the biologically and mentally fit but a society so organized as to assure every one economic plenty.

The question of birth control for the first time seriously assumed the proportions of a public matter when Gov. James R. Beverley, of Puerto Rico, in his first annual report to Secretary of War Hurley, openly advocated birth control as a definite specific for the island's great economic and public health problems. Governor Beverley pointed out a net increase of 20.4 per 1000 in Puerto Rico's population during 1931-32, bringing the total to 1,599,142 or 465.5 to the square mile. Governor Beverley's report declared: "Conditions demonstrate that this population is too large for an area which is and must always remain largely agricultural. Organization of agriculture, encouragement of industries, and voca-

tional training can all help to alleviate the situation, but they will never be sufficient to raise the average standard of living of the people to a satisfactory point with the present density of population and in the present state of technical and agricultural development." The Governor urged, as possible remedies for the acute situation, new industries, heavy emigration, and a decrease in the birth rate.

WHITE HOUSE CONFERENCE OF 1930. During the year there began to appear from the press (published by the Century Company) the extraordinary record of the White House Conference on Child Health and Protection of 1930. When the series is fully published undoubtedly this will be the most complete library pertaining to the problems of American childhood ever gathered together in a single compass. Already published and announced for forthcoming publication are the following:

*In education and training: Administration of the School Health Programme* (which evolves an effective programme of health service and education for schools and gives direction for its administration); *Child Labor* (a comprehensive study of the present day problem, with concrete and practical recommendations for improving conditions); *Children's Reading* (a study of reading habits and the problems of promoting good reading among American children); *Home and School Cooperation* (which makes clear the need of coöperation and the means of bringing it about); *The Home and the Child* (home management viewed in its relation to the health and welfare of the child and his family); *Nursery Education* (a comprehensive survey, with recommendations for improving the usefulness of nursery schools, kindergartens, and day nurseries); *Parent Education: Types, Content, Method* (a complete view of the history, purpose, and present status of the parent education movement); *Safety Education in Schools* (practical suggestions on a vitally important problem); *The School Health Program* (which deals with all phases of the obligation of the school to help safeguard the health of the child); *Social Hygiene in Schools* (which discusses social hygiene and the sex education and training of children); *Special Education: The Handicapped and the Gifted* (a thorough study of what is being done and what should be done in the field of education for exceptional children); *Vocational Guidance* (an authoritative statement of the present status of vocational guidance in the United States and a discussion of its problems and needs).

*In medical service: Body Mechanics: Education and Practice* (a study of the relation of body mechanics and posture to health); *Growth and Development of the Child: Part III Nutrition* (a consideration and evaluation of all the available scientific data bearing upon nutrition); *Health Protection for the Pre-school Child* (which shows what preventive medical and dental services are doing for children under six, with constructive suggestions); *Nutrition Service in the Field and Child Health Centers: A Survey* (a study of nutrition work of field agencies and a survey of child health centres; two separate studies published in one volume); *Obstetric Education* (a comprehensive view of obstetric education in this country); *Pediatrics: Education and Practice* (a critical examination of pediatric education in this country); *Psy-*

*chology and Psychiatry in Pediatrics: The Problem* (a discussion of the relation of psychology and psychiatry to the work of the pediatrician and family doctor).

*In public health: Communicable Disease Control* (methods and practices of controlling communicable diseases among children); *Public Health Organization* (a comprehensive study of the administration of public health services).

*For the handicapped: The Delinquent Child* (which offers a new point of view toward the problems of juvenile delinquency based upon authoritative data); *Organization for the Care of Handicapped Children: National, State, and Local* (practical suggestions for improving official and private services on behalf of handicapped and dependent children).

*Other publications: Growth and Development of the Child—Part IV—Appraisalment of the Child* (a study of the mental and physical factors of growth and development); *Hospitals and Child Health; Growth and Development of the Child—Part I—General Considerations* (various topics of general interest in connection with growth and development); *Growth and Development of the Child—Part II—Anatomical and Physiological Considerations* (discussion of the growth and development of individual organ systems of the body); *Problems of Maternal Care* (basic sciences in relation to embryonic, newly born and maternal life); *Maternal and Early Infant Care* (part of the report of the Committee on Prenatal and Maternal Care); *Education for Home and Family Life* (I. in elementary and secondary schools; II. in colleges. A summary of what is being done by secondary schools and by colleges to educate young people for home and family life); *The Physically and Mentally Handicapped* (basic facts about physically and mentally handicapped children with detailed consideration of a programme for their care and preparation for life); *Milk Production and Control* (public health, economic and nutritional aspects of the nation's milk supply); *Factors in Maternal Mortality* (causes of fetal, newly born and maternal deaths and morbidity); *Summer Vacation Activities* (a study of the problems presented by the summer vacation period, with suggestions for healthful and creative vacation activities).

**CHILE**, ché'li, or chí'li. A South American republic, occupying the Pacific coastal region from Peru to the southernmost point of the continent. Capital, Santiago.

**AREA AND POPULATION.** With the extreme length of 2628 miles and an average width of 177 miles, Chile had a total area of 286,396 square miles after the Tacna-Arica boundary adjustment with Peru in 1929. The population at the census of Nov. 27, 1930, was 4,287,445 compared with 3,731,573 in 1920. With the exception of nomadic Fuegians in the south, about 100,000 Araucanians, and the Changos of the northern coast region, the people are of European descent. The principal cities, with their 1930 census populations, are: Santiago, 696,231; Valparaíso, 193,205; Concepción, 55,591; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458; and Talca, 45,020. For the years 1926 to 1930, annual births averaged 171,058 and deaths 106,124. The average birth rate per 1000 inhabitants was 40.5 and the death rate 25. Immigrants in 1930 numbered 39,270 and emigrants 37,860.

**EDUCATION.** Education is free, and compulsory

for children from 7 to 15 years of age. In 1930, there were 3860 public and private elementary schools, with 559,016 pupils and 9856 teachers; 6 public normal schools, with 1342 pupils; 175 public and private secondary schools, with 51,024 pupils and 2438 teachers; and 10 public commercial schools, with 4229 pupils and 211 teachers. Advanced education is provided by the State University of Chile (3338 students in 1930), the Catholic University at Santiago (1049 students), the National Institute of Santiago, the University of Concepción, and other lyceums and colleges.

**PRODUCTION.** Agriculture in central Chile, mining in the northern zone, and stock raising and lumbering in the South are the chief occupations of the people. Minerals, especially nitrate, normally furnish nearly 90 per cent of the value of all Chilean exports. Manufacturing has increased in importance in central and southern Chile. There were in 1928 about 6,216,000 acres of arable land (3.3 per cent of the total area), 39,075,000 acres of permanent meadow, pasture, and unproductive land, and 11,232,000 acres of woods and forests. The total value of agricultural production in 1930 was estimated at 1,200,000,000 pesos (\$144,960,000), of which 577,000,000 pesos (\$69,702,000) represented grain products, 332,000,000 pesos (\$40,000,000) livestock and dairy products, and 271,000,000 pesos (\$32,737,000) wines and fruits. Livestock in 1930 included 2,323,000 cattle, 4,569,000 sheep, 751,000 goats, 328,000 swine, and 411,000 horses. A survey of the 57,950,000 acres of farm land in 1932 showed that 51,604,600 acres were in 10,000 large estates and 6,345,400 acres in 80,000 small farms.

The 1931-32 crop yields were (in bushels): Wheat, 22,770,000; barley, 2,986,000; oats, 5,664,000; corn, 3,473,000; potatoes, 15,966,000; beans, 2,424,000; and peas, 686,000.

Two-thirds of the mineral output of the continent is mined in Chile. Nitrate deposits of over 3,000,000,000 tons in the northern provinces gave employment to 65,000 persons in 1930. In that year all nitrate companies in Chile were merged under government initiative in the Chilean Nitrate Company (Cosach) in an effort to restrict production and restore profitable prices, undermined by the competition of synthetic nitrate producers. See FERTILIZERS. Chile is second only to the United States in copper production and has estimated reserves of 20,000,000 tons of fine copper, or 45 per cent of the known world deposits. In 1929, three American companies produced 90 per cent of the total copper output. Production of the chief minerals in 1931, with 1930 figures in parentheses, was: Gold, 16,776 fine ounces (17,333); silver, 372,000 fine ounces (760,000); copper, 475,523,000 pounds (485,724,000); iron ore, 712,000 metric tons (1,721,000); nitrate of soda, 1,125,000 metric tons (2,446,000); iodine, 184,000 pounds (1930); coal, 1,107,000 metric tons (1,442,000).

Manufacturing establishments in 1928 numbered 8585, with 96,832 employees, aggregate salaries of 218,008,865 pesos, and an output valued at 1,575,237,072 pesos.

**COMMERCE.** Chile's foreign trade declined 40.1 per cent in 1931 to \$197,369,000 from the 1930 total of \$329,567,000, according to a preliminary report of the Chilean Statistical Bureau. Exports, totaling \$111,816,000, were 30.3 per cent less than in 1930, while imports, amounting to \$85,552,000, declined 49.5 per cent. The mer-

chandise balance of trade was favorable by \$26,264,000, compared with an unfavorable balance of \$8,697,000 in 1930. The leading 1931 exports, with figures for 1930 in parentheses, were: Nitrate, \$55,699,000 (\$71,671,000); copper bars, \$36,999,000 (\$53,658,000); sheep's wool, \$2,687,000 (\$3,819,000); iron ore, \$1,651,000 (\$3,197,000). The chief imports were: Benzine and gasoline, \$3,172,000 (\$4,170,000); sugar, \$2,901,000 (\$3,729,000); woolen cloth, \$2,347,000 (\$5,110,000); sacks, \$2,296,000 (\$2,515,000); diesel oil, \$1,934,000 (\$1,564,000).

Although Chile's import and export trade with the United States dropped heavily during 1931, the United States sold more goods than its closest competitors, Great Britain and Germany, together. Imports from the United States were valued at \$29,354,000 (\$56,609,000 in 1930); from Germany, \$14,424,000 (\$28,567,000); Great Britain, \$13,379,000 (\$25,814,000). Exports to the United States totaled \$33,965,000 (\$40,791,000). The 1932 exports (preliminary) totaled 350,304,000 pesos; imports, 213,830,000 pesos.

**FINANCE.** The Chilean government reported a total deficit of 512,738,552 pesos from its budget operations during the calendar year 1931. Of this sum, 243,310,388 pesos represented the deficit in the ordinary budget, which showed receipts of 783,805,209 pesos and expenditures of 1,027,115,597 pesos. Under the extraordinary budget, expenditures totaled 302,978,709 pesos while receipts amounted to only 106,856,713 pesos, leaving a deficit of 196,121,996 pesos. The final deficit included also expenditures to be liquidated, amounting to 38,436,450 pesos, and expenditures and advances to be liquidated with the product of loans, amounting to 34,869,718 pesos. The final cash deficit was reduced to 412,738,552 pesos as a result of an advance of 100,000,000 pesos made by the Central Bank against the purchase of bonds of the *Campaña de Salitre de Chile* (Cosach). Preliminary budget estimates for 1932 balanced at 597,860,645 pesos, but successive governmental overturns during the year made it difficult to determine the status of the budget. See *History*.

The external bonded debt at the end of 1931 amounted to 2,430,829,000 pesos, and the internal debt to 480,056,792 pesos. In addition, unpaid bank advances to the government on Dec. 31, 1931, amounted to 398,744,053 pesos, making a total national debt of 3,309,629,847 pesos. The total excluded interest and amortization charges on the external debt amounting to 106,840,195 pesos, which were unpaid during 1931. The peso, valued at \$0.1217 at par, exchanged at an average of \$0.1207 in 1931 and in 1932 declined steadily to \$0.0602 in October.

**COMMUNICATIONS.** Chile in 1930 had 5540 miles of railway lines, of which 3600 belonged to the state system and 1940 miles were owned by private, mostly British, interests. At the end of 1931, there were about 24,530 miles of highways, including 65 miles of concrete, 545 miles of macadam, and some 15,400 of gravel and earth roads suitable for motor traffic. During 1931, 116 miles of highway, including 28 miles of concrete and 7 of macadam, were constructed at a cost of about \$3,353,000. Air lines connected the principal cities and the Pan-American Airways linked Chile with most of the other countries of North and South America.

**GOVERNMENT.** Under the Constitution of Oct. 18, 1925, executive power is vested in a presi-

dent, assisted by a cabinet responsible to him, and legislative power in a national congress, consisting of a senate of 45 members, and a chamber of deputies of 132 members, elected by the departments. By an agreement of political parties, in March, 1930, an election to fill half the seats in the Senate and the entire Lower Chamber was waived and the vacant seats were filled through selection by the various parties. The President, who is elected for six years by direct popular vote, is ineligible to succeed himself. President at the beginning of 1932, Juan Esteban Montero, who was elected Oct. 4, 1931, and assumed office Dec. 4, 1931.

## HISTORY

Severe economic depression in Chile had led to the overthrow on July 26, 1931, of President Carlos Ibañez del Campo, the dictator who had ably guided the country for some six years. Throughout 1932 the depression tightened its grip, bringing in its train widespread suffering and increasing political chaos. Successive governments strove to maintain order, relieve distress, and restore economic equilibrium, but all failed. The economic blizzard appeared to have shattered the political morale of the nation. It slumped into a welter of class warfare and political intrigue, in which ambitious military officers played a predominant rôle.

**THE FALL OF MONTERO.** Less than a year after he had succeeded Ibañez as Acting President and six months after his induction as constitutional President, Juan Esteban Montero was overthrown on June 4, 1932, by a comparatively bloodless revolution. His position had become increasingly insecure since the first of the year. With the closing down of mines and factories, unemployment rose to more than 125,000, in a country which normally has a shortage of 10,000 workers. While the unfavorable trade balance was redressed and the moratorium on foreign debt payments was continued, the government fought a losing battle to maintain the stability of the peso. The gold reserves of the Banco Central declined from 447,700,000 pesos in December, 1929, to 165,600,000 pesos in April, 1932. In the latter month (April 19), the government, in effect, abandoned the gold standard and the exchange value of the peso declined from an average of \$0.1006 in April to \$0.06 in May.

The country's economic difficulties were increased by the failure of the world nitrate conference in Lucerne, Switzerland, in the spring of 1932, and the controversy with Argentina over cattle shipments, which led to the closing of the Trans-Andine Railroad. The President was attacked, also, because of his lenient attitude toward American and other foreign corporations operating in Chile, and particularly for his refusal to dissolve Cosach, the great nitrate combine, in which the government held 50 per cent of the shares. The working classes and Left elements, who polled 40 per cent of the total vote in the 1931 Presidential election, grew more and more restive. On February 28, the government announced that it had frustrated a plot to restore ex-President Ibañez to power. On March 8, it arrested Dr. Carlos G. Dávila, Chilean Ambassador to the United States under the Ibañez régime, whose severe criticisms of the government in his newspaper had notably strengthened the opposition. Dr. Dávila was absolved of charges of plotting the overthrow of the government, but

on April 21 his arrest was again ordered on the same charge, and he went into hiding. Meanwhile, on April 10, former President Arturo Alessandri, Montero's opponent in the 1931 election for the presidency, was elected to the Senate. He immediately consolidated the Left parties in a bloc whose principal aim was the dissolution of Cosach.

Depletion of the nation's gold reserve and talk of the abandonment of the gold standard started a run on the Central Bank of Chile and an increase in commodity prices, which led to the fall of the cabinet. About the same time, there were demonstrations for unemployment relief accompanied by some rioting, in various cities. Accordingly, the President on April 8 declared martial law for an indefinite period, upon authorization of Congress. A new cabinet was formed, including four Liberal holdovers from the previous ministry and five new members (two Radicals, two Conservatives, and one Liberal) from the middle-class, professional, and conservative parties supporting the President. Dr. Montero's appeal for support in the crisis, and his strenuous efforts to balance the budget, were generally approved by the press. But on June 4 a revolt broke out at El Bosque aviation school near the capital. The national military police declined to defend the government, which collapsed.

**THE SOCIALIST EXPERIMENT.** Power now resided in the hands of the revolutionary junta, consisting of Dr. Dávila, Gen. Arturo Puga, and Eugenio Matte. Dr. Dávila assumed the title of Provisional President. On June 6 the junta dissolved Congress and appointed a cabinet, in which Col. Marmaduke Grove, head of the revolting military forces, was made Minister of Defense. General Puga became Minister of the Interior. Other posts were held by representatives of the Left parties, including two Socialists, two Communists, two Industrial Progressives, a Radical, and a Democrat. Luis Barriga, a Conservative, held the portfolio of Foreign Affairs. On the same day Dr. Dávila announced that the new government would impose a collective economy on the existing system of private economic activity. Declaring that it was impossible for Chile to revive economically under the capitalistic system, he said it was necessary to progressively nationalize many industries, including the distribution of food. He promised that private property, both Chilean and foreign, and contracts and foreign debts would be respected. His programme called for state monopolies of petroleum, iodine, tobacco, matches, and sugar; state control of banking; government regulation of utilities; reorganization of the Cosach nitrate combine; partial control of industry by the workers; division of large estates; and heavy income taxes.

Despite pledges to the contrary, the junta expropriated foreign deposits in Chilean banks by a decree of June 9 and took over the Viña del Mar Sugar Refinery Company. These actions led to protests by foreign interests, who had investments aggregating about \$1,000,000,000 in Chile. American investments as of Jan. 1, 1932, were estimated by the Foreign Policy Association at \$659,202,000 and British investments as of Jan. 1, 1931, were £68,082,174.

Dissensions soon developed within the junta and on June 12, Dr. Dávila was forced to resign as Provisional President, apparently because he was not sufficiently radical to satisfy his colleagues. He was succeeded by Rolando Merino,

a comparatively unknown figure who served as a puppet for Colonel Grove, the dominating personality in the reconstructed junta. The new government indicated its extremism by appointing Aurelio Nuñez Morgado, a critic of Cosach, as supervisor of the nitrate industry, and by other actions. It had little opportunity to develop a programme, however, for on June 17 Señor Dávila was restored to power by a military counter-revolution.

These developments had forced Dávila to seek support from the Right and his new junta included Senator Armando Cabero, a former member of the Radical party, with which ex-President Montero was affiliated. Nolasco Cárdenas, a former Deputy, was the other member. The Minister of Defense in the new cabinet was General Puga, who had been forced out with Dávila on June 12. Colonel Grove and his colleague, Señor Matte, were banished to an island of the Juan Fernández group in the Pacific.

Faced with the active hostility of conservative as well as radical extremists, the Dávila régime resorted to extreme measures to maintain itself. Railway workers, bakers, and slaughter-house workers struck in protest against the exile of Colonel Grove. The government placed the railways under military control and decreed the death sentence for persons interfering with the manufacture or sale of food or with public utilities. Communist activities were vigorously crushed. Following street disorders in Santiago and Valparaíso on June 20 and 21, the junta published a curfew decree, closing amusement places at 9 p.m. and the streets at 10 p.m. Thereafter conditions improved and on June 25 the curfew law was modified. Meanwhile the government had restored the status of the Central Bank, changed by the Grove régime, engaged four European economists as advisers to the government, returned \$3,000,000 of foreign gold currency to its owners, decreed a moratorium on internal debts (June 20), and announced plans for opening public lands to the unemployed. The effect of these steps was largely nullified by the action of the United States, which is the principal market for Chilean copper, in raising the tariff on copper imports to four cents a pound, commencing June 22.

At this juncture, Dr. Dávila faced a new crisis, when his two colleagues on the junta resigned in protest against his policies. They were said to have demanded an early return to constitutional government. Dr. Dávila responded June 29 with a call for the meeting of a constitutional assembly on October 2 to rewrite the Constitution along socialistic lines. Meanwhile he continued his effort to reduce military and naval expenditures and on July 4 ordered the disbandment of the destroyer division. On this issue, he was confronted with the determined opposition of naval and army officers, who sent an ultimatum demanding his immediate resignation. Dr. Dávila ignored it, believing that he retained the support of the enlisted men in both the army and navy.

Into this confusion and turmoil a new element of danger to the Dávila régime was introduced by the return to Santiago on July 6 of former President Ibañez, who had been in exile in Argentina since his overthrow a year earlier. After conferring with Dr. Dávila, the former dictator on July 7 stated that he was not a candidate for office and urged public support of the government. Two days later he led certain military units

in an attempt to oust Dávila and regain power. Unsuccessful, Ibañez took refuge among the military forces loyal to him and soon afterwards returned to Argentina. Early in September he accepted from Provisional President Dávila the post of Chilean Ambassador in Buenos Aires.

Beset by constant intrigue and conspiracy, Señor Dávila pushed forward his programme of socialization, while striving to obtain diplomatic recognition for his régime from the United States and the other great powers. On July 15, the Chilean Foreign Commerce Institute assumed control of all Chilean exports. Charged with the supervision of the supply of exchange bills, the expansion of markets, the furnishing of capital for industries, and tariff reforms, it had unusual powers for the extension of its powers over agriculture and manufacturing. A National Socialist Legion was formed early in August to support the Socialist government against its Communist and conservative enemies. On August 13 a rising among students at the University of Chile, said to be part of a Communist plot for the restoration of Colonel Grove, caused the proclamation of martial law throughout the country.

The government plan for the elimination of unemployment through the subsidizing of new and old industries to the amount of \$21,210,000 with funds obtained through an increase in the currency was launched on August 29. Complete state supervision of all details of the programme was provided for.

**DÁVILA OVERTHROWN.** Before the feasibility, or lack of feasibility, of this socialist plan could be demonstrated in practice, the Dávila régime was unexpectedly overthrown on September 13 by another bloodless military revolt, led by Col. Arturo Merino Benítez, chief of the Chilean air force. Gen. Bartolomé Blanche, Commander-in-Chief of the Chilean Army, became Provisional President of the new government, which was dominated by high army and naval officers. Immediately there came an open break between General Blanche and Col. Merino Benítez, who demanded that General Blanche resign as Provisional President. A short mutiny of the aviation corps was ended with the capture of Col. Merino Benítez and his supporters at the Ovalle air field on September 15. General Blanche announced his intention of remaining Provisional President until the election of a Constitutional President, set for October 30. There was growing opposition to even a temporary military régime, however. This culminated on September 29 in the formation of a separate civil junta in the northern Province of Antofagasta, which was supported by army units there.

**THREAT OF CIVIL WAR.** General Blanche's tenure of power ended abruptly after an eventful two weeks. The movement for the secession of Antofagasta Province, unless civilian control was restored in the capital, rapidly spread to other provinces and to Santiago itself. Riotous crowds milled in the streets and attacked one of the military barracks. On October 1 General Blanche and the entire cabinet resigned, and on the following day Humberto Oyánedel, president of the Supreme Court, succeeded him as Provisional President. A so-called national fusion cabinet was formed October 4, with Javier Ángel Figueroa as Minister of Interior, to hold office until a new President and Congress were elected. This régime was recognized by the United States and Great Britain on October 21.

The economic strain of the depression and the widening breach between Chilean classes dominated the presidential campaign, which ended October 30. The voting gave Arturo Alessandri, moderate Socialist and President from 1920 to 1924, about 152,800 votes to 57,793 for Col. Marmaduke Grove (radical Socialist and nationalist), 39,140 for Hector Rodríguez de la Sotta (Conservative), 34,984 for Enrique Zanartu (semi-Socialist), and 4248 for Elias Laferte (Communist). Although formerly considered a radical, Alessandri received the support of various conservative as well as moderate elements.

Dr. Alessandri was inaugurated on Dec. 24, 1932. The new cabinet, formed the same day, included some of Chile's ablest men, who were selected without regard to political affiliation. The cabinet members included: Premier and Minister of the Interior, Horacio Hevia; Foreign Affairs, Miguel Cruchaga Tocornal, who was recalled from his post as Ambassador to Washington; Finance, Gustavo Rossa; Education and Justice, Domingo Duran; Defence, Emilio Bello-Codesido; Industry, Alfred Piwonka. President Alessandri pledged himself to a régime of strict constitutionality. He indicated that his policies would be semi-socialistic. The two immediate problems confronting the government were the balancing of the budget and the liquidation of the Cosach issue. The budget deficit for 1933 was estimated at 550,000,000 pesos (about \$33,660,000).

**CHINA.** A state of eastern Asia, established as a republic Feb. 12, 1912. Capital, under the Nationalist government, Nanking. The name of Peking, the former capital, was changed to Peiping in 1929 by a Nationalist decree.

**AREA AND POPULATION.** China comprises 28 Provinces including three in Manchuria, and the dependencies of Mongolia and Tibet, over which it exercises nominal authority. It has an area of over 4,300,000 square miles, or nearly that of the United States and Mexico combined, and a population variously estimated from 442,000,000 to 485,000,000, or about one-fourth of the population of the earth. The 21 Provinces of China proper and Manchuria embrace less than 1,900,000 square miles, but contain 435,000,000 of the population, while the remaining 2,300,000 square miles support less than one-fortieth of the total inhabitants. The estimated area and population of the Provinces and dependencies in 1930 is shown in the table on page 177. Capitals of the respective Provinces are in parentheses. In July, 1931, the Ministry of Interior estimated the total population at 474,487,000. The Chinese Maritime Customs office in 1929 estimated it at 438,933,373, including 19,290,000 in Manchuria. The population of the chief cities, as estimated by the Chinese Post Office, was as follows: Shanghai area, 3,156,000; Greater Shanghai municipality, 1,713,000; International Settlement of Shanghai, 1,008,000; French concession at Shanghai, 435,000; Peiping, 1,000,000; Tientsin, 1,000,000; Canton, 900,000; Chungking, 625,000; Chengtu, 550,000; Nanking, 525,000; Tsinan, 500,000; Soochow, 500,000; Hankow, 490,000; Hanyang, 450,000; Hangchow, 425,000; Mukden (Shenyang), 400,000.

Foreigners in China in 1930 were estimated by the Customs authorities at 361,940, while in October, 1928, the number of Chinese abroad was estimated at about 6,245,682, including 1,456,264 in British South India and Malaya. The

population is predominantly Buddhist, although most Chinese also profess and practice Confucianism and Taoism. Mohammedans, most numerous in the west and north, number approximately 20,000,000. In 1929, there were 2,486,841 native Roman Catholics and, in 1922, 806,926 native Protestants (366,524 communicants).

#### AREA AND POPULATION OF CHINA BY PROVINCES

<i>Province (Capital)</i>	<i>Area in sq. miles</i>	<i>Population</i>

\* The "three eastern provinces," Liaoning (Fengtien), Kirin, and Heilungkiang constitute the geographical region referred to as Manchuria, which on Feb. 18, 1932, was proclaimed the free state of Manchoukuo (State of the Manchus).

<sup>b</sup> Dependencies.

**EDUCATION.** In 1931, there was an estimated total of 10,000,000 children and adults of both sexes attending educational institutions of all grades. Wherever possible, the educational system was being reorganized on the French model. In 1923, the lower primary schools numbered 167,067, with 5,814,375 pupils, and higher primary schools, 10,236, with 582,579 pupils. There are eight government universities at Peiping (two), Wuchang, Kaifeng, Nanking, Sianfu, Tung Luh in Yunnan Province, and Hangchow. In 1928-29, there were 34 universities and colleges and 16 technical colleges in China, including governmental and private institutions, with a total of 19,453 students. A total of 1484 students were studying abroad in 1929-30, including 826 in Japan and 272 in America.

**PRODUCTION.** China has an estimated area of 192,000 square miles of arable land, divided into small holdings averaging about two acres and supporting directly about four-fifths of the population. Production is on a highly intensive basis, there being from two to four crops annually. The republic is the world's largest producer of rice, soy beans, tea, and tung oil, ranks second to Japan in the production of raw silk, and third or fourth in cotton and wheat. Wheat, barley, maize, millet, peas, and beans are chiefly cultivated in the north and sugar, rice, tea, and

indigo in the south. Kaoliang, corn, tobacco, sweet potatoes, fibres, fruits, and vegetables are important crops. The 1931-32 cotton crop was 860,400,000 pounds (1,075,500 pounds in 1930-31).

With coal fields extending over 133,513 acres and an estimated annual output of about 29,000,000 metric tons, China is one of the world's leading coal countries. There are large iron-ore deposits in Shansi, Hopeh (Chihli), Shantung, Manchuria, at Tayeh near Hankow, and in other Provinces. In 1930, the output of salt was 2,562,000 tons; antimony, 14,700 tons; iron ore (1928), about 2,003,000 tons. China ranks first in output of antimony, second in tungsten, and fourth in tin. Petroleum, wolfram, molybdenum, bismuth, gold and silver are produced also.

Industrialization is proceeding rapidly in the larger cities and is also causing fundamental changes in the economic life and social order in the villages near the industrial centres. Cotton and woolen cloth, silk filatures, flour, iron products, and glass are the chief manufactured products. During 1931 the production of cotton yarn was 2,380,671 bales, of which 823,437 bales were produced in Japanese, 1,480,919 bales in Chinese, and 76,315 bales in British-owned mills. The output of cotton piece goods was 16,179,844 pieces. At the beginning of 1932 there were 130 cotton mills, with a total of 4,497,902 spindles and 33,580 looms, of which 45 mills were owned by Japanese, 82 by Chinese, and three by British interests. There are over 200 modern flour mills, some 400 glass factories, and large iron works at Hanyang. Cement, cigarettes, shoes, ships, knit goods, and the products of printing establishments are other leading products. Handicraft industry is extensively carried on in connection with agriculture. The Chinese government has encouraged industrial development in various ways.

**COMMERCE.** The dollar value of China's foreign trade declined in 1931, reflecting adverse economic conditions, but the value in Haikwan taels showed a slight increase, due to the depreciation of the silver tael. The 1931 general imports were valued at \$492,384,000, as against \$610,987,000 in 1930, a decline of 19 per cent, while exports of Chinese products were valued at \$309,222,000, against \$411,628,000 in 1930, a drop of 25 per cent. The 1931 values in Haikwan taels were: imports, 1,448,187,000 (1,328,232,000 in 1930); exports, 909,476,000 (894,844,000 in 1930).

The United States in 1931 displaced Japan as the chief source of supply, furnishing 22.3 per cent of China's net imports, as against 20.2 per cent supplied by Japan and Formosa, 15.2 per cent by Hong Kong, 8.3 per cent by the United Kingdom, and 5.8 per cent by Germany. In 1930, Japan and Formosa supplied 24.6 per cent of the total imports; the United States 17.5 per cent; Hong Kong 16.4 per cent; the United Kingdom 8.2; and Germany 5.2 per cent. On the other hand, Japan increased its purchases from China, while the United States purchased less. Japan and Formosa took 29.1 per cent of all China's exports (24.2 per cent in 1930), against 16.3 per cent by Hong Kong (17.7 in 1930); 13.2 per cent by the United States (14.7 in 1930); 7.1 per cent by the United Kingdom (7 per cent in 1930); and 2.5 per cent by Germany (2.6 per cent in 1930). The distribution of trade among China's five leading customers in 1931 and 1930 is shown in the table on the following page.

## FOREIGN TRADE OF CHINA BY LEADING COUNTRIES

[In thousands of U. S. dollars]

	General imports		Exports, Chinese products	
	1930	1931 <sup>a</sup>	1930	1931
United States . . . .	106,907	108,890	60,665	40,870
Japan and Formosa . .	150,496	98,731	99,615	90,085
Hong Kong . . . . .	100,439	74,178	72,688	50,426
United Kingdom . . .	49,799	40,577	28,828	21,939
Germany . . . . .	31,788	28,277	10,746	7,867
All Countries . . . .	610,987	487,386	411,628	309,222

<sup>a</sup> Net imports. General imports in 1931 totaled \$492,384,000.

The dollar value of the five leading import items in 1931, with 1930 in parentheses, was: raw cotton, \$50,751,000 (\$61,242,000); cotton piece goods, \$25,611,000 (\$53,319,000); sugar, \$25,311,000 (\$39,759,000); wheat, \$24,990,000 (\$5,902,000); and kerosene, \$18,570,000 (\$25,404,000). The five leading export items were: soy beans, \$40,318,000 (\$44,007,000 in 1930); raw silk, \$24,635,000 (\$45,798,000); bean cake, \$18,234,000 (\$22,767,000); cotton yarn, \$12,795,000 (\$8,724,000); and tea, \$11,240,000 (\$12,091,000).

FINANCE. The budget of the Nanking (Nationalist) government has shown increasing deficits since 1928-29. In 1929-30, revenue was 438,063,208 Yuan dollars and expenditure 539,005,919 dollars. For 1930-31, budget estimates placed revenue at 500,000,000 dollars and expenditure at 640,000,000 dollars; for 1931-32, expenses were estimated at 977,087,761 dollars, including military expenditures of 406,617,220 dollars. The chief revenue items in 1929-30 were: Salt tax, 122,146,170 dollars; customs duties, 275,545,215 dollars; rolled tobacco and kerosene, 36,566,506 dollars; wine and tobacco tax, 6,830,995 dollars; stamp tax, 5,426,844 dollars; flour tax, 3,924,260 dollars; miscellaneous, 21,309,161 dollars. Borrowings amounted to 100,942,710 dollars. The principal expenditure items were: Military services, 245,445,112 dollars; loan services, 158,995,288 dollars; civil expenses, 51,470,476 dollars; party expenses, 4,017,000 dollars. The Yuan dollar in 1929 had an average exchange value of \$0.4190. According to the Finance Minister's report, as made public by the Chinese Consulate in New York City in February, 1933, actual receipts and payments in the fiscal year ended June 30, 1931, balanced at \$714,468,144, with military expenses totaling \$311,646,128. For the fiscal year 1931-32, actual receipts and payments balanced at \$682,990,864, with military expenses totaling \$303,777,062.

In 1931 (calendar year) customs revenues increased to 248,314,000 taels from 180,619,758 taels in 1930, but revenue from other sources declined due to floods and disorders. Beginning with July, 1931, the government was forced to reduce sharply interest rates of all domestic bond issues and to virtually double the amortization periods for all domestic bonds. It became increasingly difficult to borrow from Chinese banks or investors. In June, 1932, due to the seizure of the Manchurian customs revenues by the new government of Manchoukuo, the Nanking government reported that customs collections were not sufficient to service the loans secured upon customs receipts. The government in 1932 was further embarrassed by appeals for help from some half dozen of the richest Provinces in the Yangtze valley, which had incurred large deficits as a result of the disastrous floods of 1931. The public debt on Jan. 1, 1931, was equivalent to

about \$743,094,000 U. S., on which arrears of capital and interest amounted to about \$97,100,000 U. S. Internal loans on June 1, 1931, totaled about 741,640,699 Yuan dollars, of which 488,413,139 dollars were secured on customs revenue.

COMMUNICATIONS. At the beginning of 1931 there were approximately 12,335 miles of railway lines in China, excluding 1857 miles in Manchuria, divided into 12 principal systems (two in Manchuria). A section of the Lunghai Railway from Lingpao to Tungkwan, a distance of about 45 miles, was completed in December, 1931. Early in 1932 a section of the projected Hangchow-Kiangshan Railway, from Hangchow to Lanchi, a distance of 125 miles, was placed in operation. Internal traffic, however, is carried on chiefly by means of the numerous canals and rivers. Highways passable to motor traffic extended about 34,810 miles in 1930, of which 1072 miles were macadam and 33,728 miles were improved earth roads. The new Shanghai-Hangchow motor road, 120 miles long, was opened Oct. 10, 1932. A number of air lines were in operation; 52,050 miles of telegraph line connected all the principal cities; telephones were in operation in the chief population centres; and in May, 1931, 21 government radio stations in as many cities provided international services. Vessels entering and clearing Chinese ports during 1930 numbered 180,981, of 155,605,954 tons. Entrances of vessels in the foreign trade totaled 32,580, of 25,690,289 tons; and clearances, 29,837 vessels, of 24,548,479 tons.

GOVERNMENT. The "Organic Law of the Nationalist government of the Republic of China" was promulgated Oct. 4, 1928, by the Executive Committee of the Kuomintang party, which exercises all political power and which assumed control and supervision of the new system of government. The law provided for the establishment of a state council as the highest unit of the National government, composed of from 12 to 16 members, from whom the presidents and vice presidents of five subordinate Yuan, or branches of the government, were selected. The chairman of the State Council was designated head of the government for purposes of representation, with the duties of Commander-in-Chief of the army and navy. The five Yuan (branches) of the government are the Executive, Legislative, Judicial, Examination, and Control Yuan. The Executive Yuan is assisted in the executive work of the government by 10 ministries and 4 boards. The Legislative Yuan, which is the highest legislative organ, consists of between 49 and 99 members appointed by the National government at the instance of the President of the Yuan. By the provisional Constitution, adopted May 12, 1931, to serve until the end of the period of "political tutelage" in 1934, the powers of the chairman of the State Council were extended. He was authorized to select and recommend to the State Council for appointment the chairmen of the five governing Yuan and the chairmen of all governmental commissions.

The Chairman of the State Council, or nominal President of the National government, at the beginning of 1932 was Lin Sen, elected Dec. 27, 1931. The chairmen of the five Yuan were: Executive, Sun Fo; Legislative, Chang Chi; Judicial, Wang Ch'ung-hui; Examination, Tai Chitao; Control, Yu Yu-jen. The Cabinet ministers functioning under the Executive Yuan were: Interior, Li Wen-fan; Foreign Affairs, Eugene

Chen; Military Affairs, Ho Ying-ching; Navy, Chen Shao-kuan; Finance, Huang Han-liang; Industry, Commerce and Labor, Chen Kung-po; Education, C. H. Chu; Railways, Yeh Kung-cho; Communications, Chen Ming-hsu.

### HISTORY

**THE BATTLE OF SHANGHAI.** In January, 1932, the flames of Sino-Japanese conflict in Manchuria and North China spread to Shanghai. For 35 days the fiercest fighting the Far East had witnessed since the Russo-Japanese War raged in China's largest city, while within the International Settlement foreigners and thousands of Chinese refugees lived in daily peril behind the barbed-wire barricades of an international military force.

The struggle developed primarily as a result of the anti-Japanese boycott, which since the Manchurian outbreak of Sept. 19, 1931, had reduced Japan's trade with China by one-third. In Shanghai the boycott had been accompanied by attacks upon Japanese residents of the native city. On January 19, a Chinese mob assaulted five Japanese monks, one of whom died. The following day a Japanese mob attacked a Chinese factory and in the resulting riot two persons (one Japanese and one Chinese) were killed and several hundred wounded. The Japanese immediately took steps to end the boycott by military force. While warships and marines were concentrated at Shanghai, the Japanese Consul-General there presented a note to the mayor of the Chinese city demanding satisfaction for the attack on the Japanese monks, the suppression of anti-Japanese activities, and dissolution of the boycott associations.

The Chinese mayor, Wu Teh-chen, declined to dissolve the private boycott associations, whereupon Consul-General Murai presented him with an ultimatum calling for unconditional acceptance of the Japanese demands by 6 p.m. of January 28. Four hours before the ultimatum expired, Mayor Wu capitulated and the Consul-General stated that his assurances were satisfactory. Several hours later, however, Admiral Shiozawa, in command of the Japanese naval forces at Shanghai, announced that he would "take necessary military action to preserve peace and order in the Chapei district." Shortly after midnight Japanese marines launched an attack upon the native borough of Chapei, using the International Settlement as a base. This action disregarded previous official Japanese assurances that 24-hours' notice would be given to Shanghai consular authorities before military action was resorted to.

To the world's surprise, the Japanese marines made slight progress against the stubborn resistance of the veteran Cantonese 19th Route Army, commanded by Gen. Tsai Ting-chai. After 36 hours of fighting, Admiral Shiozawa halted his offensive and sent for reinforcements, while the Chinese strengthened their defenses of ruined Chapei. This district, normally sheltering 200,000 Chinese, had been battered by Japanese bullets and air bombs and swept by the resulting fires. Subsequent fighting completed its destruction.

The Japanese action inaugurated a period of extreme tension between Japan and the foreign powers having interests to protect in Shanghai. On January 31 the Japanese disarmed the Settlement police within the Hongkew area of the In-

ternational Settlement. Great Britain and the United States immediately protested and both dispatched additional forces to guard their interests in the International Settlement. They received assurances that Japan would not use the Settlement as a military base, but on February 2 fortifications manned exclusively by Japanese were erected around the Hongkew area. Meanwhile the League of Nations, upon invocation of Articles X and XV by the Chinese delegate at Geneva, had appointed a commission to report on the Shanghai outbreak. The United States cooperated with, although not represented upon, the commission composed of official representatives in Shanghai of six leading powers. On February 2, the United States and Great Britain, supported by France and Italy, submitted to Japan and China a five-point plan for the immediate restoration of peace at Shanghai.

Rejecting two of the five points, the Japanese government sent a full division of 11,000 troops to Shanghai to reinforce the 5000 marines already there and launched new attacks upon Chapei and the forts at Woosung, guarding the entrance to the Wangpoo River and Shanghai. At the same time (February 8) Japan advanced an unofficial proposal for the establishment of neutral zones surrounding the five leading Chinese ports of Shanghai, Canton, Hankow, Tientsin, and Tsingtao, to be policed under international supervision. The proposal was abruptly rejected by the United States on the ground that it would violate the Nine-Power Treaty signed at Washington in 1922.

The battle inaugurated at Chapei continued with varying intensity, and with increasing numbers of troops on both sides, until the fall of Kiangwan on March 2 forced the Chinese to withdraw from the environs of Shanghai. Attacks and counter-attacks continued day and night, accompanied by heavy artillery fire and repeated bombardments of Chinese positions by the Japanese air force. Occasional stray shells burst in the International Settlement.

Launching their offensive from Hongkew, the Japanese pushed their lines gradually to the north and northwest, pivoting on Chapei. The most sanguinary fighting occurred at Woosung and at Kiangwan, both of which were reduced to shambles before the Chinese finally gave ground. Before the struggle ended some 120,000 Chinese troops were involved against 70,000 regulars of the Japanese army. Part of the Japanese reinforcements were landed at Liuho on the banks of the Yangtze some distance to the north of Shanghai. From the pincers movement begun by these new troops in conjunction with the main Japanese force at Hongkew, the Chinese commander extricated his army with much skill. The Japanese military forces were commanded at first by Major General Uyeda and later by Gen. Yashimori Shirakawa. Admiral Kichisaboro Nomura succeeded Rear Admiral Shiozawa in command of the naval forces on February 9. The Japanese throughout were aided by uncontested mastery of the air. Up to March 3, the total losses of both armies were estimated at 23,000 killed and wounded, while the property damage in Chapei and Kiangwan amounted to more than \$600,000,000 gold.

**THE EFFORTS TOWARD PEACE.** Throughout the fighting at Shanghai, the major powers and the members of the League of Nations strove unceasingly to end the conflict. The report of the

League's Shanghai inquiry commission, made public at Geneva February 14, was outspoken in its criticism of the Japanese action and declared that "since the 3d of February a state of open war has existed, any pretense of a truce being abandoned." The representatives of the powers continued their representations to the Tokyo Foreign Office without avail. Meanwhile on February 12, the Chinese delegate at Geneva requested the Council, under Article XV of the Covenant, to refer the Shanghai affair to the League Assembly for action. Despite Japan's objections, the Council on February 19 summoned the Assembly for March 3 to consider further action (see LEAGUE OF NATIONS). League authorities on February 29 proposed a peace conference at Shanghai under League auspices and on March 1 Japan accepted these proposals. Besides having virtually obtained their announced military objectives at Shanghai, the Japanese were apparently impressed by the world-wide condemnation of their action, the growing agitation in the United States for a boycott against Japan, and the concentration of the U. S. fleet in the Pacific.

Having cleared the Chinese forces from the immediate vicinity of Shanghai, the Japanese rested on their arms while negotiations for a settlement dragged on before the League committee. The League Assembly, in a resolution of March 4, recommended the initiation of Sino-Japanese negotiations with neutral aid to "make definite the cessation of hostilities and regulate withdrawal of the Japanese forces." It was not until May 5, however, that a truce agreement was formally concluded, under which the Japanese forces gradually withdrew while the Chinese troops retained their existing positions. The supervision of the truce provisions was placed in the hands of a joint committee, composed of two members each representing China, Japan, Britain, France, Italy, and the United States. Reports that the truce agreement included an unwritten Chinese pledge to end the anti-Japanese boycott aroused nation-wide condemnation and increased the unpopularity of the Nanking government. While a group of high Japanese military and civilian officials were reviewing a military parade in Shanghai April 29, a Korean threw a bomb among them. Dr. T. Kawabata, president of the Japanese Residents' Association of Shanghai, was killed and the Japanese Minister to China, Marmoru Shigemitsu, Consul-General Murai, Generals Shirakawa and Uyeda, and Admiral Nomura and others were seriously wounded. General Shirakawa (q.v.) died of his injuries on May 26.

The evacuation of Japanese troops from Shanghai was speeded by the outbreak of large-scale guerrilla warfare in Manchuria (see JAPAN under History). By May 31, there remained only 2500 Japanese bluejackets for garrison duty out of nearly 100,000 Japanese troops landed for action. Chinese police took over control of the former occupied area. Despite orders issued from Nanking May 5 to disband the anti-Japanese boycott associations, the boycott of Japan continued—under cover around Shanghai and openly in Canton and other points. In the first six months of 1932, Japanese exports to China slumped in value by 20,000,000 yen (\$10,000,000 at par), compared with the first six months of 1931. In August, Sino-Japanese tension at Shanghai again became acute and there was an intensification

of the boycott. At the end of the month the Japanese Third Squadron was ordered to Shanghai, following renewed mob outbreaks.

**INTERNAL POLITICS.** Despite the crisis with Japan, political chaos in China became steadily worse during 1932. The prestige of the Kuomintang party and of the Nationalist government at Nanking declined to a low ebb with the apparent failure of Chiang Kai-shek's policy of relying upon the League of Nations and foreign powers to oppose Japan's conquest of Manchuria. There was growing dissension within the government itself over the policy to pursue toward Japan.

The Nanking government, as reconstituted at the end of December, 1931 (see *Government*), was reorganized within a month. Sun Fo, Chairman of the Executive Yuan, and Eugene Chen, Foreign Minister, resigned following the Japanese ultimatum of January 23 at Shanghai. In a statement issued January 25, Eugene Chen declared that China's difficulties were the result of the passive policy pursued by Gen. Chiang Kai-shek in the face of "Japanese violence in Manchuria." He revealed that Chiang had rejected his (Chen's) policy calling for severance of diplomatic relations with Japan and the invocation of Article XVI of the League Covenant, which Chen felt would create a situation necessitating a conference under the Nine-Power Treaty. Chen was succeeded as Foreign Minister by Lo Wen-kan. Wang Ching-wei, Sun Yat-sen's right-hand man, succeeded Sun Fo as chairman of the Executive Yuan. T. V. Soong returned to his old post at the Ministry of Finance and Chiang Kai-shek, who ostensibly had retired in December, continued to exercise control through the chairmanship of the Kuomintang (Nationalist party).

With the development of the battle at Shanghai, the government, fearing that Japan intended to seize the Yangtze Valley and bombard Nanking, established a temporary capital at Loyang and retained only a skeleton administration at Nanking. Preparations for resistance were made in case Japan extended her military operations and some of Chiang Kai-shek's best troops participated in the defense of Shanghai. Chiang, however, persisted in his policy of partial resistance to Japan, partly on account of the increasing Communist threat in his rear. The numerous army planes at his disposal took no part in the battle of Shanghai. Nevertheless, tension between Chinese and Japanese was close to the breaking point at Hankow and Ichang on the Yangtze.

The growing opposition to the Kuomintang's rule was indicated when the government called a national emergency conference to meet at Loyang from April 7 to 12. Delegates from Shanghai asked the termination of government financial support for the Kuomintang and refused to pay homage to the portrait of Dr. Sun Yat-sen. North China leaders announced their secession from the party because of its dictatorial policy and the failure of its foreign and domestic policies. The Loyang Conference determined upon prolonged military and diplomatic resistance to Japan. The policy was not carried out, however, due to diversity of opinion among Chinese political and military leaders. Chiang Kai-shek and his adherents, who opposed military resistance to Japan, urged that the government concentrate upon the suppression of Communism and of internal rebellion, while relying upon the League

of Nations to fight China's battle against Japan. The group headed by Wang Ching-wei urged the diplomatic isolation of Japan and active military resistance, although hoping for assistance from the League. A third faction was opposed to further attempts to unify the country by force. It urged that all leaders be invited to share in the responsibility of government and of united resistance against Japan.

Chiang Kai-shek's policy was pursued in the main throughout the year, without conspicuous success. Although the budget of the central government was showing a deficit estimated at 12,000,000 dollars monthly, the government raised a new loan from Chinese bankers for a six-months' campaign against the Communists. The rapid growth of the Communist movement in central and south China constituted a serious menace to the government. In June, the area under Communist control—chiefly in Hunan, Anhwei, Hupeh, Kiangsi, and Fukien Provinces—was estimated to contain from 50,000,000 to 70,000,000 people. In several Provinces sovietized governments had functioned uninterruptedly for several years. The anti-Communist campaign—the third in as many years—was launched in July under the personal direction of General Chiang. Heavy fighting was reported from widely scattered points in the Communist areas, but as in previous years the campaign ended indecisively.

The Nanking government halted its offensive against the Communists upon the development of a crisis in North China. On July 25, the Chinese authorities imposed a postal blockade against Manchuria following the action of the Manchoukuo authorities in retaining the customs revenues of Manchuria, which had previously brought about 2,800,000 Mexican dollars (\$583,000) monthly into the Nanking treasury. Five days later, Finance Minister T. V. Soong announced that the Nanking government would withhold payment of the Japanese portion of the Boxer indemnity due July 31, which amounted to about \$150,000. Contemporaneously, Japan adopted a threatening attitude, hinting openly that further Chinese opposition to Japan's military occupation of Manchuria would be followed by a Japanese invasion of Jehol and the Peiping-Tientsin district. Foreign Minister Uchida of Japan on July 28 stated that the dismissal of Marshal Chang Hsiao-liang as commander of the Peiping-Tientsin area would avert the necessity of Japanese intervention.

Chang Hsiao-liang (known as Chang Hsüeh-liang until July, 1932) was the young war lord dispossessed of his Manchurian domains by the Japanese in 1931 (see 1931 YEAR BOOK). As an ally of Gen. Chiang Kai-shek, he played an important rôle in maintaining Chiang's power at Nanking. The Japanese demand for his resignation threatened to upset the balance of power in China and to precipitate new civil wars. Following outbreaks in Manchuria which the Japanese attributed to Marshal Chang, Japanese forces were concentrated on August 6 at points north of the Great Wall strategically located for an advance on Peiping. There they remained until the end of the year.

Wang Ching-wei, as the nominal Premier of China, called upon Marshal Chang to resist the threatened invasion with all his forces. According to Wang, Marshal Chang thereupon deluged the Nanking government with telegrams asking

for funds. Chiang Kai-shek refused to unite with Wang Ching-wei in forcing Marshal Chang's resignation and Wang resigned as chairman of the Executive Yuan (August 6) in protest against the government's relation with the young Marshal. In a signed statement, which strikingly revealed Chinese disunity, Wang charged Chang with governing Hopeh (Hopei), Jehol, and Chahar "as a separate country," retaining all national revenue collected in these Provinces and refusing to state the strength of his armies or the amount of military disbursements. "Unless state and regional independence is ended, it would be virtually impossible to resist a strong enemy," Wang Ching-wei asserted. He admitted that similar conditions prevailed in other parts of the country. On August 9, all 11 members of the Cabinet resigned in support of Wang's protest.

Chang Hsiao-liang now went through the formalities of resigning as commander of the Peiping area. On August 15 the Executive Committee of the Kuomintang, accepting his resignation, abolished his post and named a military commission of 18 members, composed of henchmen of Marshals Chang and Chiang, to administer the area for the national government. Deprived of his post, Marshal Chang still retained control through his armies and his alliance with Chiang Kai-shek. While the majority of the Cabinet returned to their posts, Wang Ching-wei persisted in his withdrawal. Finance Minister Soong assumed the post of Acting President of the Executive Yuan. The widening rift between Chiang Kai-shek and influential civilian members of the Kuomintang led by Wang Ching-wei caused Chiang in September to undertake the organization of a "Brown Shirt" Fascist movement, called Chiu Wang-hui (Save-the-Nation Society).

With September, there commenced new outbreaks of civil war which emphasized the disorganization and disintegration of the country in the face of foreign assault. Governor Han Fu-chu of Shantung Province on September 16 suddenly attacked Liu Chen-nien, a minor war lord, allied with Chiang Kai-shek, controlling Chefoo and the surrounding territory. Governor Han defeated Liu in a campaign, but was robbed of the main fruits of his victory when Marshal Chang Hsiao-liang landed marines at Chefoo and seized Tengchow, an important revenue centre of Northern Shantung. The Shantung civil war had not ended before an anti-Nanking insurrection developed in Shensi Province, causing the Provincial Governor, Gen. Yang Fu-cheng, to evacuate Sianfu, the capital. Early in October a similar outbreak occurred in the western Provinces of Szechuan, where local war lords rebelled against the Nanking representative, Gov. Liu Wen-hui.

The Szechuan war involved some 300,000 troops, many of whom were withdrawn from the anti-Communist drive which had been resumed by Gen. Chiang Kai-shek. The result was that Communist armies in western Hupeh Province resumed their offensive, crushed two government divisions, and recaptured Lotien, near Hankow, which was also threatened. The Tibetans, who had been driven back after invading parts of western China earlier in the year, also took advantage of the Szechuan struggle to advance once more. On October 7, Gen. Feng Yu-hsiang emerged from retirement, where he had remained

since his defeat by Chiang Kai-shek and Marshal Chang Hsiao-liang in 1931. These developments, in the face of Chiang Kai-shek's orders and entreaties for peace, presaged the renewal of civil warfare on a scale which would involve Chiang himself. Contemporaneously, some of China's outstanding personalities, led by the philosopher Hu Shih, urged the government to terminate its armed campaign against the Communists. They demanded that the Nanking government take over the Communist programme for the redistribution of the land and recognize the redistribution already made in Communist-controlled areas in order to prevent the impending collapse of "the whole of the rural economic life of China" (see COMMUNISM).

The Chinese capital was removed from Loyang back to Nanking on December 2. On December 15, the third plenary session of the Kuomintang central executive committee opened at Nanking. Dominated by the Chiang Kai-shek and Wang Ching-wei factions, the sessions were attended by several leading Cantonese and ignored by most of the northern war lords. There was slight public interest in the meeting, partly due to a strict censorship of both domestic newspapers and the dispatches of foreign correspondents. On December 21, the committee decided to bring the period of military tutelage to an early close by establishing a national people's assembly in 1933 and by electing by popular vote in 1935 an assembly to draft a constitution. The national assembly, designed to prepare the way for the adoption of a constitution and the elimination of the Kuomintang party government, was to be composed half of members appointed by the government and half of members designated by various public bodies. Its chief function would be the supervision of the national finances. The session closed December 22, with a manifesto announcing the determination of the Kuomintang to safeguard the nation's sovereignty and territory. The Cantonese delegates urged aggressive resistance to Japan, but their proposals were not adopted by the committee.

As though civil and foreign warfare were not enough, China suffered from a severe cholera epidemic, which extended over an area as large as Europe and took thousands of lives. The great floods of 1931, which drove more than 25,000,000 farmers from their lands and inflicted property damage to the extent of several billions of dollars, left as residue some 4,000,000 penniless peasants whose farms were obliterated. These swelled the countless bandit gangs who lived by begging and thieving. In one district alone, the National Flood Relief Commission reported 5,000,000 famine sufferers at the beginning of June. The commission aided more than 6,500,000 flood refugees during the year. Faced by decreasing tax receipts from the oppressed population, the war lords resorted to still more onerous methods of extorting funds to pay their troops and encouraged the illegal growing and sale of opium.

**CHINA AND MANCHOUKUO.** The formal recognition by Japan on September 15 of the new state of Manchoukuo (see JAPAN under *History*) aroused all China to a new pitch of anti-Japanese hostility. On September 12, Lin Sen, chairman of the State Council, threatened a punitive expedition against Manchoukuo. Demonstrations protesting against Japan's act were held in many Chinese cities, while at the same time China

appealed to the League of Nations and the signatories to the Nine-Power Treaty to nullify Japan's recognition of Manchoukuo. On September 24, Finance Minister Soong announced that China would immediately begin to collect import and export duties on all goods moving to or from Manchuria. The publication on October 2 of the report of the Lytton commission, appointed by the League of Nations to investigate the Sino-Japanese dispute over Manchuria, was received with bitter disappointment by the Chinese press and leading politicians but with restrained approval by the Nanking authorities. W. W. Yen, Chinese Minister to Washington, was named head of the Chinese delegation to the crucial session of the League Council held in November to consider the Lytton report (see LEAGUE OF NATIONS). During his absence his place at Washington was filled by Dr. S. Alfred Sze, former Minister to Great Britain. Meanwhile the anti-Japanese boycott in China was intensified and in many cities there was a recrudescence of bitter anti-foreign feeling.

**THE SINO-SOVIET RAPPROCHEMENT.** Disappointment at their inability to enlist more effective support among the western powers caused the Chinese leaders to turn to Moscow in the hope of securing aid against Japan in Manchuria. These negotiations bore fruit on December 12 in the resumption of diplomatic relations, which had been severed since 1927. The announcement was made simultaneously at Geneva by Dr. W. W. Yen, head of the Chinese delegation to the Disarmament Conference, and Foreign Minister Maxim Litvinov of the U.S.S.R. Coming at a time when the League's Committee of Nineteen was seeking the help of the Soviet Union and the United States in conciliating the Manchurian dispute, the announcement caused resentment in Tokyo and enthusiasm in Nanking. It was indicated, however, that there would be no let-up of the anti-Communist campaign in China. The resumption of diplomatic and consular relations was approved by the Kuomintang central executive committee during its plenary sessions. Dr. Yen, was named Ambassador to Moscow, being replaced in Washington by Dr. Alfred Sze. Dimitri Bogomoloff, former Soviet Minister to Poland, was appointed Ambassador to China.

**OTHER DEVELOPMENTS.** The government of The Netherlands in 1932 returned to China the funds thereafter due it as Boxer indemnity. As in the British Boxer Indemnity Agreement, the Netherlands stipulated that 65 per cent of these funds were to be assigned for conservancy works in China under Dutch engineers using Dutch materials, and the balance of 35 per cent were to be applied to cultural purposes. In September the Ministry of Interior issued regulations for the abolition of juvenile slavery throughout the country.

**CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF.** Founded in 1881 by the Rev. Francis E. Clark, D.D., in Portland, Me., the Christian Endeavor world-wide movement reported in 1932 a membership of more than 4,000,000 young persons. These are members of 80,000 Christian Endeavor societies, representing more than 80 denominations, in 105 countries, dominions, and island groups. The 58,000 societies of Christian Endeavor in North America unite to form the International Society of Christian Endeavor. The national unions of all the continents compose the World's Christian Endeavor Union, which is probably the largest youth federation formed for any purpose. In a half century the movement has helped to train 20,000,000 or more young persons for active church membership and leadership, as well as influencing and broadening their personal religious life.

Christian Endeavor members are pledged to certain forms of Christian devotion and expression, and service, "trusting in the Lord Jesus Christ for strength." The principles to which members owe allegiance are as follows: confession of Christ, active service for Christ, loyalty to Christ's church, and fellowship with Christ's people. Most of the societies are affiliated with local churches of the Protestant denominations, but some have been organized at schools, public institutions, prisons, army posts, and aboard merchant vessels and the ships of the U. S. Navy.

A number of societies furnish leadership to smaller churches without stated pastors and are similarly active in home and foreign mission fields. Practically every society conducts a weekly devotional and discussion meeting, and conducts through committees in which every member of the society has specific duties such activities as organized recreation, education for citizenship, social service, local missionary work, missionary and stewardship promotion, church publicity, fellowship work among newcomers to the community, and evangelism. The society promotes regular habits of prayer and daily Bible reading. It has interested and prepared numerous young men and women to enter the ministry, missionary work, or other Christian vocations, as well as assisting many others to make a wise choice of other vocations that could be followed with a Christian spirit.

The societies function interdenominationally not only through the International Society but through 1200 city, county, and district unions, composed of from four or five to several hundred societies, and through unions in most States and provinces. Union officers for the most part are young volunteers, averaging 22 years of age, who assist in the forming of new societies, conduct workers' conferences and local conventions for the younger members, and provide a clearing-house for the exchange of ideas and fellowship among the societies of a designated area. Several of the State unions employ a field secretary for educational and promotional work. The total employed force of the movement, however, is less than 100 persons.

The next biennial convention was to be held July 8-13, 1933, in Milwaukee, Wis. Officers in 1932 were: President, the Rev. Daniel A. Poling, D.D., LL.D.; vice-presidents, the Rev. William Hi-

ram Foulkes, D.D., and the Rev. Howard B. Grose; general secretary, Carlton M. Sherwood. The official magazine is the *Christian Endeavor World* (monthly). Headquarters are in the World's Christian Endeavor Building, Mt. Vernon and Joy Streets, Boston, Mass.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1866. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as The First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The Sunday services of the church are conducted by first and second readers, the former reading from *Science and Health* and the latter from the authorized version of the Bible. In 1932 more than 10,000 practitioners of Christian Science in the United States and other countries devoted their entire time to healing the sick through prayer.

A board of directors administers the affairs of The Mother Church. Its annual meeting was held in Boston June 6, 1932. Reports indicated a yearly expenditure totaling \$1,164,928 from the general fund of the church. During the fiscal year ending May 31, 1932, 92 churches and Christian Science societies, including several university societies, were recognized as branches of The Mother Church, 49 being in North America, 34 in Europe, 2 in Asia, 6 in Australia, and 1 in Africa. The total number of recognized branches was 2592.

Three departments conduct the principal activities of the movement: the Board of Education, Board of Lectureship, and Committee on Publication. The Board of Education instructs and authorizes students to teach Christian Science. The Board of Lectureship consists of 24 members who are engaged in delivering free lectures on Christian Science throughout the world. During 1932 they delivered 3639 lectures, of which 3157 were in the United States, Canada, and Alaska and 482 in foreign fields.

The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It endeavors also to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of The Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a board of trustees according to the Manual of the church. It issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, and four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian (Danish, Swedish, and Norwegian) languages respectively, each with the English translation opposite.

The Benevolent Association of the Church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home in Concord, N. H., is a home for Christian Scientists of advanced years. Robert E. Buffum was president of The Mother Church for the year ending May 31, 1932. The headquarters of the church are at 107 Falmouth Street, Boston, Mass.

**CHRISTIAN UNITY.** See INTERNATIONALISM.

**CHRISTMAS ISLAND.** The name applied to two separate islands, one in the Indian Ocean forming a part of the Straits Settlements (q.v.) and the other the largest atoll in the Pacific Ocean, being over 100 miles in circumference, belonging to the Gilbert and Ellice Islands Colony (British).

**CHRISTY, CUTHBERT.** A British naturalist and explorer, died in the Belgian Congo, May 29, 1932. Born in 1863, he studied medicine at the University of Edinburgh, from which he was graduated in 1892. After traveling in the Argentine and West Indies he went to Africa, and in 1898 became attached, as special medical officer, to the second battalion of the West African field force in Northern Nigeria. In 1900 on the outbreak of a plague in Bombay he was transferred there, and was later made assistant to the Haffkine Bombay Plague Laboratory in Parel. He was appointed a member of the first Uganda Sleeping-Sickness Commission in 1902, and in the following year joined an expedition of the Liverpool School of Tropical Medicine to the Congo. After serving in Ceylon, and in East Africa, Uganda and other parts of Africa, he spent three years (1911-14) conducting a scientific expedition in the Congo for the Belgian government, and during 1915-16 explored and mapped the Nile-Congo divide for the Sudan government. Also, he explored for the British Museum the Bahr-el-Ghazal during 1920-23 and the Nyasa and Tanganyika lakes during 1925-28. In 1930 he was made chairman of the international commission appointed by the League of Nations to inquire into the existence of slavery and forced labor in Liberia. At the time of his death he was again exploring the Congo for the Belgian government. He was the author of *Mosquitoes and Malaria* (1900); *The African Rubber Industry* (1911); and *Big Game and Pygmies* (1924).

**CHRONOLOGY.** The following chronology lists the more important happenings of the year 1932 according to the dates of occurrence. In most cases these are treated in more detail under the respective heads, and to such articles, particularly those on leading countries and states, such as United States, Great Britain, New York, and so forth, the reader is referred. For a list of prominent persons who have died during the year, reference should be made to the article **NECROLOGY** and the important obituary notices there listed.

**January 1**—Hearings on Senator Johnson's investigation into American foreign loans revealed that a total of \$815,000,000, all floated by South American governments, States, or municipalities, was in default.

**3**—Japanese troops occupied Chinchow, Chinese headquarters in Manchuria.

The Government of India again arrested Mahatma Gandhi and outlawed the All-India National Congress, as the civil disobedience campaign was renewed.

**4**—The American Congress reconvened. President Hoover urged immediate action on his reconstruction proposals.

A revolution broke out in Honduras.

**5**—Prime Minister J. A. Lyons completed his new Australian Cabinet.

**6**—The House Foreign Affairs Committee approved an appropriation of \$450,000 for expenses of the American delegation to the Geneva Disarmament Conference.

**7**—Secretary of State Stimson, in notes to both China and Japan, affirmed that the American Government would not recognize any situation, treaty, or agreement brought about in Manchuria by means contrary to the Kellogg-Brinard Pact.

**8**—Lieut. Thomas H. Massie, U.S.N., his mother-in-

law, Mrs. Granville Fortescue, and two sailors of the U. S. Navy were arrested in Honolulu charged with the murder of Joseph Kahahawai, a Hawaiian accused of attacking Mrs. Massie.

The Democratic Presidential campaign got under way at the annual Jackson Day dinner in Washington.

**9**—President Hoover appointed Col. Theodore Roosevelt, Governor of Puerto Rico, as Governor General of the Philippines, succeeding Dwight F. Davis, who had resigned.

A Democratic tariff bill passed the U. S. House, with 12 Republicans and the Farmer-Labor member voting with the Democrats.

Chancellor Brüning declared in Berlin that Germany could not make any more reparation payments.

ber 15 were discussed by President Hoover and President-elect Roosevelt at the White House.

25—American notes to France, Great Britain, and Belgium insisted that the December war-debt installments be paid.

26—Donal Buckley, retired shopkeeper, became Governor General of the Irish Free State.

27—A non-aggression pact between Poland and the Soviet Union was ratified.

28—The Persian Government announced its intention to cancel the petroleum concession held by the Anglo-Persian Oil Company.

President William Green of the American Federation of Labor demanded for labor the six-hour day and the five-day week.

29—A Franco-Soviet non-aggression pact was signed at Paris.

Secretary of Interior Wilbur's Committee on the Costs of Medical Care recommended the greater socialization of medical services.

30—The American Federation of Labor at Cincinnati endorsed State-administered unemployment insurance.

December 2—Lieut.-Gen. Kurt von Schleicher became Chancellor of Germany.

5—The "lame-duck" session of the Seventy-second Congress opened at Washington. Speaker Garner's prohibition repeal measure failed to secure a two-thirds majority in the House.

6—President Hoover's annual message was read in both houses of Congress.

The League Assembly opened a special session to consider the Lytton Report and the minutes of the Council's discussion of the Report.

7—President Hoover submitted to Congress budget proposals calling for expenditures of \$4,218,803,844.

The House Ways and Means Committee opened hearings on the Collier bill to legalize beer and light wine in the United States.

The U. S. Federal Farm Board reported a loss of \$239,000,000 in 1931-32 as a result of its efforts to stabilize wheat and cotton prices.

8—Yosuke Matsuoka, the Japanese delegate, informed the League Assembly that no action its might take would deter Japan from its course in Manchuria.

10—The Paraguayan drive in the Chaco was finally checked. On December 13 the Bolivians resumed the offensive.

11—A declaration indorsing in principle Germany's claim to equality of armaments was signed at Geneva by representatives of Great Britain, Germany, France, Italy, and the United States, paving the way for Germany's return to the Disarmament Conference.

12—Resumption of diplomatic relations between China and the Soviet Union was announced at Geneva.

14—Premier Mussolini, in a speech at Rome, denounced anti-Italian developments in Yugoslavia and by implication placed the blame on France.

16—A revolutionary plot against the government of President Justo was nipped in the bud at Buenos Aires, Argentina.

17—The U. S. Senate passed its bill providing for Philippine independence in 12 years.

18—The Little Entente powers, meeting at Belgrade, Yugoslavia, prepared to resist the drive for revision of the peace treaties.

24—The Pope, in a broadcast address, proclaimed 1933 a Holy Year.

Arturo Alessandri was inaugurated as President of Chile.

28—Aiming to decrease excessive labor turnover, the Soviet Government issued a decree requiring a passport of every citizen over 16 years of age.

29—The House at Washington accepted, 171 to 16, the report on the Senate's Philippine independence bill.

South Africa abandoned the gold standard.

31—The Soviet Five-Year Plan ended in four and a quarter years, with a broad general base for industrialization accomplished.

**CINCINNATI, UNIVERSITY OF.** An institution for the higher education of men and women in Cincinnati, O., founded in 1870. The registration for the autumn of 1932 was 9182. The summer-school enrollment for 1932 was 1162. There were 560 members on the faculty. The endowment funds of the university for the year ended Dec. 31, 1931, amounted to \$8,993,325; the income for the same period was \$2,233,853. The library contained 206,664 volumes. During 1932 Stores and Service Building, Biology Laboratory and Physics Laboratory were completed. President, Raymond Walters, A.M., LL.D.

**CITY AND REGIONAL PLANNING.** Official planning commissions existed in 828 communities of the United States at the beginning of 1932. This was a gain of 42 in a year, according to details published in April, 1932, by the Division of Building and Housing, Bureau of Standards, U. S. Department of Commerce, which summarizes progress in city planning, regional planning and zoning each year. In number of city planning commissions Massachusetts led with 121. New York followed closely with 114. California had 108; Ohio, 79; Pennsylvania, 56; Illinois, 51. Of the 93 cities which had a population of 100,000 or over in 1930, all but 10 had planning commissions, the population of the 83 having been over 34,000,000 and of the 10 without commissions some 2,000,000. South Dakota was the only State without such a commission on Jan. 1, 1932. Besides the 828 official commissions there were 51 unofficial bodies, of which 11 were in New York and 10 in New Jersey. To meet the joint needs of large areas embracing many municipalities there had been created by Jan. 1, 1932, 75 official and 4 unofficial regional planning commissions. Of these official bodies 45 were county commissions and 4 were official State organizations. The county commissions function much more readily than the other regional organizations since they have county governments to base upon. Regional planning for more than a single county finds no local governmental agency in existence upon which to build and from which can spring the power necessary to put regional planning into effect. These lacks have to be met by State legislation setting up new governmental agencies, larger than the county. The only other alternative is voluntary coöperation, generally through private organizations with no legal power. The handicap is still greater where the region for which a plan is desired lies in two or more States. Notable examples of how these obstacles have been met and largely overcome are afforded by The Regional Plan for New York and Environs, covering 11,000,000 population in New York, Connecticut, and New Jersey, and the Philadelphia Tri-State District Plan for 11 counties in Pennsylvania, New Jersey, and Delaware, both outlined in the YEAR BOOK for 1931. Each of these plans was completed in 1931 but the reports upon them were not completed and published until 1932. The New York report extends to eight octavo

and two quarto volumes, besides a number of minor progress reports, issued over a period of several years. The Philadelphia report, which deals with an area having a population of 3,500,000 in 1930, is comprised in a large single volume. Some of its major recommendations, as summarized in the Philadelphia *Record* of May 17, 1932 (which gives many details), are:

Belt line highways providing direct routes for vehicular traffic between sections in the region as well as across it.

Seven additional highway river crossings, either bridges or tunnels, for the Delaware and five for the Schuylkill.

Development of Philadelphia's port.

Five additional airways, an additional air-transport terminal, 25 aerial service bases, 7 auxiliary landing fields and completion of the Hog Island air-rail-marine terminal.

Eight hundred miles of parkways in stream valleys. Development of 130,000 acres of park lands.

Interchange and interconnection of water supplies in the Camden and Trenton areas, sanitary treatment of sewage and waste.

Control of housing by local government regulation.

Not ordinarily classed under either regional or State planning but really a part of one or the other are the vast networks of State highways (made possible only by Federal aid) and many of the great bridges of recent years, as also the Hudson Vehicular Tunnel. (See this and earlier YEAR BOOKS.) This tunnel and the Philadelphia-Camden bridge over the Delaware, have led New Jersey to spend scores of millions of dollars to reinforce its through highways, notably for viaducts leading from the Holland Tunnel across Jersey City, the Hackensack and Passaic Meadows to Newark and Elizabeth, the last link of which was officially opened on Nov. 24, 1932. See BRIDGES.

Progress on the Chicago Plan, formulated years ago by the Chicago Plan Commission, included the completion of the widening of Western Avenue and the extension of Ogden Avenue. The latter is a heavy piece of work recommended in 1916, parts of which are a concrete viaduct, two bascule bridges and a steel viaduct over the intersection of two heavy-traffic streets. This improvement is 2¾ miles long. Western Avenue, for 23½ miles, has been converted from a major street with bottle necks into a main arterial highway. The width of the avenue varied in 18 places from 50 to 330 feet, with an average of only 66 feet. As widened, the minimum width is 100 feet. The plan commission advised widening in 1918. Four successive bond issues were voted from 1919 to 1930 to pay the city's share of the cost. The balance of the cost was met by assessments on 66,200 pieces of property.

For summaries of legislation on city and regional planning and on zoning see yearly bulletins of U. S. Department of Commerce, already mentioned; also April issue of *City Planning* (Boston). The quarterly just named carries news and descriptive articles, as does the *Town Planning Review* (Liverpool, England). Many papers and discussions are given in the 1931 *Proceedings of the National Conference on City Planning* (Philadelphia). See also: Adams, Lewis, and Orton, *Regional Plan of New York and Its Environs*, vol. ii, Graphic Regional Plan, The Building of the City (New York); Adams and others, *Recent Advances in Town Planning* (London and New York); *Planning for Residential Districts*, one of a series of committee reports in book form resulting from the President's Conference on Home Building and Home Ownership (U. S. De-

partment of Commerce, Washington); Warren and Davidge, editors, *Decentralization of Population and Industry: A New Principle in Town Planning* (London).

**CITY GOVERNMENT, CITY MANAGEMENT.** See MUNICIPAL GOVERNMENT.

**CITY OF NEW YORK, COLLEGE OF THE.** See PHILOLOGY, MODERN.

**CIVIC FEDERATION, THE NATIONAL.** See NATIONAL CIVIC FEDERATION, THE.

**CIVIL ENGINEERS, AMERICAN SOCIETY OF.** An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse among men of practical science. The membership as of Nov. 15, 1932, consisted of 19 honorary members (persons of acknowledged eminence in engineering), 5817 members (civil, military, naval, mining, mechanical, electrical, and other engineers in active practice 12 years and qualified to design as well as to direct engineering work), 6285 associate members (those who had been practicing eight years), 2879 junior members (beginners in the profession), 117 affiliate members (persons qualified to cooperate with engineers but not themselves engineers), and five fellows (contributors to the permanent funds of the society, who may not be eligible to membership). There were 56 local sections and 103 affiliated student chapters in colleges and universities throughout the United States.

Three general meetings of the society were held in 1932, the annual meeting, annual convention, and fall meeting. At the annual meeting, held in New York City January 20-22, the following medals and prizes were awarded or papers published in the *Transactions*: the Norman Medal to Floyd A. Nagler and Albion Davis, the J. James R. Croes Medal to John R. Freeman, the Thomas Fitch Rowland Prize to Samuel A. Greeley and William D. Hatfield, and the Arthur M. Wellington Prize to George F. Schlesinger. The sixty-second annual convention, held in Yellowstone Park July 6-9, discussed national parks, the public domain, and engineering projects in the West. Tri-State improvements in the vicinity of Philadelphia were the chief concern of the fall meeting held in Atlantic City, N. J., October 5-8.

At each of the meetings some sessions were under the direction of one or more of the 10 technical divisions, for which papers were presented on their special branches of engineering. Eight research committees, with a total personnel of about 60, were engaged throughout the year in special investigations. Nearly 100 members served on joint boards and committees, with representatives of other societies, for research and standardization.

The society publishes two monthly magazines: *Proceedings*, containing technical papers which are later collated, with discussions, in the yearly volume of *Transactions*; and *Civil Engineering*, which presents news of society affairs and articles of more popular appeal. The *Year Book* contains a list of members and general information about the society. A series of *Manuale*, published at irregular intervals, deal with various topics of engineering interest.

The officers of the society in 1932 were: president, Herbert S. Crocker; vice-presidents, J. N. Chester, H. M. Waite, D. C. Henry, and Arthur S. Tuttle; secretary, George T. Seabury; treas-

urer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirtieth Street, New York City.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** Organized in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office, this organization has sought to accomplish its end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government officials. It also has advocated, on the principle that public office is a public trust, that those best fitted through demonstrated ability and capacity should serve the State.

During 1932 the League urged that an end be made of appointment of presidential postmasters on a political basis. It urged the competitive classification under the civil service law of collectors of internal revenue and their subordinates, and the consolidation with the U. S. Civil Service Commission of all federal agencies having to do with personnel administration. It sought the modification of the executive orders giving veterans preference in appointment to civil service positions.

The league endeavors to secure the adoption and improvement of civil service laws in various States and cities. Reports of its work are issued periodically. *Good Government* is the official organ. The officers in 1932 were: George McAneny, president; W. W. Montgomery, Jr., chairman of the executive committee; Howard R. Guild, chairman of the council; A. S. Frissell, treasurer; and H. Eliot Kaplan, secretary. Headquarters are at 521 Fifth Avenue, New York City.

**CIVITAN INTERNATIONAL.** An organization composed of selected professional and business men throughout the United States and Canada, who have dedicated themselves to unselfish service to their city, county, State, and nation. The first Civitan Club was founded in Birmingham, Ala., in 1917. The name "Civitan" was formed from the Latin "civitas." The motto of the organization is "Builders of Good Citizenship." The organization of field work was begun in 1920, when the international association was formed in Birmingham, and by 1921, when the first annual convention was held, there were 30 clubs. A total of 268 clubs had been chartered by Nov. 1, 1932. The primary requisite for membership is that every applicant be a "duly qualified and registered voter."

Among the outstanding achievements of the Civitan Clubs in 1932 were the awarding of medals to students of the Citizens Military Training Camps who possessed outstanding attributes of citizenship. Many clubs were sponsoring the "Sunbeam and Shadow" radio programme, the plan of which originated with the Miami (Fla.) Civitan Club. It consists of broadcasting appeals of those in distress by number; these appeals are known as "shadows," while the responses for the relief of such unfortunates are known as "sunbeams." The various clubs continued also their work of curbing crime, eliminating tuberculosis, and eradicating communistic activities wherever found. There were the usual agencies of Big Brothers work, Boy Scout camps, parole of first offenders to Civitans for personal observation, Americanization work, city beautification, sponsoring of essay contests on "Good

Citizenship," and in general participation in all matters of civil improvement and humanitarian betterment.

The 1932 convention was held in Baltimore, Md., June 19-23, and the 1933 convention was to be held in Memphis, Tenn. The official organ is the *Civitan* (monthly). The officers for 1932 were: president, Frederick E. Lykes, Asheville, N. C.; vice-presidents, Arthur Crownover, Nashville, Tenn., Dr. Frank P. Topping, Sacramento, Calif., and Herbert Porter, Atlanta, Ga.; international secretary, Arthur Cundy, Birmingham, Ala.; and international treasurer, Claude L. Hagan, Birmingham, Ala. Headquarters are at 800 Farley Bldg., Birmingham, Ala.

**CLAIMS COMMISSION.** See MEXICO under History.

**CLARK UNIVERSITY.** A nonsectarian university in Worcester, Mass., founded in 1889. It comprises a college for men, a coeducational graduate division of arts and sciences, and a coeducational senior college (extension courses) granting the degree of bachelor of education. The registration for the autumn of 1932 was 508 including 270 undergraduates, 91 graduate students, 17 special students, and 130 extension students. The enrollment for the summer session was 181. There were 40 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 140,000 volumes. President, Wallace W. Atwood, Ph.D.

**CLASSICAL ANTIQUITIES.** See ARCHÆOLOGY.

**CLASSICAL STUDIES.** See PHILOLOGY, CLASSICAL.

**CLERK, SIR DUGALD.** A British engineer and inventor, died in Ewhurst, Surrey, Eng., Nov. 12, 1932. He was born in Glasgow, Scotland, Mar. 31, 1854, and attended the Andersonian and the West of Scotland Technical colleges. He was professor of technical chemistry at Glasgow University and also at the Yorkshire College of Science in Leeds. As a result of his invention of the two-stroke Clerk cycle gas engine, he became recognized as an authority on internal combustion engines and was made a director of the National Gas Engine Co., Ltd. His other researches pertained to the properties and possibilities of gaseous fuel and gas lighting, the specific heat of gases and explosive pressure. During the World War he served as director of engineering research for the Admiralty, as a member of the advisory committee for aeronautics of the Air Ministry (being chairman of the internal combustion engine committee), and as a member of the Panel Board of Invention and Research.

Clerk was elected a Fellow of the Royal Society in 1908. He served as president of the Society of British Gas Industries (1906-08), the Incorporated Institution of Automobile Engineers (1908-09), the engineering section of the British Association for the Advancement of Science (1908), and the Institution of Gas Engineers (1919-20). During 1915-17 he was chairman of the council of the Royal Society of Arts. He was a recipient of the Watt Medal (1882) and the Telford Gold Medal (1907), awarded by the Institute of Civil Engineers; the Albert Medal (1922), awarded by the Royal Society of Arts; and the Royal Medal (1924), awarded by the Royal Society. In 1917 he was created a Knight Commander of the Order of the British Empire. Besides many scientific papers he

wrote: *The Theories of Gas Engines* (1891); *The Gas and Oil Engine* (1896); and *The Gas, Petrol, and Oil Engine* (2 vols., 1909-13).

**CLEVELAND COLLEGE.** See WESTERN RESERVE UNIVERSITY.

**CLEVELAND MUSEUM OF ART.** See ART MUSEUMS.

**CLIMATE.** See METEOROLOGY.

**CLIPPERTON ISLAND.** An island in the Pacific, situated some 500 miles southwest of Mexico and 1500 miles northwest of the Panama Canal. In dispute between Mexico and France, it was awarded to France in January, 1931, by the King of Italy acting as arbitrator. It is less than a square mile in area, with 30 inhabitants, and has small phosphate deposits. See MEXICO under History.

**COAL.** The combination of decreased buying power, a winter of marked mildness, and the increasing use of substitute fuels resulted in a further curtailment in coal production in 1932 from the output of 1931 as shown compared with earlier figures in the accompanying table. The reduction in consumption was necessarily followed by labor troubles in many fields where the efforts of the operators to meet competitive prices were in part directed toward securing wage reductions.

**PRODUCTION OF SOFT COAL IN 1932.** The total production of soft coal in the United States, including lignite and coal coked at the mines, was estimated by the U. S. Bureau of Mines at 305,667,000 net tons, a decline of 76,422,000 tons or 20 per cent from the production of 1931, and the lowest output of any year since 1904 when the production was 278,660,000 tons. Until 1931, production since 1913 had not been below 400,000,000 tons annually, and for eight years (1923-1930) had averaged over 500,000,000 tons annually.

**ANTHRACITE PRODUCTION IN 1932.** The production of Pennsylvania anthracite as estimated by the U. S. Bureau of Mines for the 52 weeks of 1932 amounted to 48,350,000 net tons, the lowest annual output in the present century. The estimate as compared with the final figures for the preceding year showed a drop of 10,296,000 tons, a decline of 17.3 per cent, and a drop of 24,578,000 tons since 1929, or 33.1 per cent. The fluctuations in the production of anthracite in a twenty-year period is seen in the accompanying table.

ANTHRACITE PRODUCTION IN THE UNITED STATES  
[Net tons]

1913 . . . . .	91,525,000	1923 . . . . .	93,339,000
1914 . . . . .	90,821,000	1924 . . . . .	87,927,000
1915 . . . . .	88,895,000	1925 . . . . .	61,817,000
1916 . . . . .	87,578,000	1926 . . . . .	84,437,000
1917 . . . . .	99,612,000	1927 . . . . .	80,096,000
1918 . . . . .	98,826,000	1928 . . . . .	75,348,000
1919 . . . . .	88,100,000	1929 . . . . .	73,828,000
1920 . . . . .	89,598,000	1930 . . . . .	69,385,000
1921 . . . . .	90,473,000	1931 . . . . .	58,646,000
1922 . . . . .	54,683,000	1932 . . . . .	49,350,000

Despite the low production both of bituminous and anthracite coals, *Coal Age*, New York, in its annual review number editorially states that leadership in coal is not on the retreat. It points out that the record for the year "shows accident-prevention work, despite the tragedies of last December, establishing a new level for comparison; the anthracite industry making real headway in cost reductions through greater underground mechanization; a bituminous research programme directed and controlled by the indus-

try itself on the rim of reality; fresh and searching exploration of old and new roads to modernization; intensified merchandizing activities reflected in interest in greater refinements in preparation; an increasing percentage of the output of the country loaded mechanically."

Although the lowered output of anthracite was proportionally less severe than that for bituminous, the same general causes hit each industry. In the domestic field, the sale of oil burners and the consumption of fuel oil continued to gain, though not at so rapid a rate as in 1931, with an estimated installation of 86,000 burners against about 110,000 in 1931. In the same period it is estimated that 220,000 range-burner units, using distillate as fuel, were sold against 140,000 in 1931. These are increasingly serious factors in the normally large percentage of domestic consumption, especially of anthracite; for, although in most areas the cost of operation is about the same, the use of fuel oil or distillate saves the user the labor of handling coal and ashes.

In the public utilities and railroads also there has been a noticeable proportionate increase in the use of fuel oil. In 1932 such consumption declined by 4.3 per cent to 7,775,000 barrels in pub-

lic utilities and by 12.2 per cent to 1,750,000,000 gallons in railroads; but coal consumption in the same period in these fields declined 21.7 per cent and 18.5 per cent respectively, according to figures compiled by *Coal Age*.

Natural gas, according to the same authority, also increased its proportion of the domestic, industrial, and commercial fuel utility throughout the country in 1932, although the actual volume declined. In domestic and commercial consumption the decline was about 4.4 per cent, and 10.1 per cent in industrial consumption, excluding field operations, petroleum refining, manufacture of carbon black, and public utilities. In public utilities the consumption of natural gas declined 23.4 per cent in 1932 from the previous year's consumption.

An added factor to the distress of the producers of anthracite was the mild winters of 1931-32 and 1932-33 throughout the New England and Middle Atlantic States which supply the bulk of the domestic market for the industry. Reductions in the price of coal met with little response, for, under the general depression, few householders cared to overestimate the year's requirements and buy beyond their needs.

PRODUCTION, VALUE, MEN EMPLOYED, DAYS WORKED, AND OUTPUT PER MAN PER DAY AT COAL MINES IN THE UNITED STATES IN 1931

[Exclusive of product of wagon mines producing less than 1,000 tons]

Grand total, 1931	441,735,048 <sup>c</sup>	885,250	2.00	589,644	165	749
Grand total, 1930	536,911,136	1,150,057	2.14	644,006	192	834

<sup>a</sup> The output per man per day for the country as a whole, calculated by dividing the tonnage by the product of the number employed at each mine times the number of days worked by the mine, was 5.30 in 1931 and 5.06 in 1930 in the bituminous mines; 2.87 in 1931 and 2.21 in 1930 in the anthracite mines, 4.54 in 1931 and 4.34 in 1930 in bituminous and anthracite mines combined.

<sup>b</sup> The figures relate only to active mines of commercial size that produced bituminous coal in 1931. The number of such mines in the United States was 5,642 in 1931; 5,891 in 1930; 6,057 in 1929.

Size classes of commercial mines in 1931: There were 126 mines in Class 1A (500,000 tons and over) producing 23.6 per cent of the tonnage; 452 in Class 1B (200,000 to 500,000 tons) with 36.3 per cent; 536 in Class 2 (100,000 to 200,000 tons) with 20 per cent; 551 in Class 3 (50,000 to 100,000 tons) with 10.3 per cent; 1,144 in Class 4 (10,000 to 50,000 tons) with 7.7 per cent; 2,833 in Class 5 (less than 10,000 tons) producing 2.1 per cent. Methods of mining in 1931: The tonnage by hand was 40,833,483; shot off the solid, 19,495,654; cut by machines, 302,262,746; mined by stripping, 18,932,881; not specified, 565,182.

<sup>c</sup> Includes 122,894 tons of anthracite stored at collieries.

The Anthracite Institute continued its research work on merchandising and the extension of uses. It also studied retail selling, distribution costs to dealer and to consumer, combustion and heating problems, and the possibilities for extension to new market territories. The Jeddo-Highland Coal Co. introduced a new anthracite range which is designed to interest the householder by supplying the combined attributes of a cooking range, heater for a 6-room house, air humidifier, and hot-water supply.

The estimated monthly production of bituminous coal and anthracite for the full year 1932, as compared with 1931, according to the canvass of the Bureau of Mines is shown in the accompanying table.

**ACCIDENT PREVENTION.** The Director of the Bureau of Mines, Scott Turner, in an article in *Coal Age*, expressed a decided optimism in the conservation of human life in the industry. In 1904 the available figures showed 588 lives lost for each hundred million tons of coal produced; previous to that, in every year but two back to 1870, the cost in lives was over five hundred. By 1931 the safety devices and precautions that had been introduced lowered that cost to 331 lives

**ESTIMATED MONTHLY PRODUCTION OF BITUMINOUS COAL AND ANTHRACITE, 1932-31<sup>a</sup>**

<sup>a</sup> Figures of 1931 production are final. Those for 1932 are estimated.

per hundred million tons. (The preliminary figure for 1932 showed 332). On the assumption of an average of \$5000 as the cost of a fatality to a mining company and the dependents of the miner, he estimated that the safer conditions of work represent an actual annual saving of \$4,500,000.

**COBB, NATHAN AUGUSTUS.** An American agricultural chemist, died in Baltimore, Md., June 4, 1932. He was born at Spencer, Mass., June 30, 1859, and was graduated from the Worcester Polytechnic Institute in 1881 and, with the Ph.D. degree, from the University of Jena in 1888. He taught chemistry and natural science for several years at the Williston (Mass.) Seminary. In 1890 he went to Australia as professor of

biology at Sydney University, and the following year was appointed pathologist in the department of agriculture for New South Wales. He also served three years (1898-1901) as agricultural commissioner for New South Wales to the United States and Europe. In 1904 he went to Hawaii as director of the division of physiology and pathology for the Hawaiian Sugar Planters' Experiment Station in Honolulu. On

his return to the United States in 1907 he was made agricultural technologist for the U. S. Department of Agriculture, and also in 1911 became acting assistant chief of the Bureau of Plant Industry. He discovered and described a large number of new species of plants and animals, mostly nematoda. As an inventor he patented several photographic and microscopic devices. He published: *Elements of Chemistry* (1885); *Seed Wheat* (1903); *University Nomenclature of Wheat* (1905); *Methods of Using the Microscope, Camera-Lucida, and Solar Projector for Purposes of Examination and the Production of Illustrations* (1905); *Fungus Maladies of the Sugar Cane* (3d ed., 1909).

**COCHIN-CHINA**, kô'chîn-Chî'na. The southernmost colony in French Indo-China. The territory is ruled directly by a governor and a colonial council of 24 members; it is represented in the French Parliament by one deputy. Governor in 1932, J. F. Krautheimer, appointed in 1929. See FRENCH INDO-CHINA.

**COCOS or KEELING ISLANDS**. See STRAITS SETTLEMENTS.

**CODDLING MOTH**. See ENTOMOLOGY, ECONOMIC.

**COFFEE**. See BRAZIL; COLOMBIA; COSTA RICA.

**COFFER DAMS**. See FOUNDATIONS.

**COFFMAN**, VICE ADMIRAL DE WITT, U. S. N., RET. An American naval officer, died in Jamestown, R. I., June 27, 1932. He was born in Shenandoah Co., Va., Nov. 28, 1854, and was graduated from the U. S. Naval Academy in 1876. During the Spanish-American War he served on the *Terror* and was appointed lieutenant commander in 1899. He became a commander in 1905, captain in 1909, and rear admiral in 1914. During the latter year he was successively commandant of the Boston navy yard and of the Naval War College at Newport. On assuming command of the sixth division of the Atlantic fleet in June, 1916, he was made vice admiral. From August to October, 1917, he commanded the entire Atlantic fleet, and previous to his retirement in November, 1918, he successively commanded the second battleship force and the fifth Naval District and Naval Operating Base at Hampton Roads, Va. He was a member of the board of awards, medals, and honors of the Navy Department until 1919.

**COGHLAN**, ROSE. A British-American actress, died in Harrison, N. Y., Apr. 4, 1932. She was born in Peterborough, England, Mar. 18, 1850, and at the age of 15 made her first appearance on the stage at the Theatre Royal, Greenock, Scotland, as one of the witches in *Macbeth*. Three years later she made her London début in *Linda of Chamouni*, and subsequently appeared in *The Life Chase*, *Wat Tyler*, *M. P.*, *Nell Gwynne*, and *Dotheboys Hall*. She was induced to come to America by E. A. Sothern in 1871, and appeared with him in *Our American Cousin*, *Brother Sam*, and *Dundrarcy Married and Settled*. She returned to England in 1873, where she was leading lady for a time with Charles Mathews and Barry Sullivan and supported Joseph Jefferson in *Rip Van Winkle*. Her more successful vehicles were *Twelfth Night*, *East Lynne*, *All for Her*, and *Lost in London*. In 1877 she reappeared in New York, scoring a success as Mrs. Constant Tiffe in *Marriage*, Countess Zicka in the first American presentation of *Diplomacy*, Clarissa in *Clarissa Harlowe*, and Stephanie in *Forget-Me-*

*Not*. She remained with Wallack's stock company most of the time until 1888, her repertoire there including a wide range from Shakespeare to society comedies and Victorian melodrama. Among the plays in which she appeared were: *As You Like It*; *Camille*; *The Silver King*; *The Queen's Shilling*; *Masks and Faces*; *Moths*; *Lady Clare*; *London Assurance*; *Impulse*; *Our Joan*; *Oaste*; *Town and Country*. For more than two decades afterward she was a favorite Broadway star, being seen in *Jocelyn* (1889); *Nance Oldfield* (1891); *A Woman of No Importance* (1893); *Peg Woffington* (1894); *For the Crown* (1896); *The White Heather* (1897); *The Sporting Duchess* (1897); *The Great Ruby* (1900); *The Second Mrs. Tanqueray* (1903); *Alice of Old Vincennes* (1903); *The Ace of Trumps* (1904); and *The Duke of Killcrankie* (1905). In 1907 she toured the United States in *Mrs. Warren's Profession*, and in 1909 joined the company of the New Theatre in New York, appearing in *The School for Scandal*, *The Winter's Tale*, *The Merry Wives of Windsor*, and *Vanity Fair*. In 1911, after appearing in a revival of *Forget-Me-Not*, she played in *The First Lady in the Land*, in 1913 in *Fine Feathers*, in 1915 in *Tribby*, and in 1917 in *Our Betters*, *The Deserter*, and *The Lady of the Camelias*. Her last appearance was as Mme. Rabouin in *Deburau* in 1920. She was twice married, first to Clinton J. Edgesly, a Boston lawyer, and second, to John T. Sullivan, an actor, both of whom she divorced.

**COINS, VALUE OF FOREIGN**. The legal estimates of the value of foreign coins on Jan. 1, 1933, as issued by the U. S. Secretary of the Treasury are given in the table on page 196.

**COKE**. The production of coke in 1932, according to estimates of the U. S. Bureau of Mines, was 21,939,413 net tons, a decrease of 34.5 per cent when compared with 1931, and lower than the production for any year in the past thirty years. The chief cause of the decrease in coke production was the continued reduced activity of blast furnaces, the output of pig iron for 1932 decreasing 52.5 per cent below the level of 1931, or a decline from 18,271,000 gross tons in 1931, to 8,686,000 gross tons in 1932. The production of beehive coke dropped to 772,500 net tons in 1932, or a decline of 31 per cent from 1,128,337 tons in 1931, and of 72 per cent from 2,776,300 tons in 1930. It was but 3.5 per cent of the total. By-product coke dropped to 21,167,000 tons as against 32,355,000 in 1931, a decline of 35 per cent.

TABLE I—PRODUCTION OF BY-PRODUCT AND BEEHIVE COKE AND PIG IRON IN THE UNITED STATES, 1928-32

Year	Coke—Net tons produced		Total	Pig iron
	By-product	Beehive		gross tons
1928 . .	48,313,025	4,492,803	52,805,828	38,515,714
1929 . .	53,411,826	6,472,019	59,883,845	42,613,983
1930 . .	45,195,705	2,776,316	47,972,021	31,399,105
1931 . .	32,355,549	1,128,337	33,483,886	18,275,165
1932 * .	21,166,913	772,500	21,939,413	8,686,443

\* Preliminary figures.

Production, as will be seen in Table II, declined in every State except Washington, where there was a slight increase. Pennsylvania, the largest producer, showed a decline from 7,524,722 net tons in 1931 to 4,105,599 tons in 1932, a decrease of 45 per cent. The greatest comparative decrease occurred in Colorado, a drop of 80 per

<sup>a</sup> From monthly reports furnished by operators.

<sup>b</sup> Includes an unknown amount of breeze

In 1932, 44 plants connected with iron furnaces produced 11,435,000 net tons of coke, or 54 per cent of the total. The remaining 42 by-product plants produced 9,732,00 tons, or 46 per cent. Preliminary estimates on the recovery of by-products from coke-oven operations in 1932, obtained by assuming that the quantity of by-products recovered during 1932 bore the same relation to the known production of coke in 1932 as in 1931, gives the following:

Tar . . . . .	gallons.	295,000,000
Gas . . . . .	M cubic feet	343,000,000
Crude light oil . . . . .	gallons.	80,000,000

The indicated consumption of coke in the United States during 1932 was 22,314,943 net tons, of which about 8,717,500 tons were consumed by blast furnaces in the manufacture of pig iron, or a drop of 53 per cent from 18,352,500 tons in 1931. The quantity consumed in other ways—manufacture of water gas, domestic heating, the smelting of non-ferrous metals, and miscellaneous industrial purposes—showed a slight rise over 1931 and a slight decrease from 1930, being 13,597,500 net tons in 1932, 13,349,200 tons in 1931, and 13,933,800 tons in 1930. For the manufacture of coke in 1932 in the coke ovens of the United States, it was estimated that 31,785,000 net tons of bituminous coal were required.

**COLGATE UNIVERSITY.** A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1932 there were 972 students enrolled. The faculty numbered 98 members. The productive funds amounted to approximately \$6,500,000, and the income for the year was approximately \$575,000. The library contained 110,000 volumes. President, George Barton Cutten, Ph.D., D.D., LL.D.

**COLLEGES.** See UNIVERSITIES AND COLLEGES; EDUCATION IN THE UNITED STATES.

**COLLINS, ARTHUR.** A British theatrical manager, died Jan. 13, 1932, in London where he was born May 10, 1863. Apprenticed with the

scenic artist, Henry Emden, at the Theatre Royal, Drury Lane, in 1881, he became stage manager at that theatre under the direction of Sir Augustus Harris, in 1887. Ten years later he obtained a lease of Drury Lane and formed a managing company with himself as director. Under his management were produced: *The White Heather* (1897); *The Great Ruby* (1898); *Hearts Are Trumps* (1899); *Ben Hur* (1902); *Dante* (1903); *The Prodigal Son* (1905); *The Bondman* (1906); *The Sins of Society* (1907); *Marriages of Mayfair* (1908); *The Whip* (1909); *Everywoman* (1912); *Scaled Orders* (1913); *The Best of Luck* (1916); *The Garden of Allah* (1920); and *Decameron Nights* (1922). A special performance of *The Pageant of Drury Lane Theatre, 1663-1918*, written by Louis N. Parker, was presented in September, 1918, to celebrate his 21 years at Drury Lane.

**COLOMBIA.** A republic of northwestern South America, third in population and fifth in size among the countries of that continent; touching boundaries with Panama, Venezuela, Brazil, Peru, and Ecuador. Capital, Bogotá.

**AREA AND POPULATION.** The area of Colombia is variously estimated at from 444,200 to 447,536 square miles. The population according to the census of December, 1928, was 7,851,000, as compared with 5,855,077 in 1918. The total population was distributed as follows: Whites, 20 per cent; Negroes, 5 per cent; Indians, 7 per cent; mulattoes, 18 per cent; mestizos, 50 per cent. Bogotá, the capital, had a population of 235,421 at the 1928 census. Other leading cities, with their populations in 1928, were: Barranquilla, 139,974; Cali, 122,847; Medellín, 120,044; Cartagena, 92,494; Manizales, 81,091; Ibagué, 56,333; Cucuta, 49,279; and Bucaramanga, 44,083. For the period 1925-29, deaths averaged 101,901 annually, births 210,234; the rates per 1000 inhabitants were 137 and 28.3, respectively.

**EDUCATION.** Of the population over 10 years of age, 51.57 per cent were literate in 1928, compared with 32 per cent at the census of 1918. Education throughout the Republic is centralized under the Minister of Education, elementary education being free but not compulsory. Primary and secondary schools in 1930-31 numbered 7506, with 458,079 pupils. There were 25 industrial schools, with 1392 pupils, and 17 normal schools, with about 1000 pupils. The University of Bogotá and the School of Mines at Medellín are national institutions; the Universities of Antioquia at Medellín, of Bolívar at Cartagena, of Cauca at Popayan, and of Narino at Pasto are maintained by Departments, or Provinces.

**PRODUCTION.** Coffee is the chief factor in Colombia's primarily agricultural economy. The country ranks second to Brazil in the production of coffee; due to its mild favor, prices of the Colombian product are unaffected by overproduction in Brazil. Coffee accounted for 56 per cent of the value of all exports in 1931 and about 90 per cent of it was shipped directly or indirectly to the United States. The Ministry of Industries in 1930 estimated that 743,554 acres of land were devoted to coffee (mostly in small holdings) and that 437,058,204 coffee trees were in bearing. Coffee production in 1931 amounted to 438,297,000 pounds, as compared to 467,667,000 pounds in 1930. Bananas (exports of 5,424,000 stems in 1931) constitute the second crop of importance. Others are cacao, wheat, sugar, rice, cotton, corn, potatoes, beans, and tobacco. There

are 150,000,000 acres of valuable forests, which include rubber trees and dye and cedar woods.

Colombia is rich in minerals. Production of petroleum, the most valuable mineral product, rose from its discovery in 1921 to a peak of 20,385,000 barrels in 1929, and then dropped to 18,237,000 barrels in 1931. Petroleum exports of 16,989,073 barrels in 1931 represented 15 per cent of the value of all exports. The United States took 67 per cent of the 1931 oil exports (86 per cent in 1928). Gold, platinum, copper, lead, mercury, cinnabar, manganese, emeralds, coal, iron, and salt are also produced. Gold production in 1932 was 248,249 troy ounces, worth \$5,131,306.

COMMERCE. Colombia's foreign trade in 1931 dropped more than 20 per cent in value, as compared with 1930. Exports were valued at 98,009,000 pesos, compared with 112,709,000 pesos in 1930, while imports totaled 41,056,000 pesos, compared with 62,841,000 pesos (peso equals \$0.9733 at par). The 13 per cent decrease in the value of exports was primarily the result of low prices in the world markets for coffee and bananas and the decreased demand for petroleum. Imports fell about 35 per cent below 1930 to the approximate level of 1922. A high protective tariff helped to curtail imports.

The United States furnished only 42 per cent of Colombia's total 1931 imports, as against the normal share of about 45 per cent. Imports from the United Kingdom increased from 12 per cent in 1930 to 16 per cent in 1931, due partly to the depreciated value of the pound sterling. Germany and France maintained their relative positions in the import trade, furnishing about 12 and 5 per cent, respectively. The United States took 83 per cent of all Colombian exports (81 per cent in 1930); Canada, 4.5 per cent (4 per cent). In the 12 months ended June 30, 1932, imports from the United States totaled \$10,581,000 (\$22,449,000 in 1930-31) and exports to the United States were \$69,182,000 (\$84,306,000 in 1930-31). Coffee, petroleum, raw gold, and bananas, in the order named, were the four chief exports. Barranquilla in 1931 handled about 44 per cent of all imports and 41 per cent of the exports of the country.

FINANCE. The ordinary budget of the national government for 1932 as adopted on Dec. 24, 1931, estimated revenues at 39,610,000 pesos and expenditures at 37,610,000 pesos, indicating a surplus of 2,000,000 pesos. However, budgetary developments during the year indicated the possibility of a final deficit. Preliminary estimates for the 1932-33 budget balanced at 35,800,000 pesos. Budgetary operations in 1931 resulted in a deficit of 8,509,829 pesos, with revenues totaling 43,694,101 pesos and expenditures, including 4,634,447 pesos of unpaid obligations, 52,203,930 pesos.

The Institute of International Finance, New York, placed the external bonded debt of Colombia and its political subdivisions in June, 1932, at the equivalent of \$193,732,000, of which about \$175,000,000 represented dollar loans. Of the grand total, the Colombian government's bonded debt was about \$62,350,000; that of its departments, or states, \$61,369,000; of its municipalities, \$22,737,000; and of its mortgage banks, \$47,266,000. In 1931, the amount needed for servicing the external debt was \$16,000,000, or 32 per cent of the estimated revenues for the year. For the government's financial policies see *History*.

COMMUNICATIONS. Colombia in 1930 had 1846 miles of railway lines, divided among 15 systems (11 national and 3 British); 2480 miles were under construction. The Cundinamarca Railway from Villeta to Alban was scheduled for completion in December, 1932. Most of the lines serve as feeders to the Magdalena River, navigable for 900 miles, which is the main traffic route from the Caribbean to the interior. Graded highways in 1930 extended 19,014 miles, including 3560 miles of motor roads. Air lines connected Barranquilla with Bogotá, with Buenaventura, and with Colon, as well as with the chief cities of North and South America. Cargo handled on the Magdalena River in 1931 totaled 368,221 metric tons (444,304 tons in 1930), of which 179,796 metric tons represented upward and 188,425 tons downward traffic. Radio-telephone service between the United States and Colombia was inaugurated Dec. 22, 1932.

GOVERNMENT. Executive power is vested in a president elected for four years by direct popular vote, and ineligible for reelection until four years after the expiration of his term. Legislative power rests with a Congress of two Houses, the Senate and House of Representatives. Senators are elected for four years by the departmental Assemblies, under a new law promulgated Nov. 20, 1930, there being one for every 120,000 inhabitants. Deputies are elected for two years by direct suffrage in the proportion of one to every 50,000 inhabitants. Following the election of May, 1931, there were 117 members in the House of Representatives (56 Conservatives, 52 Liberals, and 9 vacancies) and, after the election of May, 1931, 56 members in the Senate (31 Conservatives and 25 Liberals). President in 1932, Dr. Enrique Olaya Herrera (Liberal), elected for the term expiring Aug. 7, 1934.

#### HISTORY

THE FINANCIAL CRISIS. Repercussions of the world financial crisis of 1931 had been particularly severe in Colombia. Many foreign commercial banks suddenly cancelled the credit which for many years they had granted to Colombian banks. The resultant panic in Colombian financial and commercial circles caused a flight of capital from the country which reduced by one-half the gold reserves of the Bank of the Republic. The loss of gold not only endangered the stability of the peso and caused a contraction of the currency, but created a great credit stringency. To meet the crisis, Congress invested President Olaya Herrera with emergency financial powers, which he exercised from Sept. 24, 1931, to July 31, 1932.

By successive decrees, the President used his extraordinary powers to bolster virtually every major economic and financial activity of the nation against the depression. Decrees were issued regulating and controlling the purchase, sale, and rate of foreign exchange; the production and export of gold; general exports (to insure return of their net value to the country); taxes and customs duties (increased, for the most part); sinking-fund payments (suspended on the entire 200,000,000 pesos of bonded foreign debt); interest payments (suspended payments of more than 8,000,000 pesos on the foreign debt); domestic debts (interest payments on all domestic debts limited and reduced, including that on domestic bonds of the national government and mortgage banks). The President

extended government aid to agriculture and business in the form of a 6 per cent bonus on coffee export drafts; a high protective customs tariff; long-term loans of government funds to banks; and a public-works programme. He also authorized debtors to pay banks in depreciated government and mortgage-bank bonds at par. As a result of government intervention, gold reserves of the Bank of the Republic rose after Mar. 7, 1932.

The foreign debt increased by 14,000,000 pesos during 1932 and the internal debt by 25,000,000 pesos. Of the increase in the foreign debt, 9,000,000 pesos represented the default of one year's service of the foreign bonds of six States and four cities and 5,000,000 pesos defaulted on foreign bonds of two private mortgage bonds. The 25,000,000 increase in the internal debt consisted of a 10,000,000 pesos defense loan, 10,940,000 long-term salt loan advances by the Bank of the Republic, 3,000,000 pesos in 6 per cent bonus bonds issued to coffee exporters, and 1,100,000 pesos of short-term advances by the Bank of the Republic. In addition, the government secured \$1,500,000 in advance banana export taxes and railway rentals from an American company and various government agencies borrowed 900,000 pesos from the Bank of the Republic.

President Olaya Herrera secured from Congress (October 27) the extension of his extraordinary powers until the middle of 1933, but only after heated debate. His emergency measures had antagonized many private groups, particularly the residents of the Atlantic coast departments, who were dissatisfied with the increased cost of foodstuffs resulting from the tariff. The western departments were incensed by the high railway rates, which had enabled the National Railways Administration to operate its lines on a balanced budget since Jan. 1, 1932.

The 1932 session of Congress adjourned on November 16 to July 20, 1933. The legislation passed included a measure for electoral reform, through which the Liberals expected to gain a majority in the Congressional elections of May, 1933; a law authorizing a wife to freely manage or alienate her own property; a law closing the courts to collection and foreclosure actions unless creditors accepted a 30 per cent reduction in principal and a lower interest rate; and a law establishing a new national system for the registration of real property titles.

**OTHER POLITICAL DEVELOPMENTS.** Other developments, not directly related to the economic and financial crisis, served to embarrass President Olaya Herrera. During the hearings before the Finance Committee of the U. S. Senate in January, 1932, on the methods of floating foreign bonds in the United States, the committee investigated charges that the U. S. State Department's successful efforts to obtain reinstatement of the Barco oil concession in Colombia were linked with the payment by the National City Company of New York of the final \$4,000,000 of a \$20,000,000 credit extended to Colombia. It was also charged that Secretary of the Treasury Mellon was financially interested in the Barco concession and that he had discussed the concession with President Olaya Herrera. Both the President and Secretary Mellon formally denied the charges, as did officials of the U. S. State Department.

The President replaced the Minister of War under dramatic circumstances on the night of

May 23, 1932, giving rise to rumors of a plot against the government. The Chief Executive's policy of continuing interest payments on the national foreign debt and on foreign bonds of the Agricultural Mortgage Bank, which were unconditionally guaranteed by the government, aroused increasing hostility. Demands for a moratorium on these remaining foreign interest payments (totaling \$3,750,000 annually) were coupled with attacks upon foreign banks doing business in Colombia.

**DISPUTE OVER LETICIA.** On Sept. 1, 1932, a group of 300 armed Peruvian civilians seized the trading town of Leticia on the Upper Amazon and hoisted the Peruvian flag. Leticia is situated in a fever-infested jungle territory long under dispute between Colombia and Peru but which was awarded to Colombia by a boundary treaty signed in 1922 and ratified in 1927. The cession, made by President Leguía of Peru in exchange for Colombian territory further west, was protested by Peruvian nationalists but the incident of September 1 aroused little concern, particularly after the Lima government gave assurances that the civilians were Communists bent upon creating difficulties for the Sánchez Cerro régime. When the Peruvians remained in control, however, the war spirit quickly rose in Colombia and troops were dispatched to recapture Leticia, despite a Peruvian request that forcible measures be avoided until Peru had an opportunity to deal with its citizens in Leticia.

In both countries war funds were raised by public and private subscription; officers' training camps were established in Colombia and Colombian students in Argentine colleges were notified to return home immediately for military service. On September 30 Peru proposed that the dispute be settled by arbitration, a proposal which Colombia rejected. The extreme difficulty of reaching the territory in dispute from either Colombia or Peru postponed a threatened military clash until mediation of the issue was undertaken by Foreign Minister Blanco of Uruguay on October 6 in his capacity as president of the permanent Inter-American commission of conciliation and arbitration.

Colombia, however, refused to consent to conciliation procedure, asserting that no controversy existed with Peru and that the suppression of the "rebellion" in Leticia was solely a matter of domestic concern in which Colombia could brook no outside interference. A Colombian defense loan of \$10,000,000 was oversubscribed on October 22, a number of transports and war vessels were purchased in the United States and France, and armed forces were dispatched to the disputed territory both overland and via the Amazon River.

Ecuador and Brazil were also drawn into the dispute. Ecuador maintained that its territorial rights in the Oriente region were inadequately safeguarded by the Salomón-Lozano boundary treaty of 1922 between Colombia and Peru and claimed an interest in the settlement of the dispute growing out of the treaty. Ecuador was thus regarded as a potential military or diplomatic ally of Colombia. Brazil, whose boundary line ran less than two miles east of Leticia, dispatched units of its military, naval, and air forces to Tabatinga, a Brazilian army post on the Amazon near Leticia, to safeguard its neutrality. It was also reported to have taken steps to close the Amazon to warships. At the end of

1932, approximately 10,000 troops, 11 warships, and 46 fighting planes were being concentrated in the vicinity of Leticia by the various nations involved and the early outbreak of undeclared war between Colombia and Peru was anticipated (see ECUADOR, BRAZIL, and PERU under *History*).

#### COLON ISLANDS. See ECUADOR.

**COLORADO. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 1,035,791, as against 939,629 in 1920. Denver, the capital, had (1930) 287,861 inhabitants.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops for 1932 and 1931:

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. Bu.</i>	<i>Value</i>
Hay .....	1932	1,640,000	2,159,000	\$13,672,000
	1931	1,620,000	1,937,000 <sup>a</sup>	14,692,000
Wheat .....	1932	680,000	6,699,000	2,278,000
	1931	1,386,000	16,632,000	5,489,000
Sugar beets .	1932	159,000	1,790,000 <sup>a</sup>	( <sup>c</sup> )
	1931	224,000	2,532,000 <sup>a</sup>	13,786,000
Corn .....	1932	1,909,000	13,363,000	2,940,000
	1931	1,836,000	17,442,000	6,279,000
Potatoes ...	1932	100,000	11,000,000	2,750,000
	1931	101,000	9,595,000	3,166,000
Barley .....	1932	439,000	6,804,000	1,293,000
	1931	472,000	7,316,000	1,975,000
Dry beans ..	1932	178,000	3,200,000 <sup>b</sup>	477,000

Oats .....	1932	141,000	3,884,000	711,000
	1931	142,000	3,408,000	920,000

<sup>a</sup> Tons. <sup>b</sup> 100-lb. bags. <sup>c</sup> Not available

**MINERAL PRODUCTION.** Coal, which continued to furnish not far from half of the total yearly value of the State's mineral products, was mined in 1931 to the quantity of but 6,444,000 short tons, as against 8,196,910, in value \$21,485,000, for 1930. The quantity of gold mined increased to 233,299 fine ounces for 1931, from 218,539 for 1930; and to the value of \$4,822,734 (1931), from \$4,517,619 (1930). For 1932 gold production (Mint figures) was 306,668 oz.; by value, \$6,339,400. Silver production, on the contrary, declined to 2,195,194 fine ounces for 1931, from 4,382,852 for 1930; by value to \$636,815 (1931), from \$1,687,398 (1930). For 1932 silver production (Mint figures) was 1,786,701 oz.; by value, \$503,850. Of copper there were mined in 1931 9,028,517 pounds, as against 10,514,000 in 1930; by value about \$640,000 (1931), as against \$1,366,820 (1930). The production of lead was 22,130 short tons, in value \$2,213,000 for 1930; that of zinc (1930) was 36,259 short tons, in value \$3,480,864. The production of petroleum fell to 1,545,000 barrels for 1931, from 1,656,000 for 1930; and to the value of \$825,000 (1931), from \$1,480,000 (1930). The clay products of the State attained the value of \$2,485,684 for 1930; for 1929, of \$3,117,064. The total value of the mineral product of the State, duplications eliminated, was \$46,270,545 for 1930; for 1929, \$55,331,911.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments, \$13,367,268 (of which \$843,770 was for local education); for interest on debt, \$441,023; for permanent improvements, \$7,275,555; total, \$21,083,846 (of which \$9,908,267 was for highways, \$3,156,658 being for maintenance and \$6,751,609 for construction). Revenues were \$22,301,199. Of these, property and special taxes furnished 29.2 per cent; departmental earnings and compensation

to the State for officers' services, 10; sale of licenses, 37.8 (in which was included a gasoline sale tax that produced \$6,112,341). Funded debt outstanding on June 30, 1931, totaled \$8,062,014, of which \$5,830,000 was for highways. Net of sinking-fund assets, the debt was \$7,037,933. On an assessed valuation of \$1,586,462,903 the State levied in the year ad-valorem taxes of \$5,695,402.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 4963.59.

**EDUCATION.** Reductions in the budgets of the bodies governing the public schools were reported as widely prevalent, but were said to have been made for the most part with regard to expert educational advice, with a view to their preserving as much of the service to pupils as the means at command would allow. For the academic year 1931-32 the number of persons of school age in the State was reported as 312,728. There were enrolled in the public schools 260,635 pupils. Of these, 181,211 were in common schools or elementary grades; in high schools, 66,803. Expenditures for education during the year totaled \$26,172,932. Salaries of teachers, by the year, averaged \$1296.

**POLITICAL AND OTHER EVENTS.** The State treasurer accepted for the State in May a gift, from a holder in New York, of \$200,000 in repudiated bonds of North Carolina dating from the reconstruction era. The reported condition of the gift was that Colorado bring suit in the Supreme Court to collect from North Carolina; a suit of this sort had long been sought, as private bondholders were unable to sue the debtor State. Governor Adams declared that he would not authorize a suit. Colorado suffered during the year from the distress prevalent among wage-earning people, and was obliged to borrow \$250,000 from the Reconstruction Finance Corporation in September, to meet expenditures for their relief. The disputed boundary line of Colorado and New Mexico was resurveyed during the summer by Federal surveyors, to correct errors made in 1868 and 1902. The Reconstruction Finance Corporation granted a loan of \$3,850,000 in September to the Denver and Rio Grande Western Railroad Company, with which to build the Dotsero Cutoff, the long-projected 175-mile line between Denver and Salt Lake City by way of the Moffatt Tunnel.

**ELECTIONS.** The popular vote on November 8 gave a strong majority for the Democratic National ticket. The totals were reported officially as Roosevelt (Dem.), 250,877; Hoover (Rep.), 189,617. Alva B. Adams, Democrat, was elected United States Senator for the ensuing full term, defeating Karl C. Schuyler, Republican. For the short Senatorial term expiring on Mar. 4, 1933, Schuyler ran almost even with Walter Walker, Democrat; the result was later decided by a count of the absentee votes, which made Schuyler the winner. Edwin C. Johnson, Democrat, was elected Governor, defeating James D. Parriott, Republican. An initiated measure to repeal the State prohibition law was adopted by popular vote. Another initiated measure, to create a State income tax, was defeated; so also was yet another, to limit State taxes on gasoline to 3 cents a gallon. A referred measure, to put an excise tax on oleomargarine, was rejected by popular ballot.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, William H. Adams;

Lieutenant-Governor, Edwin C. Johnson; Secretary of State, Charles M. Armstrong; Treasurer, John M. Jackson; Auditor, W. D. MacGinnis; Attorney-General, Clarence L. Ireland; Superintendent of Public Instruction, Inez Johnson Lewis.

*Supreme Court:* Chief Justice, John T. Adams; Associate Justices, Haslett P. Burke, John Campbell, John H. Denison, Charles C. Butler, Julian H. Moore, Benjamin C. Hilliard.

**COLORADO, UNIVERSITY OF.** A coeducational. State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1932 was 3092; the summer session enrollment was 2835. There were 330 faculty members, exclusive of assistants. The total income for general maintenance from State tax, fees, tuition, etc., was estimated at \$1,484,051, while \$508,366 was received for the operation of hospitals, including fees. The library contained 246,776 volumes, 20,000 pamphlets, and 3500 maps. President, George Norlin, Ph.D., LL.D.

**COLORADO RIVER PROJECT.** See AQUE-DUCTS.

**COLORÉD METHODISTS.** See METHODIST EPISCOPAL CHURCH, COLORED.

**COLUMBIA UNIVERSITY.** A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway and 116th Street, are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts and New College; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and the non-professional graduate faculties of political science, philosophy, and pure science. The college of physicians and surgeons and the school of dental and oral surgery are on West 168th Street, the college of pharmacy on West Sixty-eighth Street, Seth Low Junior College in Brooklyn, N. Y., St. Stephen's College at Annandale-on-Hudson, N. Y., and the New York Post-Graduate Medical School on East Twentieth Street. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, as well as at several extramural centres.

On the basis of the enrollment on Nov. 1, 1932, the total number of resident students for the year was estimated at 30,861, distributed as follows: Undergraduates, 3402, of whom 1773 were in Columbia College, 1041 in Barnard College, 281 in Seth Low Junior College, 100 in St. Stephen's College, and 207 in other schools; and graduate students, 3139. The distribution of professional students was as follows: Law, 615; medicine, 428; engineering, 286; architecture, 97; journalism, 101; business, 514; dental and oral surgery, 236; pharmacy, 431; optometry, 63; library service, 289; and Teachers College, 6510; 5544 students were enrolled in university classes and 300 were unclassified. Of the 8700 non-resident students, 6000 were registered in home-study courses and 2700 in special and extra-mural courses. There were 11,559 students registered for the summer session of 1932. The grand total is exclusive of 2653 duplicate registrations.

The faculty and officers of administration in

1932 numbered 3289, of whom all but 50 were in active service. This number was distributed as follows: Professors, 388; associate professors, 192; assistant professors, 99; associates, 222; instructors, 511; lecturers, 84; assistants, 286; curators, 4; associates, instructors, lecturers, and assistants in Teachers College, 204; instructors and lecturers in the college of pharmacy, 19; instructors in extension and home study, not included above, 489; instructors in summer session, not included above, 467; officers of administration, 65.

Among the professional appointees for the year 1932-33 were: George William Bachman, director of the school of tropical medicine; Lucy M. Crissey, assistant to the dean of the faculty of library service; Louise Hoyt Gregory, associate dean of Barnard College; Roswell Cheney McCrea, dean of the faculty of business; Wendell W. Phillips, assistant chaplain; Arthur F. Coca, medicine; Carney Landis, psychology. The visiting professors appointed for the year 1932-33 were: Georges Ascoli, the Sorbonne; Herbert J. C. Grierson, University of Edinburgh; Paul Hazard, Collège de France; Fritz Strich, University of Berne.

Among the important events of the year was the observance on March 1 of the one hundredth anniversary of the death of Goethe, distinguished by the presence of Gerhart Hauptmann who delivered the chief address. In May Mrs. Alice Pleasance Hargreaves, the original Alice in Wonderland, was the university's guest at its celebration of the one hundredth anniversary of the birth of Lewis Carroll (Charles Lutwidge Dodgson). There was celebrated at a dinner on February 11 the triple anniversaries of the birth, graduation, and inauguration of the twelfth president of Columbia University, Nicholas Murray Butler. The Institute of Educational Research, established by the trustees of Teachers College, observed its tenth anniversary. There was transferred to New York University, on recommendation of the medical faculty, the ear, nose, and throat service at Bellevue Hospital, heretofore conducted by Columbia University, and there was established at the medical school the Valentine Mott professorship in honor of the distinguished service of Dr. Mott. Important changes were made in the entrance requirements of the medical school and of the school of journalism. A new form of certification was adopted for librarians. Important discoveries in chromium plating and electroplating were made by Prof. Colin G. Fink. There were established the Kellett Fellowships for graduate study in the humanities at either Oxford or Cambridge Universities.

The capital endowment in 1932, excluding value of plant (including Barnard College, Teachers College, college of pharmacy, St. Stephen's College, and the New York Post-Graduate Medical School), was \$86,113,328; the estimated total resources as of June 30, 1932, were \$151,114,541; the annual budget for 1932-33 was \$17,006,566.

During 1931-32 the university received gifts in money representing a total of \$2,873,182. The chief additions to special endowments were \$528,500 from Edward S. Harkness toward the construction and equipment of South Hall, \$475,000 from Edward S. Harkness toward the construction and equipment of Bard Hall, \$183,250 from the estate of Euretta Jane Schlegel for the

Kellett Fellowship Fund, \$173,880 from the estate of Lizzie Dennett Lockwood for the Dennett Scholarship Fund, \$87,000 from the estate of Henry R. Seager for the Seager Endowment Fund, \$62,200 from the estate of Harriet S. Phillips for the Phillips Fund for Barnard College, \$50,000 from the estate of Dwight W. Morrow for the Morrow Fund for the School of Law, and substantial gifts from many donors for various research projects. Gifts to income totaled \$1,198,797. The library contained 1,358,359 volumes. President, Nicholas Murray Butler, Ph.D., Hon. D., LL.D., Litt.D.

**COLVOCORESSES, REAR ADMIRAL GEORGE PARTRIDGE**, U. S. N., RET. An American naval officer, died in Litchfield, Conn., Sept. 11, 1932. He was born in Norwich, Vt., Apr. 3, 1847. After serving two years during the Civil War on the ships *Supply* and *Saratoga* he attended the U. S. Naval Academy, from which he was graduated in 1869. Commissioned an ensign in the Navy in 1870, he was promoted through the various grades, becoming lieutenant commander in 1897, commander in 1900, and captain in 1905. He retired as rear admiral in 1907. During the Spanish-American War he was executive officer of the cruiser *Concord*, a unit of Admiral Dewey's squadron, and took part in the battle of Manila Bay, being advanced five numbers in grade "for eminent and conspicuous conduct." He was instructor at the U. S. Naval Academy during 1886-90 and again during 1893-96, and was commandant of midshipmen during 1905-07. He served also as commander of the U.S.S. *Lancaster*, *Yankee*, and *Newark* and of the Naval Station at Key West, Fla.

**COMETS.** See **ASTRONOMY**.

**COMFORT, WILL LEVINGTON.** An American novelist, died in Los Angeles, Calif., Nov. 2, 1932. He was born in Kalamazoo, Mich., Jan. 17, 1878, and attended Albion (Mich.) College. After serving with the 5th U. S. Cavalry during the Spanish-American War he became war correspondent in the Philippines and China for the Detroit *Journal Newspaper Syndicate* and, in 1904, in Japan and Russia for the Pittsburgh *Dispatch Newspaper Syndicate*. His outstanding novel was *Routledge Rides Alone* (1910), in which he gave such a realistic portrayal of the horrors of war that it was used for propaganda purposes by peace societies. In addition to numerous short stories in magazines he wrote *Fate Knocks at the Door* (1912); *Down among Men* (1913); *Midstream* (autobiographical, 1914); *Red Fleece* (1915); *Lot & Company* (1915); *Child and Country* (1916); *The Hive* (1918); *The Shielding Wing* (1918); *Son of Power* (1920); *This Man's World* (1921); *The Public Square* (1923); *Somewhere South in Sonora* (1925); *Samadhi* (1927); and *Apache* (1931).

**COMMISSION PLAN.** See **MUNICIPAL GOVERNMENT**.

**COMMODITY PRICES.** See **BUSINESS REVIEW; FINANCIAL REVIEW**.

**COMMONWEALTH FUND.** See **UNIVERSITIES AND COLLEGES**.

**COMMUNISM.** More than three years of unparalleled world depression had produced up to the end of 1932 no important growth of the Communist movement in any of the leading capitalist nations except Germany. In Germany, the voting strength of the Communist party rose to 5,973,000

out of 35,410,000 ballots cast in the Reichstag elections of Nov. 6, 1932, from 4,587,000 in the 1930 elections and 3,263,000 in those of 1928. At the beginning of 1933, Germany was the focal point of the developing world struggle between capitalism and socialism, with the outcome primarily dependent upon the future course of the Fascist movement under Adolf Hitler. If Hitler gained supreme power in the Reich, it was regarded as certain that he would enter upon a life and death struggle with German communism, which might threaten the existence of the Bolshevik régime in the Soviet Union itself. On the other hand, Communists welcomed the signs of schism within Hitler's ranks, believing that the radical wing of the Nazis would eventually join forces with them.

Confronted by the danger of a new anti-Soviet campaign, headed by Hitler in Germany, and facing widespread peasant discontent at home, the Russian Communist party broke into open dissension over the policies of Josef Stalin, its dominant figure. The campaign against Stalin assumed a world-wide aspect, partly through the efforts of Leon Trotsky to unite all former Communist opposition groups under his banner. From his place of exile at Prinkipo, near Istanbul, Turkey, Trotsky attacked the foreign and domestic policies of Stalin. He asserted that the fate of the Soviet régime was dependent upon a world Communist revolution, a thesis rejected by Stalin. Trotsky urged a union of Social-Democrats and Communists in Germany to fight Fascism. Stalin followed a "hands-off" policy, curbing the international revolutionary activities of the Third International in view of necessity for peace and for foreign technical and financial aid in laying the foundations of a socialist state in Russia.

Within the Russian Communist party, both Right and Left wings united in demanding the ousting of Stalin. In September, according to the *New York Times* of Oct. 13, 1932, 18 dissident leaders sent a memorandum to the Central Executive Committee of the party, assailing his policies. The memorandum charged Stalin with responsibility for the alleged failure of the Five-Year Plan and for the establishment of a personal dictatorship in the Soviet Union. He was accused of silencing the Third International and of robbing that organization of its leadership of revolutionary masses throughout the world.

The so-called "new opposition" to Stalin was crushed with the same efficiency as had been former combinations against him. On October 11, the party expelled 20 oppositionists, including Gregory Zinoviev, Leo Kamenev, Nicolay Uglanov, as "traitors" and counter-revolutionaries. A month later, the Stalin adherents took steps to eliminate complaints regarding breakdowns in grain collections, sowing, and other items in the Five-Year Plan by purging the Communist party in the North Caucasus region. On December 20, it was announced that the party cleansing would be extended to the entire Union early in 1933. Of more than 3,000,000, members of the party, it was expected that between 30 and 50 per cent would be eliminated as waverers and backsliders. There was no change in Stalin's international policy. Shortly before the anniversary of the Bolshevik revolution (November 7), the official party organ *Pravda* reiterated the doctrine that a successful Soviet state could be established in Russia, regardless of what happened abroad.

In pursuance of this policy, the Soviet Government resumed diplomatic relations with the Nationalist Government of China, which was seeking to crush a semi-communistic peasant revolt by wholesale executions and extensive military campaigns. Moscow not only followed an unprovocative policy toward the governments of Germany and of Spain, but according to Trotsky's followers restrained German Communists from precipitating a revolutionary uprising (see *UNION OF SOVIET SOCIALIST REPUBLICS under History*).

THE THIRD INTERNATIONAL. Despite the restraint placed upon it, the Third International (Comintern) continued its activities in various parts of the world where vital Soviet interests were not likely to be imperiled. Its agents were reported active in various countries in Latin America, in Central and Eastern Europe, in various Asiatic colonies, and in the Belgian Congo, where Communist propaganda stirred the natives to a point requiring repressive action by government forces. A resolution of the executive committee of the Comintern, voted early in September, declared that revolution was imminent in Germany, Poland, and Spain. Its instructions to the Communist party in the United States were quoted in the *New York Times* (October 12) as follows.

"Mobilize the masses in a struggle for social insurance, for immediate aid for the unemployed, against wage cuts, for help for the ruined farmers, for equal rights for Negroes and for self-determination in the black belt, and for protection of the Chinese people and the Soviet Union."

Documents captured in anti-Communist raids in such widely separated points as Hungary, China, Japan, Bulgaria, Finland, and Cuba were presented as evidence of the direct link between Communist activities there and the Red International at Moscow.

COMMUNISM IN THE UNITED STATES. The vote cast for William Z. Foster, twice candidate of the Workers' (Communist) party for President, increased from 48,770 in 1928 to 102,785 in 1932. Almost half of the total 1932 vote was cast in the cities of New York and Chicago, the count by States showing 27,956 votes cast in New York and 15,582 in Illinois. Other State votes included: Michigan (9318), Ohio (7231), Minnesota (6101), Pennsylvania (5658), and Massachusetts (4821). (See *SOCIALISM*.) The party platform, adopted at the national convention in Chicago on May 29, contained the same appeals to "the industrial workers, the persecuted Negroes, and the toiling farmers," as were embodied in the instructions of the Third International, quoted above. Mr. Foster, after traveling some 17,000 miles and making over 70 speeches in various parts of the country, ended his campaign tour on September 15 on grounds of ill health. In some quarters his withdrawal was attributed to orders from Moscow, which was eager for the resumption of diplomatic relations with the United States.

Despite its lack of popular support, communism was much in the public eye during 1932. Attorney General Mitchell, in his report of September 9 on the activities of the so-called bonus army ejected from Washington by Federal troops, said: "There is irrefutable proof that a very large body of Communists and radicals, some ex-service men and some not, were in the city as part of the bonus army, circulating

among them and working diligently to incite them to disorder." This charge had been made by President Hoover on July 28 and the Communist party on July 30 claimed responsibility for the disorders in the capital. However, Maj. Pelham D. Glassford, Superintendent of the Washington Metropolitan Police, replied to Attorney General Mitchell on September 12 that the largest group of bonus advocates mustered in Washington under Communist leadership was 210.

Communists in the United States and other countries achieved notoriety also through their agitation against the death sentences passed on seven Negro youths at Scottsboro, Ala., following their conviction on charges of assaulting two white girls. The U. S. Supreme Court at Washington on November 7 ordered a new trial for the prisoners, while Communist demonstrators outside were dispersed by the police. "Hunger marchers" from various parts of the country arrived in Washington early in December under Communist leadership. Kept under strict supervision by the Washington police, they were forced to leave the city after a committee had presented demands for federal relief to Speaker Garner of the House and Vice-President Curtis, as presiding officer of the Senate.

In a number of the larger cities, Communists led rent strikes and anti-eviction demonstrations, organized demonstrations for unemployment relief, and were charged with fomenting bank runs. They protested before the Japanese embassy in Washington against Japanese aggression in China (March 26). Many of these demonstrations led to clashes with the police. Eight rioters were wounded by police machine-gun fire during a disturbance at Melrose Park, Ill., on May 6. In St. Louis, four demonstrators were shot and many injured on July 11. On February 1 at Tampa, Fla., court imposed jail sentences aggregating 53 years on 14 persons, including two women. They were convicted in connection with the shooting of one policeman and the beating of others during a Communist demonstration in November, 1931. The U. S. Circuit Court of Appeals at Chicago on October 19 ruled that membership in the Communist party or any of its affiliated organizations was sufficient grounds for the deportation of an alien. Many such aliens were deported during the year. During the presidential campaign, Mr. Foster was arrested at Los Angeles, Calif., and in Massachusetts for attempting to speak.

In June, 1932, the Amana Community, one of the most successful groups of religious communists in the United States, voted to abandon some of its communistic practices and to organize for pecuniary profit under a stock corporation plan. The group of some 1300 persons, occupying seven villages in Iowa, was established in 1855 by German Protestant Christians.

COMMUNISM IN EUROPE. In the countries of Northwestern Europe, Communism made slight gains during 1932. In France, the parliamentary elections of May returned 19 Communists to the Chamber of Deputies, which has 615 members, as compared with 12 in the 1928 elections. However, 9 of the Communist Deputies elected in 1932 represented the Unité Ouvrière, a dissident Communist group, while 10 were members of the orthodox group affiliated with the Third International. In Britain, where the Communists secured but 75,000 votes and no seats in the 1931 general election, they played a leading rôle in

several "hunger marches" and the demonstrations of the unemployed in London toward the end of 1932 (see GREAT BRITAIN under *History*). W. A. L. Hannington, leader of a contingent of "hunger marchers," was sentenced to three months in prison on November 8 on a charge of inciting to mutiny. In the British municipal elections of November 2, the Communists failed to win a single seat, although entering candidates in many boroughs. In Belgium, many Communists were arrested during July while leading a large-scale strike of coal miners (see BELGIUM under *History*).

The Netherland Communist party was reported to have made considerable gains and clashes between Communists and newly organized Fascist groups were becoming more frequent toward the end of the year (see NETHERLANDS, THE, under *History*). In Finland, Spain, and some of the countries of Eastern and Central Europe, where Communism appeared to be making more important gains, it was repressed with greater severity. Several hundred Communists were arrested in Finland and many were convicted of treason. The Finnish Communist party was outlawed in 1931 (see FINLAND under *History*). The Spanish Republican government shipped 109 Communist leaders from Barcelona to exile in Spanish Guinea on February 10 for their part in a Communist insurrection. Nevertheless, Communist strikes and disorders occurred in various parts of the country during the remainder of the year (see SPAIN under *History*).

At the close of 1932 Bulgaria appeared on the verge of a Fascist dictatorship, as a result of striking Communist gains at the municipal elections of October, the intransigence of the Communist deputies in Parliament, and the widespread unrest among the peasants (see BULGARIA under *History*). In Hungary, E. Sallay and A. Fuerst, alleged agents of the Third International, were executed on July 29, following their arrest in a raid on the secret Communist headquarters in Budapest. On January 23, an Italian court sentenced 8 Communist organizers to serve from 3 to 17 years in prison. There were clashes between Greek student Communists and the police in December and all Communist papers in Athens were confiscated.

COMMUNISM IN THE FAR EAST In the Far East, the Communist movement was making greatest headway in Central China. The Lytton Report described Communism as "an actual rival of the National Government," possessing "its own law, army, and government, and its own territorial sphere of action." It reported that Communist governments had been established in Kiangsi and Fukien Provinces and that large parts of many other Provinces were completely sovietized. Shanghai remained a centre of Communist propaganda, despite the government's severe measures. Chinese authorities arrested a number of prominent Communists there during the year, including Chen Tu-hsiu, Secretary General of the Chinese Communist party. For the third successive year, Nationalist armies campaigned against the Communists with but indifferent success. In September, Dr. Hu Shih, China's foremost philosopher, warned the Government that China faced complete chaos unless it recognized the redistribution of land made in provinces under Communist control and made provision for a similar redistribution in other areas (see CHINA under *History*).

The extent of the Communist movement in Japan was revealed during the trial of 199 Communists arrested by the police in 1928 and 1929. On October 29, the court sentenced 17 of them to terms of from nine years to life. The trial judge declared a connection between the movement in Japan and the Third International had been established. In the Philippines, the Supreme Court upheld sentences imposed on 30 alleged Communists for sedition. The Communist-controlled régime in Outer Mongolia (see MONGOLIA) was reported by unconfirmed Japanese sources late in 1932 to have been overthrown. (See JAPAN under *History*.)

COMMUNISM IN LATIN AMERICA. Most of the Latin American nations during 1932 were in a state of active social ferment favorable to the spread of radical doctrines. Authorities disagreed as to the actual strength of the Communist movement. Government officials habitually pinned the Communist label upon all their opponents. On the other hand, the Committee on Inter-American Relations, New York, in cooperation with the National Foreign Trade Council, on Sept. 6, 1932, issued a report asserting that there was no evidence of any organized Communist or radical Socialist movement in Latin America. However, there appeared to be authoritative evidence of Communist leadership in the insurrection in Salvador in January, which was put down by the government after severe fighting (see SALVADOR, EL, under *History*). In Chile, the Communist movement headed by Col. Marmaduke Grove played a leading rôle in the political disorders of the year. The growing possibility of the establishment of a Communist government induced the Conservative elements to support their former radical but non-Communist opponent, Arturo Alessandri, in the Presidential election of October 30 (see CHILE under *History*).

In Argentina and Uruguay also, there were indications of authentic Communist movements. The Argentine Government in February deported 140 Communists to Europe. Deportations and arrests failed to eradicate Communist propaganda. In July, it was reported that harvesting in the Province of Santa Fé had been paralyzed by Communist agitators. In Uruguay in February there was an active Communist campaign, accompanied by several abortive risings in the northern districts. On February 8, President Terra asked the National Administrative Council for extraordinary powers to cope with the alleged Communist plots. On March 6, the Chief of Police of Asunción, Paraguay, announced that a Communist project to make the city headquarters for South America had been frustrated by the deportation of Brazilian and Chilean radicals.

The Government of Sánchez Cerro in Peru continued to deport radicals and "Communists" to unhealthy tropical jungles. In May, it proposed a conference of the South American governments to make common cause against Communist agitators. While coolly received in Argentina, the proposal won the support of leading Chilean newspapers. In Bolivia, radical agitation among Indians and peons led Congress in January to enact a social defense bill granting the government large powers to check "Communist" propaganda. In Ecuador, where Communists elected two members of Congress, and in Bolivia a number of Indian outbreaks and raids were attributed to Communist agitation.

The Mexican Government on May 30 ordered

the cessation of Communist activities in three States; on August 30, it sentenced 51 alleged Communists to a penal island. The Guatemalan Government on February 20 executed J. P. Wainwright, who was accused of participating in a Communist plot against it. See UNEMPLOYMENT; COSTA RICA under *History*.

**CONGO, BELGIAN.** A Belgian colony in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. Area, estimated at 918,000 square miles; the native (Bantu) population in 1930 was 9,584,936. On Jan. 1, 1930, the white population numbered 25,679, including 17,676 Belgians, 1008 English, 1582 Portuguese, 1490 Italians, 544 Americans, and 717 French. The chief city and former capital is Boma; by a royal decree of 1923, the capital was transferred to Leopoldville (population, 39,330). Other important towns are Elizabethville (25,595), Stanleyville, and Coquilhatville. The elementary schools were attended by about 254,035 children in 1931.

Primitive agriculture is developing under government supervision. Palm nuts, palm oil, white copal (resin), rubber, coffee, and cacao are the principal products. Cattle thrive in the highlands of Katanga, Ituri, and Kivu. The Katanga district is also one of the world's most important sources of copper, the production in 1930 reaching 146,700 tons. Gold, diamonds, radium, cobalt, coal, and tin also are mined and iron, platinum, palladium, vanadium, zinc, and bauxite are known to exist. Important helium supplies were discovered in 1930. Imports in 1930 were valued at 1,581,000,000 francs (1,943,000,000 francs in 1929) and exports at 1,512,000,000 francs (1,444,000,000 francs in 1929). One Belgian franc equals \$0.0278 U. S. Due to the fall in prices of colonial products, the 1930 budget showed a final deficit equivalent to \$2,000,000. Estimated revenues and expenses were 690,810,000 and 690,732,121 francs, respectively.

**COMMUNICATIONS.** The 335-mile railway to link up the Benguela Railway at Luao with the Katanga Railways at Tenke was opened July 1, 1931. In 1931, railways in the Belgian Congo extended 2422 miles, highways 21,180 miles, telegraph lines, 4190 miles, telephone lines, 4000 miles. Steamers provide means of transport along the navigable stretches of the Congo and its branches. Steamships numbering 584 with a tonnage of 2,154,633 entered the three ports—Boma, Banana, Matadi—and 558, with a tonnage of 2,166,019, cleared in 1930. The chief administrative centres are connected by air lines. A Belgian air company was scheduled to open a service between Antwerp, Brussels, and the Congo, to start on Oct. 1, 1932.

**GOVERNMENT.** A governor-general and several vice governor-generals administered the colony on behalf of the Belgian King and the budget is voted by the lower house of the Belgian Parliament. The colony is divided into four Provinces which are in turn divided into 22 administrative districts. There is a military force of 14,300 natives officered by 431 Europeans and a territorial police of 5800 men. Governor-General in 1932, Lieutenant-General Tilkens, appointed in 1927.

**RUANDA-URUNDI.** The districts of Ruanda and Urundi, formerly in German East Africa, were turned over to Belgium as mandatory of the League of Nations and in 1925 were united administratively with the Belgian Congo. Area about 20,550 square miles; the capital is Usumbura.

**CONGO FREE STATE.** See CONGO, BELGIAN.

**CONGREGATIONAL AND CHRISTIAN CHURCHES.** THE GENERAL COUNCIL OF THE. The General Council of the Congregational and Christian Churches was instituted at Seattle, Wash., June 26, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The formal existence of the former organizations, however, was continued for the time being against possible legal necessities. The general council was to carry on the administrative affairs of the united churches but with no ecclesiastical authority, as the plan of union provides for local autonomy in the individual church and in groups of churches associated together. Its next biennial meeting was to be held in Cleveland, Ohio, May 24-31, 1933.

Congregationalism was founded in the United States by the Pilgrims in Plymouth, Mass., in 1620 under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency and, as a result, the essential elements of Separatism and Puritanism were combined in Congregationalism. In this denomination each church holds the right to frame its own statement of belief, and the policy of the denomination as a whole, represents adaptation to conditions rather than accord with a theory of church government.

The Christian Church originated in three religious movements: that of the Rev. James O'Kelly of Virginia, who in 1792 withdrew from the Methodist Episcopal Church; that of Abner Jones, who, withdrawing from the Baptist denomination, organized a separate church in Lyndon, Vt., in 1801; and that of a group of Kentucky Presbyterian ministers who formed a new denomination in 1804. These groups eventually united, all holding that minor differences in opinion should be subordinated to Christian brotherhood.

Statistics for the Congregational and Christian churches as of Jan. 1, 1932, showed 6434 churches, 5946 ministers, and a church membership of 1,048,205. There were 3498 young people's societies, with a membership of 179,267. The Sunday school enrollment was 784,730. The total raised for all benevolences was \$3,457,433, and the home expenses of the churches were \$19,195,468.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary

society in the United States, having been organized June 29, 1810. On Jan. 1, 1932, there were 17 missions under 12 different flags; the stations connected with these missions numbered 97 and the outstations 1916. The missionaries holding life appointments numbered 623 and included 142 ordained men, 73 unordained men, 205 wives, and 203 single women. There were also 71 associates serving for shorter periods, bringing the total number of missionaries up to 694, while native workers numbered 5317. Religious services were conducted in 2078 places. The organized churches numbered 705, with 101,959 communicants. The total church constituency numbered 297,398; Sunday schools, 1297; theological seminaries and training schools, 29, with an attendance of 1634 students; colleges, 10, with 3797 students; secondary schools, 75, and primary and elementary schools, 1347, with a total enrollment of 88,640. There were 32 hospitals and 57 dispensaries, with a staff of 44 physicians and 30 foreign nurses. Total expenditures of the board for the year ending Aug. 31, 1932, were \$1,851,938.

Another tested agency is the American Missionary Association, which began its major work following the Civil War in the field of education among Negroes, opening such schools as Hampton Institute, Atlanta, and Fisk Universities, and Talladega, Straight, Tougaloo, and Tillotson Colleges, some of which have since become independent. In similar ways, through school and church, it has served the mountaineers of the South, the Indians of the West and Southwest, and the Puerto Ricans. In 1931 the association reported direct connections with 23 schools and colleges, enrolling 5151 students, and 221 churches with 9893 members. Expenditures for the same year were \$1,110,609. The association holds properties and trust funds amounting to \$14,000,000.

A wide range of home missionary activities is carried on by the Congregational Church Extension Boards, including the Congregational Home Missionary Society, the Congregational Church Building Society, and the Congregational Sunday School Extension Society. They organize churches, establish church schools, aid needy congregations in the support of their ministers, give specialized service to foreign-speaking groups and to Negroes in the North, and assist in church and parsonage building. The more strictly home missionary service covers two-thirds of the territory of the United States, containing one-third of its population. In the remainder of the country similar work is done by independent State conferences. In 1931 these societies helped to maintain 643 churches and preaching stations, having a total membership of 33,945, and received 3193 persons into church membership. There were enrolled 485 workers, including students employed for short-term summer service. Expenditures for church and parsonage aid amounted to \$392,504; total expenditures, including payments from revolving funds, amounted to \$936,241.

Comprising the Congregational pension boards are three societies: the Congregational Board of Ministerial Relief; the Annuity Fund for Congregational Ministers; and the Retirement Fund for Lay Workers. The Congregational Board of Ministerial Relief, which makes free grants to needy aged and disabled Congregational ministers, disburses annually approximately \$250,000. The Annuity Fund for Congregational Ministers,

endowed by the Pilgrim Memorial Fund of \$5,000,000, disburses to its 2665 members approximately \$300,000 in annuities. The Retirement Fund for Lay Workers is a plan under which lay workers in Congregational organizations may provide retirement annuities for themselves with the aid of their employing agencies.

Among the theological seminaries with which the Congregational and Christian denominations are affiliated are the Chicago Theological Seminary, Divinity School of Yale University, Hartford Seminary, Oberlin Graduate School of Theology, Atlanta Theological Seminary Foundation (Nashville, Tenn.), Union Theological College (Chicago), and the Pacific School of Religion. In addition there are 41 colleges which have had some historical relation to Congregationalism, although a number of them are now undenominational. The Christian denomination has affiliation with Elon and Defiance Colleges.

The accompanying table, reprinted from the *Congregational Year Book*, 1931, gives statistics of international Congregationalism:

INTERNATIONAL CONGREGATIONALISM

Countries	Churches, Chapels, and Stations	Members of Churches	Members of Sunday Schools

\* Includes reports of London Missionary Society and American Board.

<sup>b</sup> United Church. Comprises the former Presbyterian, Methodist, and Congregational churches.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City, with a regional office in the Christian Publishing Association Building in Dayton, Ohio. The Congregational Publishing Society maintains branches at 14 Beacon Street, Boston, and at 418 South Market Street, Chicago. The officers of the general council for 1931-1933 were: moderators, the Rev. Carl S. Patton, Los Angeles, Calif., and the Rev. Frank G. Coffin, Columbus, Ohio; secretary, the Rev. Charles E. Burton, New York City; associate secretary, the Rev. Frederick L. Fagley, New York City; assistant secretary, the Rev. Warren H. Denison, Dayton, Ohio; treasurer, William T. Boulton, New York City.

**CONGRESS, UNITED STATES.** See UNITED STATES.

**CONNECTICUT. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 1,606,903, as against 1,380,631 in 1920. Hartford, the capital, had (1930) 164,072 inhabitants.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops for 1932 and 1931:

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. Bu.</i>	<i>Value</i>
Hay .....	1932	253,000	313,000 <sup>a</sup>	\$5,171,000
	1931	254,000	327,000 <sup>a</sup>	5,535,000

Apples ....	1931	.....	615,000	787,000

<sup>a</sup> Tons. <sup>b</sup> Pounds.

**MINERAL PRODUCTION.** The State's production of minerals, normally secondary among its industries, was diminished in virtually all branches in 1930, the latest year for which the tables of the Federal Bureau of Mines were available. The most considerable item of the mineral total, production of stone, fell to 2,436,520 short tons, sandstone included, for 1930, from 2,621,260 short tons, sandstone not included, for 1929; and in value, to \$3,187,815 for the above total of 1930, from \$3,490,520 for that of 1929. The clay products of 1930, pottery included, attained the value of \$1,547,524, as against a total of \$2,038,539, excluding pottery, for 1929. Sand and gravel were produced to the value of \$446,973 (1930); lime, to the value of \$282,521 (1930), was the only other native mineral to yield a total of any importance. A considerable production of coke from coal brought into the State furnished a great part of the total of \$2,803,576 representing miscellaneous mineral production of 1930. The total value of the mineral production of the State was \$5,485,120 for 1930; for 1929, \$7,053,468.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$22,525,600 (of which \$1,681,858 was for local education); for interest on debt, \$656,865; for permanent improvements, \$15,685,042; total, \$38,879,037 (of which \$13,569,468 was for highways, \$2,887,978 being for maintenance and \$10,681,490 for construction). Revenues were \$41,919,003. Of these, property and special taxes furnished 27.8 per cent; departmental earnings and compensation to the State for officers' services, 6.3; sale of licenses, 53.2 (in which was included a gasoline sale tax that produced \$4,464,119). Funded debt outstanding on June 30, 1931, totaled \$16,291,100. Net of sinking-fund assets, the debt was \$605,387. On an assessed valuation of \$3,150,407,629 the State levied in the year ad-valorem taxes of \$1,677,159.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 973.37.

**EDUCATION.** In the face of economic adversity the educational and financial groups concerned with the public schools were reported to have maintained general harmony and persistent effort to keep up the schools' standards during the year. The number of persons of school age in the State, as reported at the end of 1932, was 374,735. There were enrolled in the public schools, in the

academic year 1931-1932, 321,732 pupils. Of these, 241,719 were in common schools or elementary grades; in junior high schools, 17,036; in other high schools, 62,977. The year's expenditures for public-school education totaled \$35,416,117. Yearly salaries of teachers averaged \$1611 for elementary positions, \$1937 in junior high schools, and \$2216 in other high schools.

**CHARITIES AND CORRECTIONS.** Under the system in force in 1932 the institutions maintained by the State for the care and custody of persons were managed by appointed boards and were supervised by the Department of Public Welfare. This department was composed of a board of five five-year appointees and of two executive heads. Of the latter, one was secretary of the department (William W. T. Squire) and had direct charge of a bureau of adult welfare; the other was commissioner of the bureau of child welfare. There were eight major State institutions concerned with welfare. The State contained also 10 private hospitals for mental cases, 10 county jails, 54 almshouses, 33 State-aided hospitals, and 42 homes for the aged. State institutions, with their populations of June 30, 1932, were: Connecticut State Prison, at Wethersfield, and prison farm, 655 and 83 respectively; State Farm for Women (prisoners), Niantic, 225; Connecticut School for Girls, Middletown, 252; Connecticut School for Boys, Meriden, 350; Connecticut Reformatory, Cheshire, 444; Connecticut State Hospital, Middletown, 3312; Norwich State Hospital, Norwich, 2700; Mansfield State Training School and Hospital (epileptics and the feeble-minded), 1070; Mystic Oral School (for the deaf), Mystic, 121.

**ELECTIONS.** The popular vote of November 8 gave a slight plurality for the Republican National ticket. The Hoover (Rep.) vote was 287,720; the Roosevelt (Dem.) vote, 281,193. For United States Senator, Augustus Lonergan, Democrat, of Hartford, defeated Senator Hiram Bingham, Republican, running for reelection. Wilbur L. Cross, Democrat, was reelected Governor, defeating ex-Governor John H. Trumbull, Republican. The lower branch of the General Assembly remained Republican, but the Democrats elected a majority of one in the upper house. To the Federal House of Representatives were elected 2 Democrats and 4 Republicans, of whom one (Rep.) was elected as Representative-at-Large; the pluralities of two of the Republicans were trifling, however, and uncertain to stand in case of contest. A referred proposal that the General Assembly petition Congress to repeal the Eighteenth Amendment was approved by popular vote.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, Wilbur L. Cross; Lieutenant-Governor, Samuel R. Spencer; Secretary of State, William L. Higgins; Treasurer, Roy C. Wilcox; Comptroller, F. M. Salmon; Attorney-General, Warren B. Burrows.

**Supreme Court of Errors:** Chief Justice, W. M. Maltbie; Associate Judges, F. D. Haines, G. E. Hinman, John W. Banks, Christopher L. Avery.

**CONNECTICUT COLLEGE.** A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut. The enrollment for the autumn of 1932 was 583. The faculty numbered 65 members. The productive funds amounted to \$1,305,659 and the budget for the year, not including building operations, was more

than \$539,651. There were 48,916 volumes in the library. In 1931 the college received approximately \$36,000 in miscellaneous gifts. President, Katharine Blunt, Ph.D.

**CONSERVATION.** See FORESTRY.

**CONSTITUTIONAL AND PUBLIC LAW.**

See LAW in 1932.

**CONSTRUCTION.** See BUILDING; ARCHITECTURE.

**CONSUMERS' SOCIETIES.** See COÖPERATION.

**CONTRACT BRIDGE.** The game of Contract Bridge soared to even greater heights in 1932, much of its popularity, of course, being due to the depression which kept people away from costly amusements and sent them to the bridge table in droves. More newspaper bridge columns, syndicated and unsyndicated, written by experts and non-experts alike, theses, books, and pamphlets appeared. And as usual numerous tournaments were held. No official ranking of the bridge players of the world is ever made, but at the end of the year it became apparent that Hal Sims of New York had the greatest following. This was due to his amazing continued success in tournament play and to the widespread circulation of his book "Money Contract" which appeared during the year. Sims won three important tournaments in 1932, taking first place with Willard Karn in the national pairs tournament in the winter, and then winning the Vanderbilt Cup in the fall with his team composed of himself, Karn, Vladimir Von Zedtwitz, and Harold S. Vanderbilt, donor of the cup. With Sidney Burnstine, Karn, and Howard Schenken he won the Eastern fours championship in February. That was after the famous "Four Horsemen" team had been dismembered when Oswald Jacoby had been ousted to make way for Schenken.

Jacoby was on the Crockford's Club team of four that took the American Bridge League championship at Atlantic City in the summer when he played with Louis Watson, Theodore Lightner, and Michael Gottlieb. The Knickerbocker Whist Club four won the winter championship. This team was composed of George Reith, B. J. Becker, Von Zedtwitz, and S. G. Churchill. Sidney Lenz, whose long drawn out battle with Ely Culbertson, stretching over the latter part of 1931 and the early weeks of 1932, marked the height of bridge ballyhoo, won the Eastern and the Goldman pairs championships, two of the most valued honors. His partner in each case was Com. Winfield Liggett, Jr.

The contract bridge rules were changed and recoded in the fall and were promulgated November 1, for immediate adoption. In these new rules there was a general simplification of the playing code and a distinct merging of the English and American rules. The no trump count was changed so that now over tricks are valued as follows: each odd trick thirty points and each even trick forty. There was also a slight raising of the non-vulnerable double penalties and a consequent lowering of vulnerable double penalties.

**COOLIDGE, CALVIN.** See RAILWAYS; UNITED STATES under National Election.

**COÖPERATION.** A study made by the Federal Bureau of Labor Statistics of the advance of the cooperative movement throughout the world indicated that in the thirty-seven countries surveyed there existed more than 400,000 societies of all types. Of these 37 per cent were credit societies, 35 per cent were agricultural societies,

and 10 per cent were consumers' societies. Membership figures were available for twenty-one countries and these showed that there were some 70,000,000 persons who were members of one kind or another of the cooperative groups. Almost 5,000,000 of the coöperators belong to the consumers' organizations. In twenty-four countries for which data were available the consumers' societies did an annual business of nearly \$11,000,000,000, four-fifths of which was done by the Russian organizations.

At this point it may be indicated that in Soviet Russia membership in a consumers' society is practically compulsory in that in many places the coöperative store is actually the only distributing agency existing for food supplies, clothing and other family wants. If Russia is excluded, the largest coöperative activity was to be found in Great Britain where the consumers' organizations did \$952,000,000 worth of business in 1931. The sales of coöperative wholesale societies in twenty-three countries in 1931 totaled nearly \$900,000,000. As readers of these columns are aware, many consumers' societies through their wholesale branches engage in manufacturing activities; the value of products coöperatively made in 1931 in the seven countries of Finland, Germany, England, Norway, Poland, Scotland and Sweden amounted to \$187,000,000. Table I on page 209 shows the distribution of the coöperative societies in the thirty-seven countries covered by the Bureau of Labor Statistics' study.

Membership in the more important nations in which cooperation is a significant activity was as follows for the years indicated: Soviet Russia (1930), 59,414,300; Great Britain (1930), 6,702,277; India (1929-30), 4,176,675; United States (1929), 3,553,954; France (1930), 2,305,946; Czechoslovakia (1929), 2,220,509; Italy (1930), 1,817,248; Rumania (1930), 1,579,089; Denmark (1929), 1,383,971. The consumers' cooperative movement is particularly strong in Czechoslovakia, Finland, France, Great Britain, Italy and Soviet Russia. It is interesting to note the relation of consumers' coöperation in proportion to the population in various countries. In Czechoslovakia the percentage of the total population belonging to consumers' societies was 63.56; in Soviet Russia 42.86 per cent of the total population of the country belonged to consumers' societies; in Great Britain the percentage was 14.79; in Finland it was 13.13 per cent; in Switzerland it was 9.84 per cent; in Denmark it was 9.34 per cent; in Hungary it was 8.32 per cent; in Iceland it was 7.43 per cent; in Sweden it was 7.84 per cent. The smallest degree of development was found in Canada, Portugal, South Africa, United States, and Yugoslavia, in which less than 1 per cent of the population belonged to consumers' cooperative societies. As has been pointed out, the societies surveyed did nearly an annual business of \$11,000,000,000, about four-fifths of which constituted the transactions of the Russian organizations. The following figures present the activities of the more important countries for the latest years available which, in most instances, were 1930 and 1931: Russia, \$8,446,000,000; Great Britain, \$952,718,000; Denmark, \$419,948,000; Germany (societies belonging to the Central Union only), \$273,795,000; France, \$149,409,000; Belgium, \$166,484,000. The total business transacted in the United States by the

local consumers' societies in 1929 was \$64,655,000.

Table II shows the business done by the wholesales of the various countries in 1931. The combined wholesale business of all the countries studied was nearly nine-tenths of a billion dollars, with Great Britain and Germany between them accounting for more than one-half of the total. It will be noted that Belgium, Denmark, Finland, France, Sweden, and Switzerland also had sizable wholesale businesses. In some twenty countries workers were participating in producers' coöperatives which were either departments of coöperative wholesale societies or, as in the case of Belgium, made up an independent central organization. In Germany, England, Finland, and Czechoslovakia these producers' coöperatives have made considerable progress in furnishing the commodities which the consumers' organizations distribute among their membership. Apparently the manufacture of soap, shoes, flour, and candy and the fabrication of clothing and hosiery and the roasting of coffee are the industries which most frequently occur. The survey points out that England is the only country whose coöperative movement mines coal and builds motor cars. Also, the wholesale societies of England and Scotland operate, through the English and Scottish Joint Coöperative Society, large tea plantations in Ceylon and India. The following commodities are among the more important produced in the countries indicated by their consumers' coöperative organizations:

*Austria*, clothing, confectionery, edible paste, shoes, textiles, and underwear; *France*, candy, clothing, coffee roasting, eau de Cologne, fruit (canned), sardines (canned), shoes, vegetables (canned); *Norway*, bakery goods, cheese, clothing, coffee roasting, flour, leather, margarine, meat products, polish (shoe), shoes, soap, and tobacco; *Denmark*, bicycles, candy, chemicals, cigars, clothing, coffee roasting, flour, harness, hosiery, leather, margarine, mustard, paper, rope, shoes, shoes (wooden), soap, spices, tobacco, and wine; *Netherlands*, cheese, jam, and soap; *Scotland*, blankets, brushes, clothing, corn meal, flour, furniture, paper, preserves, rope and twine, shoes, soap, and tobacco; *Soviet Russia*, candy, coffee roasting, corn meal, feather down, fruit (canned), leather, meat products, molasses, nails, shoes, soap, spices, starch, tea blending, tobacco, vegetable oils, and wire; *Sweden*, chemicals, corn meal, electric-light bulbs, flour, margarine, matches, meat products, overshoes, phosphates, rubber tires, shoes, and soap; *Czechoslovakia*, bakery goods, baking powder, brooms, butter, cheese, chemicals, chicory, chocolate, coffee roasting, confectionery, cosmetics, edible paste, fish products, flour, fruit (preserved), hosiery, jam, meat products, mustard, pickles, polish (metal), polish (shoe), ribbon, sauerkraut, shoes, spices, suspenders, trousers, underwear, vanilla, vinegar, and wine (fruit); *Germany*, boxes (wooden), brushes, candy, cheese, chocolate, chemicals, cigars, clothing, coffee (malt), edible paste, fish (cured), flour, fruit (canned), furniture, lumber, matches, meat products, mustard, polish (shoe), soap, textiles, tobacco and vegetables (canned), cigars, coffee roasting, printing, sausage, and soap; *England*, bacon, bedding, bicycles, biscuits, brushes, butter, canned goods, cheese, chemicals, cigars, chocolate, clothing, coal mining, cocoa, coffee roasting, confectionery, corsets, cutlery, drugs, farming, flour, furniture, glass bottles, hardware, harness, hosiery, jewelry, lard, leather, lumber, margarine, motor cars, motor cycles, paints, picture framing, pottery, preserves, rope and twine, scales, shoes, soap, tea blending, textiles, tin plate, tobacco, trunks, bags, etc., umbrellas, underwear, vinegar, and yeast.

COÖPERATIVE LEAGUE IN 1930. The 1932 YEAR BOOK of the Coöperative League of the United States indicated that at the end of the year 1930 it had 137 societies affiliated with it with a total membership of 126,977 and total business for the year of \$18,687,782. Retail distributing societies made up the larger proportion of the total

number of affiliates, there being 116 in this group. There were also five coöperative housing organizations affiliated, four wholesale consumers' societies, five insurance societies, and seven credit and banking societies. The four wholesale societies did a combined business of \$2,800,902, the most important being the Coöperative Central Exchange whose business was \$1,767,760. The other three wholesale coöperative societies were the Grange Coöperative Wholesale, the Eastern Coöperative Wholesale and the Midland Oil Association. In 1930 the average membership of the retail affiliated societies (of which there were 107 in all) was 259 as compared with 344 in 1928. The share capital per society was \$24,574 and the average business per society was \$145,197.

COÖPERATIVE CREDIT SOCIETIES. A careful study made by the Federal Bureau of Labor Statistics reaching some twenty States, showed that in all but two of these there was a combined membership of nearly 270,000 persons in coöperative credit societies in the country in 1931. The combined share capital in nineteen States was over \$15,000,000 and the total resources amounted to more than \$33,000,000. Massachusetts, which led all the States in the union in this type of activity, showed existing 302 credit unions with 109,592 members, a share capital of \$8,363,604, and total resources of \$13,874,270. In New York there were 113 credit unions with 58,585 members, a total share capital of \$1,051,035, and combined total resources of \$9,251,835. In Illinois the figures were 92 unions, 19,423 members, a share capital of \$1,079,155, and combined total resources of \$1,198,173. Eleven States reported a total of \$19,000,000 in loans made during the year; while the loans outstanding in 19 States at the end of 1931 aggregated more than \$26,000,000. The leaders in lending operations were the following: Illinois, \$1,701,108 worth of loans made during the year and \$1,004,590 worth of loans outstanding at the end of the year; Massachusetts, \$14,526,730 in loans and \$11,043,189 in loans outstanding; New Hampshire, \$259,014 in loans and \$1,487,103 in loans outstanding; New York, total loans not reported and \$6,880,491 in loans outstanding; Rhode Island, \$585,526 in loans and \$1,791,786 in loans outstanding. It is interesting to note that between 1929 and 1931 the number of societies had increased 34.6 per cent in those States for which 1931 data were reported above. The greatest progress as regards number of societies took place in Illinois where 51 new organizations were formed; Iowa showed a gain of 26 societies, Minnesota, a gain of 32, Wisconsin, a gain of 38, and Missouri, a gain of 39. New York was the only State reporting in which there were fewer credit unions in 1931 than in 1929.

FARMERS' COÖPERATIVE ASSOCIATIONS 1930-32. According to the Federal Farm Board there existed in 1931-32, 11,900 farmers' coöperative societies in the United States which had an estimated membership of 3,200,000 and which did an estimated total business of \$1,925,000,000. It is to be noted that for the most part American agricultural coöperative activity consists of marketing operations. The table on page 211 indicates the distribution of these agricultural coöperatives by types of organization, comparing 1930-31 with 1931-32.

## ESTIMATED MEMBERSHIP AND BUSINESS OF FARMERS' COÖPERATIVE ASSOCIATIONS IN THE UNITED STATES, 1900-31 AND 1931-32

Type of organization	Number of associations		Estimated membership		Estimated business	
	1930-31	1931-32	1930-31	1931-32	1930-31	1931-32

Miscellaneous purchasing associations	1,588	1,645	392,000	533,000	215,000,000	181,000,000
Total . . . . .	11,950	11,900	3,000,000	3,200,000	2,400,000,000	1,925,000,000

BUILDING AND LOAN ASSOCIATIONS IN 1931. It was inevitable that the depression should hit the building and loan associations of the United States with the result that the figures for 1931 as compared with 1930 showed a falling off in number of societies, combined membership and total resources. The following are the comparative figures: the number of associations decreased from 11,767 in 1930 to 11,442 in 1931;

the Labor National Bank of Three Forks, Montana, closed their doors; however, the first named was able, before the end of 1932, to reorganize its affairs and once again open for business. The accompanying table shows the condition of the seven labor banks in operation as of June 30, 1932. The data were collected by the Industrial Relations Section of Princeton University.

Name and location of bank	Capital	Surplus and undivided profits	Deposits	Total resources
Telegraphers' National Bank, St. Louis, Mo. . . . .	\$500,000	\$197,486	\$5,265,238	\$6,482,523
Labor National Bank, Paterson, N. J. . . . .	300,000	163,692	4,351,018	5,708,400
Amalgamated Bank of New York, N. Y. . . . .	650,000	577	4,691,389	5,587,168
Mount Vernon Savings Bank, Washington, D. C. . . . .	400,000	157,917	3,576,986	4,356,459
Union National Bank, Newark N. J. . . . .	375,000	212,447	2,502,608	3,612,306
Amalgamated Trust & Savings Bank, Chicago, Ill. . . . .	200,000	151,277	1,989,226	2,396,892
United Labor Bank & Trust Co., Indianapolis, Ind. . . . .	112,500	22,500	286,049	421,049
Total . . . . .	2,537,500	905,896	22,662,514	28,564,797

the combined membership decreased from 12,336,754 to 11,338,701; the total resources declined from \$8,824,119,159 to \$8,417,375,005. The following figures give the total assets for a selected group of States in which the activities of building and loan associations have been significant: California, \$453,007,351; Illinois, \$466,600,631; Indiana, \$288,584,111; Maryland, \$210,000,000; Massachusetts, \$560,103,042; Michigan, \$165,269,540; Missouri, \$206,364,643; New Jersey, \$1,201,973,615; New York, \$443,252,364; Ohio, \$1,158,281,871; Pennsylvania, \$1,250,692,072; Wisconsin, \$281,233,267.

POSTAL CREDIT UNIONS IN THE UNITED STATES. These columns before have recorded the progress of the credit unions of the United States Postal Employees. Figures for 1931 showed that these credit unions increased 12.2 per cent, the membership increased 20.9 per cent, and the assets rose 52.1 per cent comparing 1931 with 1930. At the end of 1931 there were 275 societies with 49,037 members and \$5,078,874 in assets. The number of cumulative loans was 172,437 and the total amount loaned during the period of activity of these societies was \$21,042,432. The dividend rate for 1931 averaged 6.69 per cent while the total operating cost was 1.18 per cent of the loans granted.

LABOR BANKS. At the end of June 30, 1932 there were only seven labor banks in the country in operation, which marked the decrease of four banks over the preceding year. During 1931-32 the Federal Bank and Trust Company of New York City, the Labor National Bank of Jersey City, the American Bank of Toledo, and

AMALGAMATED CLOTHING WORKERS' COÖPERATIVE APARTMENTS. The Amalgamated Clothing Workers' Union in New York City in 1932 completed a new block of houses containing 115 apartments and having 426 rooms, located in the Borough of the Bronx. In 1927 and 1929 this organization erected two groups, also in the Bronx, containing 2007 rooms and providing quarters for 511 families. On the East Side in Manhattan this organization in 1930 had also built dwellings for 231 families containing 912 rooms. Thus, over the period 1927-32 the Union's housing activities had provided living quarters for 857 families. The latest venture cost \$550,000 and the buildings were equipped with mechanical refrigerators, elevator service and garbage incinerators. The tenants subscribed for stock in the building association, this amounting to \$425 per room, one-half of which was paid in cash and the remainder was to be paid over a period of five years. It is interesting to note that in the original development the Amalgamated has followed a policy of rent reductions, the average rental now being \$9.65 per room as compared with \$11 per room, the amount which was originally charged.

COÖPERATION IN GREAT BRITAIN. The figures compiled by the Chief Registrar of Friendly Societies in Great Britain showed that despite the business depression the coöperative movement in the country was indicating considerable progress in membership and working capital. While sales fell off, largely due to the fall in commodity prices, the retail consumers' societies succeeded in doing a larger gross business in

1930 than in previous years. Particularly significant was the increase in membership in the retail consumers' societies, 239,000 new members having been added in the year. London, which, according to the *Monthly Labor Review* had heretofore been considered hopeless from the point of view of consumers' coöperation, was by the end of 1931 boasting one of the largest organizations in the world. In 1925 this society had a membership of 141,236; at the end of 1931 its membership was 429,421 and its sales for the year amounted to almost \$48,000,000. In 1930 the consumers' retail societies did a total business of \$1,052,757,000; the wholesale societies did a total business of \$501,285,000; and the workers' productive societies did a total business of \$17,699,000.

**GERMAN COÖPERATIVE MOVEMENT.** Along with other business activity in Germany the coöperative movement apparently has been suffering seriously from continued depressed conditions. Data collected by the German Coöperative Union showed that from 1913 to 1929 there were only two years, 1926 and 1927, in which the number of new societies formed exceeded the number of dissolutions. But in 1930 the number of societies exceeded the newly formed ones by 56 and in 1931 the excess was 476. Agricultural credit associations apparently seemed to have been particularly hard hit. The accompanying table shows the development of certain of the more important types of societies in Germany in 1931.

DEVELOPMENT OF SPECIFIED TYPES OF CO-OPERATIVE SOCIETIES IN GERMANY

Type of society	Number of societies, Jan. 1, 1931	Number of societies, Jan. 1, 1932
Credit societies .....	22,160	21,880
Craft societies <sup>a</sup> .....	1,770	1,726
Workers' productive associations	722	722
Dealers' purchasing associations <sup>b</sup>	1,274	1,296
Consumers' societies .....	1,727	1,695
Housing societies .....	4,065	3,939
Agricultural associations .....	18,736	18,800

<sup>a</sup> Raw materials, warehousing, service, delivery.

<sup>b</sup> Associations of private retailers for cooperative purchase of goods sold in their business.

**COÖPERATIVE MARKETING IN PALESTINE.** Since 1920, when the passage of the coöperative law permitted the formation of coöperative societies in Palestine, this country has seen the appearance of 249 societies, of which 49 were agricultural organizations, 82 land purchase and building societies, and 55 credit groups. By 1931 the agricultural organizations were playing a very significant part in the farming life in the country, since practically all of the almond and wine grape crop, about 80 per cent of the milk, eggs, poultry and vegetables and 40 per cent of all the oranges raised in the country were being marketed through coöperative organizations. The annual value of the Jewish agricultural products disposed of in this fashion was over \$2,175,000, of which about \$1,500,000 worth was being exported.

**COÖPERATIVE SOCIETIES.** See COÖPERATION.

**COPPER.** Preliminary statistics of copper output, stocks, and other trade factors in 1932 showed a far greater depression in the industry than the already depressed condition of the previous year. According to the U. S. Bureau of Mines, the smelter output of copper from ores of

domestic origin in 1932 was about one-half that of 1931 and refinery production from domestic and foreign sources was 54 per cent lower than in 1931. The severe cut in production showed the efforts made by producers to bring production into balance with consumption. The consumption of copper continued to decline rapidly in 1932, however, and stocks of refined copper were higher at the end of the year than at its beginning. On June 21 a tariff on copper of 4 cents a pound was put into effect and resulted in a large decrease in imports. Exports dropped materially and were smaller for the year than imports. During the last months of the year, however, exports were at a higher rate than imports.

The quoted price of copper (electrolytic, New York refinery equivalent) was 7.025 cents a pound at the beginning of the year. The high weekly average price, 7.171 cents a pound, was reached in the week of January 16, from which level a decline started that continued, with only one important variation, until the end of the year. An upward swing in prices, that began early in August, carried the average from 5.025 cents to 6.025 cents in September and early October. The price dropped to 4.775 cents for the week ending December 17, a new low level for all time.

The smelter production of copper from domestic ores in 1932, as estimated by the Bureau of Mines, was 528,000,000 lbs., compared with 1,043,000,000 lbs. in 1931. The 1932 production was thus about one-half that of 1931; it was the smallest production recorded since 1921, exceeding the output of the latter year by only 4 per cent. The production of new refined copper from domestic sources was about 443,000,000 lbs., compared with 1,075,000,000 lbs. in 1931. The output of new refined copper from domestic and foreign sources in 1932 amounted to about 688,000,000 lbs., compared with 1,502,000,000 lbs. in 1931—a decrease of 814,000,000 lbs. or 54 per cent. The production of secondary copper by primary refineries dropped from 156,000,000 lbs. in 1931 to about 120,000,000 lbs. in 1932. Thus the total primary and secondary output of copper by the refineries in 1932 was 51 per cent below the preceding year—a production of about 808,000,000 lbs. being reported for 1932 as compared with 1,658,000,000 lbs. in 1931.

The imports of unmanufactured copper during the first 11 months of 1932, according to the Bureau of Foreign and Domestic Commerce, amounted to 371,089,938 lbs., or at a monthly rate of nearly 34,000,000 lbs. This compares with total imports of 585,892,098 lbs. for the entire year 1931, or at a monthly rate of 49,000,000 lbs. The total imports for 1932, according to the estimate, showed a decrease of approximately 208,000,000 lbs. for the year, or a drop of about 35 per cent.

The exports of metallic copper during the first 11 months of 1932 amounted to 305,177,405 lbs. as compared with 557,574,235 lbs. exported during the year 1931. The estimated total for 1932 was about 320,000,000 lbs. In the first 11 months of 1932, 236,890,703 lbs. of refined copper in ingots, bars, and other forms, and 25,742,550 lbs. of rods were exported. Of the total quantity, the United Kingdom received 67,951,907 lbs., the largest amount; France was next with 61,549,678 lbs.; Germany was third with 28,556,074 lbs.; and Italy fourth with 26,643,306 lbs.

In the entire year 1931 the United Kingdom received the largest quantity, 116,107,042 lbs.; France was next with 112,194,531 lbs.; Germany was third with 58,765,926 lbs.; and Italy fourth with 42,925,187 lbs.

Refineries reported that at the end of 1932 approximately 980,000,000 lbs. of refined copper would be in stock, a 6 per cent increase over the reserve of 924,600,000 lbs. at the end of 1931. It is estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, would be about 388,000,000 lbs. on December 31, compared with 348,000,000 lbs. at the end of 1931, an increase of 40,000,000 lbs. or 11 per cent. Total smelter and refinery stocks at the end of 1932 were 1,368,000,000 lbs., representing an increase of 95,400,000 lbs., or 7 per cent, over the previous record stocks at the end of 1931. The quantity of new refined copper withdrawn on domestic account during the year was about 527,000,000 lbs., compared with 902,000,000 lbs. in 1931, a decrease of 375,000,000 lbs., or 42 per cent. The method of calculating domestic withdrawals is shown as follows:

NEW REFINED COPPER WITHDRAWN FROM  
TOTAL YEAR'S SUPPLY ON DOMESTIC  
ACCOUNT, 1931-1932, IN POUNDS  
[U. S. Bureau of Mines estimates]

	1931	1932
Refinery production of new copper from domestic sources .....	1,075,000,000	443,000,000
Refinery production of new copper from foreign sources .....	427,000,000	245,000,000
Imports of refined copper (December, 1931, estimated) .....	174,000,000	167,000,000
Stocks of new refined copper on January 1 .....	615,000,000	924,600,000
Total .....	2,291,000,000	1,779,600,000
Exports of refined copper (ingots, bars, rods, or other forms) (December, 1931, estimated) .....	464,000,000	273,000,000
Stocks December 31 .....	924,600,000	980,000,000
Total .....	1,888,600,000	1,253,000,000
Total withdrawn on domestic account .....	902,000,000	527,000,000

**COPYRIGHT.** Registrations for the fiscal year, 1931-32, according to the report of the U. S. Register of Copyrights, numbered 151,735, as compared with 164,642 for the preceding year. Of these, 57,065 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 50,944, those printed abroad in a foreign language, 4784, while the remainder, 1337, were English books registered for *ad interim* copyright. The chief classes of the remaining registrations, in the order of numerical importance, were: Periodicals, 39,177 numbers; musical compositions, 29,264; prints and pictorial illustrations, 3354; photographs, 2570; dramatic or dramatic-musical compositions, 6296; works of art, including models or designs, 2590; maps, 1774; drawings or plastic works of a scientific or technical character, 1697; motion-picture photoplays, 800; and motion pictures not photoplays, 739. The renewals numbered 5888, as compared with 5998 in the preceding year. The fees applied during the year amounted to \$280,964. The total number of articles deposited

during the fiscal year ended June 30, 1932, was 242,689.

The gross receipts of the Register's office for the fiscal year were \$284,719; the total expenditure for salaries, \$247,440, and for supplies, \$1225. The year's business was not quite so large as that of the previous year, due no doubt to the general depression affecting all lines of business. One new copyright proclamation was issued extending to nationals of Greece the privilege of securing copyright in the United States in exchange for a like privilege accorded to American authors by that country. See LAW IN 1932.

**CORAL REEFS.** See GEOLOGY.

**CORN.** As reported by the International Institute of Agriculture the estimated production of corn in 1932 of 17 countries, not including France, the Soviet Republics, Manchuria, and countries south of the equator, amounted to 3,614,128 bushels, an increase of 414,842,000 bushels over 1931 when 3,169,737 bushels were produced. The total production of the 17 countries reporting was 14 per cent above the yield of the preceding year and 15.9 per cent above the annual average for the five years 1926-1930. These countries reported a corn area in 1932 of 136,697,000 acres which was 2.3 per cent greater than the area in 1931 and 7.9 per cent above the average annual acreage for the five-year period given.

Exclusive of the United States the production of the leading corn producing countries for the year was estimated as follows: Rumania 213,771,000 bushels, Yugoslavia 177,940 bushels, Italy 10,546,000 bushels, Hungary 95,894,000 bushels and Bulgaria 41,511,000 bushels. Italy plants a crop in the spring and another, known as *cinquantino*, later in the summer. The yield of this latter crop which averages about 4,000,000 bushels annually is not included in the above estimate. The 1932 yields of Bulgaria, Hungary, and Yugoslavia were about 50 per cent above the annual average of the five years 1926-1930. For this five-year period the average annual yield of the Soviet Republics was estimated at 124,325,000 bushels produced on 8,483,000 acres, and the area planted in 1932 was reported as 9,084,000 acres or 6.7 per cent below the acreage of 1931 but 7.1 per cent above the five-year average. The crop of Argentina in 1931-1932 was estimated at about 325,000,000 bushels. The Canadian crop of 1932 was reported as 5,231,000 bushels on 137,000 acres, a reduction of over 13 per cent below the five-year average.

The 1932 corn crop of the United States according to estimates reported by the Department of Agriculture was 2,908,045,000 bushels or 13 per cent above the crop of 1931 and 41 per cent larger than the short crop of 1930. The amount harvested for grain was 2,508,920,000 bushels. The remainder of the crop used for silage, fodder, hogging down, and grazing was included in the total production as grain equivalent. The acreage of corn for all purposes, 107,729,000 acres, was about 2.3 per cent larger than in 1931. The average yield of 27 bushels per acre was the same as the annual average for the ten years 1919-1928. All Corn Belt States except Ohio and Nebraska reported average or higher yields. High yields and increased acreages made the harvest of the North Central States reach 76 per cent of the country's total production. In the Western Plains States the yields were much below the average.

The yields of the leading corn producing States covering corn grown for all purposes were reported as follows: Iowa 539,872,000 bushels, Illinois 387,043,000 bushels, Nebraska 268,293,000 bushels, Missouri 186,721,000 bushels, Minnesota, 176,916,000 bushels, and Indiana 173,962,000 bushels. These States produced approximately 60 per cent of the total crop recorded for the 48 States. The average yield per acre ranged from 25.3 bushels in Nebraska to 46 bushels in Iowa, and in the remainder of the States from 7 bushels in Colorado to 42 bushels in Connecticut and New Jersey. In acreage Iowa stood first with 11,732,000 acres, Nebraska second with 10,644,000 acres, and Illinois third with 9,001,000 acres. The reserves of old corn held on farms as of Nov. 1, 1932, were estimated at 7 per cent of the crop harvested for grain in 1931, or 154,974,000 bushels as compared with 78,951,000 bushels on farms a year ago and 61,063,000 bushels on Nov. 1, 1930.

During the fiscal year ended June 30, 1932 the United States exported 3,344,000 bushels of corn valued at \$1,607,000 while 2,529,000 bushels shipped abroad the preceding year represented a value of \$2,316,000. Corn products sold to foreign countries included 156,000 barrels of corn meal, 1,772,000 pounds of corn breakfast foods, 9,606,000 pounds of hominy and grits, and 774,000 pounds of corn oil. The imports for the year amounted to 386,000 bushels, or less than one-fourth the quantity imported during the preceding fiscal period.

The results of a study by the Department of Agriculture indicated that for several thousand farms reporting the cost of producing an acre of corn varied from \$18.22 in 1931 to \$23.21 in 1927 and the cost per bushel from 61 cents in 1931 to 89 cents in 1930, the yield per acre being the principal factor determining the cost. The ninth National Corn Husking Contest was held Nov. 10, 1932, near Galva, Illinois, and Carl Seiler of Illinois won the national championship by husking 36.91 bushels in the allotted 80 minutes which also constituted a world record.

**CORN BORER.** See ENTOMOLOGY, ECONOMIC.

**CORNELL UNIVERSITY.** A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 5859 students enrolled in the autumn session of 1932, distributed as follows: graduate school, 857; law school, 150; medical college, the main division of which is in New York City, 254; arts and sciences, 1872; architecture, landscape architecture, and fine arts, 163; engineering, 907; veterinary medicine, 170; agriculture, 923; and home economics, 607, including 182 enrolled in a four-year course in hotel administration. Of these students 1353 were women. The registration for the 1932 summer session was 1951.

The faculty, composed of 1248 members, had 312 professors, 206 assistant professors, 15 lecturers, 393 instructors, and 322 assistants. Cornelius Betten, director of resident instruction in the colleges of agriculture and home economics, was appointed dean of the university faculty; William A. Hagan, professor of veterinary pathology and bacteriology, was appointed dean of the veterinary college; Carl E. Ladd, formerly director of extension, was made dean of the colleges of agriculture and home economics. Additions to the staff of professors included Edwin A. Burt, professor of philosophy; Henry H. Dukes, professor of veterinary physiology; and the fol-

lowing professors in the New York division of the medical college: Eugene F. Pool, clinical surgery; Henricus J. Stander, obstetrics and gynecology; George J. Heuer, surgery; Eugene L. Opie, pathology; James M. Neill, bacteriology and immunology; Herbert S. Gasser, physiology; George S. Amsden, psychiatry; Nathan C. Foot, surgical pathology; Joseph C. Roper, clinical medicine; and William R. Williams, clinical medicine. The faculty lost by death Adam C. Gill, professor of mineralogy and petrography, emeritus; George S. Moler, professor of physics, emeritus; Graham Lusk, professor of physiology; and Martha van Rensselaer, professor of home economics; and by retirement, Clarence A. Martin, professor of architecture; Louis M. Dennis, professor of inorganic chemistry; Nathaniel Schmidt, professor of Semetic languages and literatures and oriental history; Charles L. Dana, professor of clinical medicine, department of neurology; Charles L. Gibson, professor of surgery; and William L. Russell, professor of psychiatry. The visiting lecturer in chemistry on the George Fisher Baker foundation was Prof. Alfred Stock of the Technische Hochschule, Karlsruhe, Germany. The Messenger lectures on the evolution of civilization were given by Prof. Frank Jewett Mather, Jr., of Princeton.

Buildings completed and occupied during the year were the large group on York Avenue, New York City, erected for the New York Hospital-Cornell Medical College Association; Myron Taylor Hall, a gift of Myron C. Taylor of New York City for the law school; and Mennen Hall, a dormitory unit given by William G. Mennen and his sister Mrs. Elma Mennen Williams of Newark, N. J., in memory of their parents.

The productive funds on June 30, 1932, were \$25,039,469. The income applicable to current expenses of the fiscal year 1931-32 was approximately \$8,000,000, including \$3,171,077 of State and \$459,110 of Federal appropriations. Gifts amounting to \$573,252 were received during the fiscal year. The land and buildings were valued at \$13,807,965, and the equipment at \$9,535,917. The library contained 850,000 volumes. President, Livingston Farrand, M.D., L.H.D., LL.D.

**CORSICA.** An island in the Mediterranean, situated about 100 miles southeast of the French coast at Nice, constituting a department of France. Area 3367 square miles; population 297,235 in 1931. Chief city Ajaccio, population 23,392.

**COSACH.** See CHILE under *Production and History*.

**COSMIC RAYS.** See PHYSICS.

**COSMOLOGY.** See ASTRONOMY.

**COSTA RICA**, cō'stā rē'ka. A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

**AREA AND POPULATION.** With an area estimated at 23,000 square miles (about the same as West Virginia), Costa Rica had a population of 471,525 at the census of May, 1927. The estimated population on Jan. 1, 1931, was 516,031. About three-fourths of the population is of European descent, 10 per cent mestizo, 10 per cent Negro (mostly British West Indians on the banana plantations of the East coast), and 5 per cent Indian. The chief cities, with their estimated populations in 1930, are: San José, 54,705; Alajuela, 8339; Heredia, 8091; Cartago,

7425; and Limón, 7604. For the five-year period 1926-30, births averaged 22,780 annually and deaths 11,175; the average rates per 1000 inhabitants were 46.2 and 22.7, respectively.

**EDUCATION AND RELIGION.** Elementary education is free and compulsory. In 1931, there were 516 elementary schools, with 51,668 pupils, and three secondary institutions, with 1796 students. There are colleges at Cartago and Alajuela. Roman Catholicism is the state religion.

**PRODUCTION.** Agriculture is the principal industry, the chief crops being coffee, bananas, cacao, corn, rice, sugar cane, tobacco, vegetables, and fruits. Coffee and bananas account for about nine-tenths of all exports. Production of coffee in 1930 was 51,880,000 pounds (valued at \$10,419,000); bananas, 5,834,000 stems (\$4,376,000); cacao, 7318 metric tons (\$966,000). Livestock in 1929 included 399,000 cattle, 83,000 swine, 85,000 horses, and 8000 mules. Gold mining has declined in importance. In 1929 there were 6532 industrial establishments, including dairy and farm industries such as the processing of coffee, sugar cane, and cacao. The 1931 coffee crop was 50,738,000 pounds, valued at about \$10,116,000; sugar, about 9,000,000 pounds; bananas (exports), 5,080,000 bunches; cacao, 6600 metric tons, valued at \$669,000.

**COMMERCE.** Costa Rica's imports during 1931 were valued at \$8,690,000, as compared with \$10,847,000 in 1930, and exports at \$14,280,000, as against \$16,331,000 in 1930, according to preliminary figures. Of the total 1931 imports, the United States furnished 51.8 per cent, the United Kingdom 11.5 per cent; and Germany 10.45 per cent. The United States took 25.15 per cent of the exports, the United Kingdom 58.55 per cent, and Germany 10.58 per cent. The chief export items in 1931 were coffee, bananas, cacao, and wood. Leading import items were machinery and tools, iron and steel, cotton fabrics, and chemicals.

**FINANCE.** The budget estimates for the calendar year 1931 placed revenue at 26,906,000 colones and expenditure at 24,078,084 colones (colon equals \$0.25 at par). In 1930, actual receipts amounted to 27,468,498 colones and expenditure to 32,513,818 colones, excluding provision for amortizing the public debt. Public instruction, internal development, and finance are the principal items of expenditure. Preliminary 1932 returns showed ordinary revenues of \$6,187,616 and expenditures of \$7,128,407.

The public debt on Jan. 1, 1931, amounted to 94,095,000 colones (\$23,524,000), as against 79,191,000 colones (\$19,798,000) at the beginning of 1930. The 1931 figure included \$7,447,500 of American debt, £1,564,000 of British debt, and \$1,800,000 in bonds held abroad for the electrification of the Pacific Railway. In December, 1932, the internal debt was reported at \$6,854,286 and the external debt at \$18,601,523, or a total of \$25,455,809.

**COMMUNICATIONS.** Railways in 1930 extended 413 miles, of which 81 miles (the Pacific Railway) were government owned. There were about 161 miles of motor highways. Air-mail service between San José and Puntarenas was established in 1930; at Puntarenas connection is made with the Pan-American Airways system.

**GOVERNMENT.** The executive power is vested in the President who is elected for four years and legislative power in a chamber of representatives, called the Constitutional Congress, with 43 depu-

ties, elected for four years, one-half retiring every two years. Voting for President, deputies, and municipal officers is secret, direct, and free. President at the beginning of 1932, Don Cleto González Víquez, who was succeeded on May 8, 1932, by Dr. Ricardo Jiménez Oreamuno.

**HISTORY.** The presidential election held in Costa Rica Feb. 14, 1932, failed to give any candidate the necessary majority. Of the three leading candidates, Ricardo Jiménez Oreamuno received 35,343 votes; Manuel Castro Quesada, former Minister to Washington, 22,029; and Carlos María Jiménez Ortiz, 17,302. The Costa Rican law provided that when no candidate received a majority a run-off election should be held between the two candidates receiving the largest votes. On the day following the election, however, Castro Quesada led an attempted *coup d'état*, which government troops suppressed after four days of severe fighting. Under the terms of the truce, arranged through United States Minister Eberhardt on February 18, Castro Quesada and his chief aide, General Volio, were allowed to leave the country. Before leaving, however, Quesada Castro resigned his candidacy and the anti-Jiménez group controlling Congress thereupon declined to hold a second election.

Forceful action to place Don Ricardo Jiménez in the presidency was threatened by his adherents. The delicate situation thus created was ended May 1, when the new Congress met and, in accordance with the Constitution, elected three Vice Presidents, the first of whom was to assume office as President. The election of Don Ricardo as First Vice President automatically made him President and he was formally inaugurated on May 8. It was the new incumbent's third term as President. Long an outstanding figure in Costa Rican politics, he was the only man ever to have held the three highest offices in the country—those of President of Congress, Chief Justice, and President of the Republic.

Part of the opposition to the new President was due to his reputation for friendship toward American economic interests in Costa Rica. Many of his opponents in Congress were won over to his support when on July 8 he submitted, and later signed, a bill for a moratorium on the payment of service charges on the national foreign debt. The bill was passed with only three opposing votes. It authorized the suspension of interest and amortization charges on American bonds of 1926 and 1931 and the British bonds of 1911 for three years, beginning in November, 1932, and January, 1933, respectively. The funds thus retained, amounting to \$3,306,420 for the three years, were to be applied to the payment of existing government internal obligations. The government hoped in this way to reduce by one-half its internal debt and balance its budget. On August 29, the government announced, through its fiscal agents J. and W. Seligman & Co. in New York, that in exchange for interest coupons on each \$1000 bond held abroad, up to and including that payable on Nov. 1, 1935, it would give \$23 in cash and funding bonds of \$222 principal amount, bearing 5 per cent interest, payable semi-annually and maturing in 1951.

In November President Jiménez announced that Costa Rica would denounce the Central American treaties signed at Washington in 1923, the most important of which was the general treaty designed to promote peace in that region by denying recognition to governments

established by other than constitutional means. Foreign Minister Leonidas Pacheco in the same month commenced a tour of the Central American countries (excepting Salvador) in an effort to secure their denunciation of the non-recognition treaty. Denunciation by three countries would cause the pact to lapse automatically for all five signatories. Since the treaty was sponsored and adhered to by the United States, Costa Rica's action was regarded as a blow at the U. S. State Department's Central American policy. The move was attributed to the desire of President Jiménez to recognize the revolutionary régime of President Martínez in Salvador, recognition of which was withheld by the United States (see SALVADOR). Failing to win the approval of President Ubico of Guatemala and informed of the negative attitude of President Moncada of Nicaragua, Señor Pacheco ended his tour at Guatemala City. Nevertheless, President Jiménez on December 24 signed a decree denouncing the Central American peace pacts, effective in January, 1934.

Conservative elements were alarmed during the year by the reported rapid spread of communism. In the municipal elections of December 4, the Communist party secured more than 1300 votes out of 6300 cast in San José and made equally striking gains in other municipalities. See COMMUNISM.

**COST OF LIVING.** See STATISTICS.

**COTTON.** The estimate of the Crop Reporting Board of the U. S. Department of Agriculture, on Dec. 8, 1932, was that the cotton crop of the United States for 1932 would amount to 12,727,000 bales of 500 pounds, compared with 17,096,000 in 1931, and 13,932,000 in 1930. The estimated crop approximated that of 1927 which totaled 12,956,000 bales. The yield of lint per acre was estimated to average 162.1 pounds as compared with 201.2 pounds in 1931, and 151.4 pounds, the average for the period 1921-1930. Of 38,227,000 acres in cultivation July 1, 1.7 per cent were abandoned and 37,589,000 left for harvest.

The world carry-over of American cotton on Aug. 1, 1932, 3,600,000 bales larger than the previous record carry-over in 1921, amounted to 12,982,000 running bales compared with 8,868,000 bales in 1931 and 6,287,000 in 1930. The carry-over in the United States was approximately 9,585,000 bales. There were 2,109,000 bales of Indian cotton, 908,000 of Egyptian, and 1,113,000 bales of sundries, totaling 17,112,000 compared with 13,905,000 in 1931. The New York Cotton Exchange estimated the carry-over of all cotton at 17,295,000 bales and production in 1932 at 21,700,000 bales. The world supply of American cotton for 1932-33 was estimated at the end of the year by the U. S. Department of Agriculture at 25,700,000 bales, 300,000 bales below the record for 1931-32 but 2,200,000 bales above the large supply of 1926-27, and considerably greater than the total world consumption of American cotton for the past two years combined.

In important cotton growing countries, the areas planted to cotton in 1932 amounted to 78,100,000 acres versus 82,400,000 acres in 1931. Production in 1932 in the countries (reporting) was estimated to be, for the United States 12,727,000; India, 3,542,000; U.S.S.R. (Russia), 1,900,000 to 2,000,000; China, 2,300,000; Egypt, 870,000; Brazil, 364,000; Mexico, 95,000, and Chosen (Korea), 127,000 bales. The total world

production was estimated at the close of 1932 at 24,000,000 bales.

The world's production of commercial cotton in 1931 was estimated by the U. S. Bureau of the Census to be 26,329,000 bales, of which the United States produced 16,629,000 (running) bales; India, 3,375,000; U.S.S.R. (Russia), 1,850,000; Egypt, 1,288,000; China, 1,100,000; Brazil, 525,000; Peru, 205,000; Mexico, 207,000, and all other countries, 1,150,000 bales. The International Institute of Agriculture reported the 1931 crops of important cotton-growing countries to be, for the United States, 17,096,000; India, 3,401,000; Egypt, 1,287,000; U.S.S.R. (Russia), 1,843,000; Mexico, 207,000; Chosen, 101,000, and Uganda, 163,000. Estimates were that Anglo-Egyptian Sudan produced 206,000 bales from 336,000 acres.

The cotton crop of the United States for 1931, as reported by the Bureau of the Census, the estimated crop for 1932, and the quantity reported ginned to Dec. 13, 1932, are shown in the accompanying table:

UNITED STATES COTTON CROP, 1931-32

States	Crop, 1931 500-lb bales	Estimated crop, 1932 500-lb. bales	Reported ginned Dec 13, 1932 Running bales
United States . . .	17,095,594	12,727,000	12,085,648
Alabama . . . . .	1,419,689	980,000	916,893
Arizona . . . . .	115,061	82,000	51,170
Arkansas . . . . .	1,906,736	1,260,000	1,217,195
California . . . .	176,560	126,000	112,168
Florida . . . . .	43,164	15,000	15,880
Georgia . . . . .	1,392,665	845,000	839,654
Louisiana . . . . .	899,922	610,000	595,277
Mississippi . . . .	1,761,203	1,150,000	1,131,131
Missouri . . . . .	288,991	285,000	276,174
New Mexico . . . .	98,124	76,000	57,546
North Carolina . .	756,294	640,000	644,563
Oklahoma . . . . .	1,261,123	1,080,000	1,026,616
South Carolina . .	1,004,730	695,000	691,274
Tennessee . . . . .	594,512	450,000	425,746
Texas . . . . .	5,322,453	4,445,000	4,044,459
Virginia . . . . .	42,423	28,000	28,455
All others . . . . .	11,944	10,000	11,547

The accompanying table includes for 1932, under the ginning report 622,125 round bales counted as half bales and also 6677 bales of American-Egyptian cotton, practically all grown in Arizona. The 1932 crop of Arizona was estimated to include 12,000 bales of American-Egyptian cotton. The crop of Lower California, usually marketed through California, was estimated at 13,000 bales, not included in the totals.

Oil mills in the United States, during the cotton year ended July 31, 1932, crushed 5,328,014 tons of cottonseed. The products of the seed included 875,677 bales of linters, 1,510,874 tons of hulls, 2,401,202 tons of cake and meal, and 1,694,122,987 pounds of oil.

Exports of cotton and linters for the year ended July 31, 1932, amounted to 8,707,548 running bales of cotton and 116,319 bales of linters or a total of 8,823,867. Mills in the United States consumed in this period 4,866,016 bales, versus 5,262,974 in the previous year. The principal exports of cotton were to Germany, 1,570,312; United Kingdom, 1,344,385; France, 463,092; Italy, 649,059; Spain, 305,567; other European countries, 531,686; and Japan, 2,293,831. The United States during the same period, imported from Egypt 81,091 bales; Peru, 3528; China, 7191; Mexico, 20,641; British India, 17,513; and from other countries, 1605 bales.

Consumption of all cottons in the United States

fell nearly 400,000 bales in 1931-32, or to 4,866,016 bales compared with 7,091,000 bales in the high year 1928-29. Most of the cotton used by American mills was consumed in the cotton-growing States, 4,033,351 bales versus 677,462 in New England, and 155,203 in other States. Of 31,442,174 spindles in place Dec. 31, 1932, 23,775,136 were active during December, of which 16,831,244 were located in Cotton States, 6,271,728 in New England, and 672,164 in other States. The number of active spindle hours averaged in Cotton States 261, in New England 112, and elsewhere 119.

The world's consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1932, according to the U. S. Bureau of the Census, was about 22,896,000 bales. Reports of the International Federation of Master Cotton Spinners' and Manufacturers' Associations indicated it to be 22,323,000 bales compared with 22,488,000 in the previous year. The world consumption of all growths in 1931-32 remained practically unchanged from the low level of 1930-31. World consumption of American cotton increased 1,400,000 bales in 1931-32, but except for 1930-31 the total consumed, amounting to 12,319,000 bales, was the lowest since 1923-24. The increase in consumption of American cotton in 1931-32 was evidently made at the expense of foreign grown cottons. The consumption of Egyptian cotton, 980,000 bales, increased more than 150,000 bales, whereas consumption of Indian cotton, 4,789,000 bales fell nearly 900,000 bales, and consumption of sundries dropped to 4,235,000 bales from 4,864,000 in 1930-31. The unsatisfactory world demand conditions prevailing throughout 1931-32 were held to account for the continued low world consumption of all cottons. Increased consumption of American cotton reflected the small supplies and relatively high prices of Indian and Chinese cottons.

The price of middling  $\frac{7}{8}$  inch cotton at the 10 spot markets averaged 5.89 cents per pound during the year ended July 31, 1932, compared with 9.61 in 1930-31 and 15.79 cents in 1929-30. The decline in prices from 1930-31 to 1931-32 was greater both in cents per pound and percentages for the longer than for the shorter staple cotton. The prices of American cotton in domestic markets declined in early June to the lowest levels in years, spots in New York on June 9 going to 5 cents, 0.31 cents under the low of 1898; in New Orleans 4.95 cents, 0.20 above the low of 1898, and the 10 spot markets averaged 4.76 cents compared with 7.62 cents on June 9, 1931. Cotton prices rose from June to September, 1932, as financial conditions improved and when it became known that the crop was greatly reduced. Much of the advance was lost by the end of October. The price in August, 1932 averaged 7.08 cents, September 7.40, October 6.37, November 5.9, closing on December 30 at 6.10 New York, 5.95, New Orleans, and 5.90 at Galveston. The average price received by producers at local farm markets on Dec. 15, 1932, was estimated at 5.4 cents per pound for lint and \$8.87 per ton for cottonseed compared with 5.5 cents and \$11.01 respectively on Dec. 15, 1931. The decline was attributed to several factors including the fall in prices of industrial stocks; the recognition that although activity in textiles had improved, the recovery in the heavy industries was slight; and the fact that the large carry-over of Amer-

ican cotton gave the second largest supply on record despite the small crop.

The condition of the crop in the United States on August 1 approximated 65.6 per cent of normal compared with 74.9 in 1931, and boll weevils were present in greater numbers than in any season since 1928, especially in the Delta lands along the Mississippi. Showery weather favored the multiplication of weevils in many places, although the cotton was generally blooming and fruiting fairly well. The amount of fertilizer applied to cotton in 1932, totaling 894,863 tons in the United States, was much less than for several years past, and in many places the plants were smaller than usual. This was one of the factors causing the relatively low condition of the crop. During August, prospects declined in practically all States in the eastern and central portions of the Cotton Belt, where weevils had been quite active and weather conditions were mostly unfavorable to the crop. Moisture conditions were favorable in the western portions of Oklahoma and Texas. In most parts of the Belt the crop was mature and a large proportion of the bolls were open by October 1. Picking progressed somewhat slower than might be expected, because most growers were using the labor available on their own farms, rather than hiring additional help. Weather conditions early in November were mostly favorable for picking and ginning in sections where appreciable quantities remained to be harvested, and while there was some lowering of grades by rains, the loss in yield from this cause was small.

The boll weevil continued to be the most important pest of the cotton from middle Texas eastward. The largest carry-over recorded in 17 years followed the very mild winter of 1931-32, and seasonal conditions and other factors were such that except in western Texas and western Oklahoma, most of the weevil damage for the year fell on squares and bolls developing during July and early August. The pink bollworm menaced the crop in the valley of the upper Rio Grande in Texas and New Mexico, where infestation was heavier than ever before. Infestations in the Salt River Valley of Arizona and certain adjoining sections of that State and New Mexico, and certain areas in western Texas were very largely suppressed as a result of eradication measures and the quarantines were modified. Rather wide infestation disclosed in southern Florida was confined to non-commercial plantings and wild cotton. Discovery of pink bollworm in cotton in Columbia and Alachua countries, Florida, led to the restriction of the shipments of cotton and cotton products from those and four adjoining counties to prevent the spread of the pest. The U. S. Department of Agriculture, the cotton States, and cooperating agencies continued to study measures for the control of these pests and for *Thurberia* weevil, cotton flea hopper, cotton leaf perforator, bollworm, and miscellaneous insects attacking cotton. See ENTOMOLOGY, ECONOMIC.

Cotton of the 1932 crop ginned up to Dec. 1, 1932, was considerably lower in grade but averaged only slightly different in staple from that ginned up to Dec. 1, 1931, according to a report based on the 11,630,731 bales of American upland cotton reported by the Census Bureau as ginned prior to that date. Estimates were that 29 per cent was white strict middling or better, about 15 per cent white strict low middling and

below, and 14 per cent spotted and yellow tinged cotton. There was no radical change in the relative proportions of the various staple lengths from that ginned to Dec. 1, 1931. Practically no change was noted in the proportion of cotton shorter than  $\frac{7}{8}$  inch but there was a larger proportion of  $\frac{15}{16}$ ,  $\frac{1}{8}$ , and  $\frac{1}{4}$  inch, with smaller proportions of  $\frac{3}{4}$ , 1,  $\frac{1}{16}$  inch and longer. Slightly more than 93 per cent of the cotton ginned up to Dec. 1, was tenderable.

Standard grades for cottonseed, the results of demand from the cottonseed industry and extensive research by G. S. Meloy of the U. S. Department of Agriculture, were approved by Secretary Hyde and made effective as permissive official standards as of June 1, 1932. In two years' tests by the industry, the grades were applied successfully to more than 2,000,000 tons of seed.

In the principal producing countries in the British Empire, excluding India, the cotton crops in 1930-31 were estimated to be for Anglo-Egyptian Sudan, 106,471 bales; Uganda, 158,000; Nigeria, 15,063; Tanganyika, 19,360; Union of South Africa, 6798; Australia, 9500; West Indies, 5000; Iraq, 2625; Nyasaland, 7806; and Cyprus, 3999. In India 3,401,000 bales were reported for 1931-32, and 4,372,000 for 1930-31, and the total area planted in 1931-32 was estimated to be 19,654,000 acres. The crop expected from the acreage planted and conditions on Dec. 1, 1932, was forecasted at 3,542,000 bales.

The estimated production for 1930-31 in other political divisions of the world, besides the major cotton countries, was for Paraguay, 18,449; Spain, 7431; Algeria, 5161; Dahomey, 5848; French Sudan, 12,637; Italian Somaliland, 3459; Syria and Lebanon, 12,397, and French Indo-China, 5782.

Egypt produced in 1931-32 a crop estimated at 1,287,000 bales, compared with 1,715,000 in 1930-31. Of about 1,215,340 bales of the 1931-32 crop, reported by the International Institute of Agriculture as ginned by Apr. 1, 1932, around 236,890 bales was Sakellarides. The 1932-33 crop was estimated at 870,000 bales, with 18 per cent less of Sakellarides and 36 per cent less of other varieties. The acreage restriction law, largely responsible for the small acreage this crop year, was virtually removed. A new decree was to restrict the Sakellarides acreage to 40 per cent of the cultivated land of each proprietor, whereas, the acreage in 1932-33 was restricted to 30 per cent. The restriction on other varieties was raised from 25 to 50 per cent.

Russia, according to late estimates, produced from 1,900,000 to 2,000,000 bales in 1932 as compared with 1,851,000 in 1931. The area was reported at from 5,400,000 to 5,800,000 acres compared with 5,346,000 in 1931, an increase from 1 to 8.5 per cent. Up to November 25, only 68.5 per cent of the raw cotton producing plan was delivered, i.e., about 1,375,000 to 1,500,000 bales of the 2,000,000 to 2,200,000 bales called for by the plan. Picking in November was said to have been hampered by unfavorable weather conditions, dissatisfaction among the peasants, and poor organization of labor. Considerable losses were indicated at the time of picking and during transportation.

The Chinese crop was expected to approximate 2,300,000 bales, about 35 per cent more than the 1,700,000 bales of 1931, and compared with a 5-year average production of about 2,081,000

bales. The short crop of 1931 was due to reduced yields caused by flood damage. The yield per acre in 1931 was 169 pounds, versus 206 pounds in 1930-31, and was the lowest in a decade.

**COUNTRY LIFE.** See AGRICULTURE.

**COURT GAMES.** RACQUETS. Clarence C. Pell, veteran from Tuxedo, continued supreme in this difficult court game in 1932, winning the national championship in February for the thirteenth time since 1915. In the tournament held in Boston the perennial titleholder suppressed all opposition and stifled the best shots of Herbert N. Rawlins, former national squash racquets champion, in the final. The remarkable veteran was merely carrying on his campaign and a week before the national tournament he captured the famed Gold Racquet in the annual tournament at Tuxedo, N. Y. Pell had bowed in this fixture to Stanley G. Mortimer in 1931, but defeated George R. Fearing of Boston handily in the 1932 final. Pell was defeated in the national doubles when he and his partner, Mortimer, defending champions, succumbed to the sterling play of W. C. Wright and Stanley W. Pearson in the semi-final. Wright and Pearson, Philadelphians, took the crown by defeating W. Palmer Dixon and Alan L. Corey of New York in the final match. Charles Williams of Chicago retained his title of world's open champion by the simple expedient of not being called upon to defend it. Sir John Child won the Canadian amateur championship at Ottawa in February.

**COURT TENNIS.** William C. Wright of Philadelphia also maintained his supremacy in that highly intricate sport of court tennis in 1932, successfully defending his national singles crown by beating Frank P. Frazier of Boston in the final round. Frazier had beaten Wright 10 days before in the final for the classic Gold Racquet. Wright and his famous partner, Jay Gould, who has been a topnotcher in the sport for the past 20 years, again won the doubles crown. J. C. Bell and Edward M. Edwards, of Philadelphia, 1930 winners and also finalists in 1931, were beaten by Wright and Gould in the final. Pierre Etchebaster, wonderful Basque who holds all the professional titles of the game, was not called into action, no professional tournaments being held.

**SQUASH RACQUETS.** Beekman Pool, of Harvard University, dominated the squash racquets season of 1932, succeeding his brother, J. Lawrence Pool, as national champion, and also winning

the Canadian national honors as well as the intercollegiate title. To win the national he was forced to his best play to down T. E. Jensen of Boston in the final. W. Jay Iselin of New York was the finalist in the Canadian fixture and Donald Strachan of Princeton reached the final round of the intercollegiate. Just to keep his hand in and to keep the name prominent, J. Lawrence Pool won the Metropolitan championship.

Harvard University again won the national team championship and the Harvard University Club team in New York toppled the Racquet and Tennis Club for the Metropolitan honors. One of the surprises of the season was the unexpected defeat of Beekman Pool, 1931 winner, in the final of the Rockaway Hunting Club's annual Gold Racquet tournament in December. Pool succumbed to Neil Sullivan of the Germantown Cricket Club in five gruelling games. The United States team retrieved the Lapham Trophy from Canada in the matches at the Hartford Golf Club, eight matches to none. Philadelphia took the Lockett Trophy in the team matches with Boston and New York in December.

Mrs. William F. Howe, Jr., of Boston was another titleholder to recapture her throne after the lapse of a year. She defeated Miss Ruth Hall, of Philadelphia, 1931 winner, in the final. The women of the East took up the game seriously during the year and in the fall new leagues in New York, New Jersey, and Westchester were formed, round-robin matches, and league matches played weekly.

Jack Summers, coach at Massachusetts Institute of Technology, was again superb in professional ranks, experiencing little trouble in retaining his grip on the championship.

**SQUASH TENNIS.** Harry Francis Wolf, New York Athletic Club representative and former Williams College tennis player, again clearly asserted his superiority over all amateur squash tennis players. The national champion retained his title easily and continued unbeaten in three years of tournament competition. Wolf trounced Rowland B. Haines, champion before Wolf came into prominence, in the national final and in the Harvard Club invitation. Also he won the Princeton Club invitation in December, proving absolutely unbeatable as he threaded his way through the brilliant field. In the final he crushed Philip T. Moore, fifth ranking player in the country. Wolf thus gained every honor available, the Princeton invitation of the previous year going to Edward McLaughlin, ranked No. 3 in the country, when Wolf did not enter.

William G. Hall of the Crescent Athletic Club carried off Class B honors and the national veteran's championship went to William P. Hoffman of the Bayside Tennis Club, thereby breaking the monopoly on the latter title held for five years by Dr. Harold R. Mixsell of the Princeton Club. With Wolf as the mainstay, the New York Athletic Club captured Metropolitan team laurels, class B honors going to the Crescent A.C., and the Yale Club taking the title in class C.

Frank Ward, professional at the City Athletic Club, continued his reign as open champion, successfully defending his crown in the open championship without any trouble.

**CRANSTON, EARL.** An American Methodist Episcopal bishop, died near New Richmond, O., Aug. 18, 1932. He was born in Athens, O., June 27, 1840. On graduating from Ohio University in 1861, he entered the Ohio infantry and served in it and the West Virginia cavalry throughout the Civil War, being advanced to the rank of captain. He was ordained to the ministry in 1867 and held various charges in Marietta, Portsmouth, Columbus, and Cincinnati, O.; Winona, Minn.; Jacksonville, Ill.; Evansville, Ind.; and Denver, Colo. He was presiding elder during 1880-84 and publishing agent of the Methodist Episcopal Church during 1884-96. Following his election as bishop in 1896, he spent two years 1898-1900) touring the Orient as episcopal visitor, and in 1907 was appointed commissioner for the Methodist Episcopal Church on the union of Methodism in Japan. Also he was chairman of the Commission for Unification of Methodism which sought to reunite the Methodist Episcopal Church and the Methodist Episcopal Church, South. In 1904 he became resident bishop of Washington, which post he held until his retirement in 1916.

**CRESSON, WILLIAM PENN.** An American author and diplomat, died in Stockbridge, Mass., May 12, 1932. He was born in Claymont, Del., Sept. 17, 1873, and attended the University of Pennsylvania and the École des Beaux Arts in Paris. The Ph.D. degree was conferred on him by Columbia University in 1922. After practicing architecture in Washington during 1905-07, and engaging in ranching in Nevada during the next two years, he was appointed in 1909 secretary to the American Legation at Lima, Peru. In 1912 he was transferred to London as second secretary to the American Embassy. Other appointments included secretary to the American Legations at Quito, Ecuador (1913-14), Panama (1914-15), Petrograd, Russia (1915-17), and Lisbon, Portugal (1917). During the World War he was chief of the American military mission at the Belgian General Headquarters. He was assistant professor of international law at Princeton University during 1920-21, lecturer on diplomatic history at Georgetown University during 1924-27, and Fletcher professor of international law and diplomacy at Tufts College during 1927-29. Also he served as diplomatic secretary at the Conference on the Limitation of Armament in Washington in 1921. His works include: *Persia—The Awakening East* (1908); *The Cossacks—Their History and Country* (1919); *The Holy Alliance—The European Background of the Monroe Doctrine* (1922); *Diplomatic Portraits* (1923); and *Francis Dana—A Puritan Diplomat at the Court of Catherine the Great* (1931).

**CRETE, krēt.** Fourth in size among the islands of the Mediterranean and the site of an ancient civilization, Crete was ceded to Greece by Turkey, May 30, 1913. It lies 150 miles southeast of Greece. Area, 3195 square miles, population (census of 1928), 386,427. The capital, Khania (Canea), had 26,604 inhabitants (1928); Irakleion (Candia), the largest city, 33,404. The chief products are currants, grapes, wine, olives, citrus fruits, some cereals, and garden products. The island is an intermediate station on the

London-India air-mail line. Crete is administered as a department of Greece. See GREECE.

**CRICKET.** The cricket followers of the United States were catered to in 1932 by the visit of a team of Australian cricketers, headed by the world famous batsman—Don Bradman. The players from "down under" were exceptionally skilled and played matches in most of the large cities of the North American continent. Fifty-one matches were played, and the Antipodeans won forty-four, drew six, and lost one (to Vancouver). Bradman was easily first in batting, playing in 51 innings, being not out 14 times for an amazing total of 2782 runs and an average of 102.16. This set a new batting record for Canada and the United States. His best effort was at Guelph, Ont., where he batted 260 runs. A. F. Kippax, S. J. McCabe, A. N. Nutt, E. K. Tolhurst, V. Y. Richardson, L. C. Fleetwood-Smith and A. A. Mailey were others who sparked on the tour.

The annual cup competition of the United States Cricket Association was won by the Paterson (N. J.) Cricket Club, which defeated the Ardmore eleven of Philadelphia in the final game. The championship of the Metropolitan District Cricket League was again taken by the Westchester County Cricket Club, and that of the New York and New Jersey Cricket Association went to the Brooklyn Cricket Club.

**CRIME.** Writing for the *Journal of Criminal Law and Criminology*, Mr. H. B. Chamberlin declares that organized crime exists on such a large scale in the United States because it is tolerated by society. According to him protection is the keynote of criminal success and hence there is to be found a direct connection between organized vice and political organizations. Mr. Chamberlin says:

The bootlegger, the panderer, the fixer, and the racketeer perform services for which there is a demand.

One of the great troubles is that many criminals draw profits for services performed for conventionally respectable members of society.

To illustrate—take the supplying of liquor. Beer is an industry engaging the direct services of perhaps a million people. The Prohibition department at Washington says that the annual business has a gross value approaching two billion dollars. This business is controlled by organized criminals. Its products are consumed by the respectable men and women of America. It is outlawed by our statutes. It is patronized by our citizens. As the business is outlawed, it can not be regulated by law. For that reason it has provided its own substitutes for law and order, and these substitutes involve more breaches of our recognized law and order.

The "booze racket" has not only broken down the Prohibition law, but the tariff law and the revenue law, and it breaks down officers of the law by bribery. It settles its own disputes by coercion and murder. It succeeds, as do the gambling and vice rings, by profitably contributing to sinful satisfaction.

According to Mr. Chamberlin, organized crime is successful also because of the continuance of public apathy. The suppression of crime is spasmodic, law enforcement is lax, and commercialized vice has vitality and survives because it is a valuable political adjunct. Mr. Chamberlin thinks that organized crime will never be eliminated but it can be controlled when public sentiment is sufficiently aroused and wisely directed. He, therefore, recommends the organization of fact finding groups to furnish the public "with information concerning the efficiency and integrity of its law enforcing agencies in connection with the activities of criminals."

Striking somewhat the same note, later in the

year, was a group of speakers appearing before the American Bar Association's annual convention in Washington in October. Mr. H. S. Perry, of Adrian, Michigan, a newspaper publisher and director of the Associated Press, charged that the domination of American law machinery by political influence was responsible for the crime ratio and the inefficiency of law enforcement. However, Attorney General Mitchell, at the same meeting, insisted that reforms in Federal criminal procedure were succeeding in coping with the rising tide of crime. A number of improvements were recorded by the Attorney General, particularly the following: the transfer to the Department of Justice of the prohibition unit; legislation authorizing the Attorney General to forego prosecution of juvenile delinquents and return them to their home communities, and the development of a probation system in connection with Federal courts. Nevertheless, the Federal judiciary was still confronted by problems of an overwhelming nature. As illustrative of this situation the Attorney General cited the fact that in the fiscal year 1931-32, 92,000 criminal cases were begun in the Federal courts as compared with 82,000 in the previous year, and 96,000 criminal cases were disposed of as against 91,000 in the previous year; from the beginning of the Hoover administration the number of Federal prisoners rose from 25,000 to 53,000.

It was apparent during the year that, while crime news did not figure as sensationally in the public press as it had in previous years, the future was regarded with considerable misgiving by serious students of the problem. The possibility of the repeal of prohibition, it was agreed, was no doubt likely to introduce various factors into the crime situation whose force and numbers it was not possible to chart as the year closed. Into what channels of activity would organized crime, particularly that large group whose activities had been centred in the illicit liquor traffic, be directed with the modification of the Volstead Act and the very probable legalization of the manufacture and distribution of beer? To a number of observers it seemed that such illegal forces would make an even greater effort to play an important part in the functioning of legitimate business, particularly in retail and distributive trades. In other words, to many students there was a danger of a growth rather than a diminution of racketeering as a result of changes in the country's prohibition law. Racketeering is already playing a significant part in various commercial activities in some of our larger American cities. Created usually as a device to strengthen the hands of either employer or employee groups, usually in industrial conflicts, racketeering, apparently in the last few years, has become an independent enterprise with the criminal openly forcing his way either into commercial organizations or labor unions to gain domination over them in order to perpetuate himself. It has been estimated that racketeering costs the citizens of Chicago annually more than \$145,000,000. The cost of racketeering is felt by the American citizen in a variety of indirect forms, particularly in increased insurance rates on window glass breakage, burglary, trucking of goods, and incendiary fires, and increased costs of services because of the presence of racketeering groups in many retail and distributive trades. In Chicago, for instance, it has been

apparently established that racketeering has been existing in the following industries, either as a result of its introduction by business men or trade union leaders: ice, coal, general teaming, van drivers, machinery moving, ice-cream, lumber, florists, baggage transfer, excavating, grocery and marketing, building materials, commission drivers, cleaning and dyeing, laundry.

According to Mr. G. L. Hostetter, writing in the *New York Times Magazine* of Oct. 30, 1932, the racket theory is simple and works somewhat as follows: "Control the forms of service and you control industry. Extending this theory into practice, attempts have been made and are continuing in various cities to 'organize' retail hardware, beauty shops, garages, sausage manufacturers, automobile painters, stock exchange clerks, bakers, barbers, fish dealers, ladies' garment workers, metal polishers, tile setters, sheet metal, carbonated beverages, kosher butchers, power laundries, hand laundries and news deal-

convictions totaled 30. There was a slight decrease in arrests for burglary during the year and also for felonious assaults. Assault and robbery cases increased by 23 per cent and the number of arrests for hold-ups with a gun rose from 1079 to 1612. There were more than 12,000 automobile thefts during the year of which 60 per cent were stolen by minors between the ages of 16 and 20. Commissioner Mulrooney's report again pointed to an increase in youthful criminals. Of the 477,324 arrests made during the year, 6327 were of children under 16, 38,959 were persons between 16 and 21, 97,990 were between 21 and 25, and 114,175 were between 26 and 30. A total of 400,476 convictions was obtained which marked an increase of 10 per cent over 1930. As in the recent past about three-fourths of all the convictions were for infractions of the traffic laws and other local ordinances. The accompanying table analyzes arrests by ages and groups in the City of New York during 1931.

TOTAL NUMBER OF ARRESTS BY AGES, BY GROUP, FOR THE ENTIRE YEAR OF 1931

<i>Criminal group</i>	<i>16-20 years</i>	<i>21-25 years</i>	<i>26-30 years</i>	<i>31-35 years</i>	<i>36-40 years</i>	<i>41-50 years</i>	<i>51-60 years</i>	<i>Over 60 years</i>	<i>Total arrests</i>

Total . . . . .	38,959	97,980	114,175	88,623	64,422	51,215	13,365	2,258	477,324

ers." Arson and bombing have become characteristic weapons of the trade in Chicago. For example, in this city, from the beginning of 1928 until Oct. 1, 1932, there was a record of 509 bombs which caused a total damage of \$1,081,069. There can be no question that racketeering to-day is a national problem, and coping with it demands not only honest and conscientious law enforcement machinery but the mobilization of active public opinion to force reappearance of decent standards in the business and labor worlds.

NEW YORK CITY. During 1931, according to the annual report of the New York Police Commissioner Edward P. Mulrooney, 489 murder and manslaughter cases occurred in the city as compared with 421 killings in 1930, 357 in 1929, and 339 in 1928. Of the total of 489 killings in 1931, the Commissioner attributed 56 to disputes and revenge among gangsters, 14 to rows among gamblers, 13 to unpeaceful pursuits in the bootlegging business. *Crimes passionnels* accounted for 40 violent deaths and family disputes accounted for 72. According to the Commissioner proportionately fewer murderers escaped conviction than in previous years. While the number of cases was increasing 16.1 per cent, convictions increased by 77 per cent over 1930. In the earlier year seven persons were convicted of first degree murder; in 1931, the

In addition to the above there were five arrests of persons under sixteen years for offenses against the person and 6322 arrests of persons of the same age for juvenile delinquency, making a total of 6327, which figures are included in the total of 477,324.

GREAT BRITAIN. Apparently Great Britain, which until recently seems to have been immune from crime waves, is beginning to report a history of crime with which America has been only too familiar for a long time. Reporting on the crime record for 1930, the latest year for which records are available, the Home Office pointed out that there was an increase in serious crimes known to the police from 134,581 to 147,031. As in America the larger number of crimes are apparently being committed by young people. Two-thirds of those found guilty in 1930 were under 30 years and two-fifths were under 21 years of age. The Home Office's official explanation for the growth of crime was: first, the lawless and adventurous character of many of the generation who were without parental control in the war; and, second, the industrial depression, the severity of which in the North particularly tempted many of the young people to the less serious forms of robbery. While the number of murders has not significantly changed since 1913 (there were 111 in that year and 109 in 1931), indictable offenses as a whole have in-

parts and the rule of Italy fell to the Emperor Maximian. The Milan of this epoch is depicted as the cross-roads of the great Empire, the capital of Italy. Here was indeed a city of economic bustle, of intense life, and activity. This was the throbbing Milan, the *Mayland* of the Gauls six centuries B.C., and the *Mediolanum* of the Romans! Specifically the novel deals with Christianity already firmly rooted notwithstanding all the imperialistic persecutions, not excluding Diocletian's. In one part of the story the splendor of all Milan is revealed assembled in the Gabinio Theatre, Maximian, and Diocletian, also spectators. Here the novel attains the heights of emotion and pathos when the comic actor, Genesio, Roman born, repeatedly cries out in defiance, "'Tis true I am a Christian!" For this bold manifestation he was decapitated; but not in vain, for the fervor was caught by others of the troupe. And so, like the drama evolved in this little theatre, the Christian drama of the whole Romanic Empire shows that the persecution of one man will account for the conversion of hundreds of other fellow-creatures. As a whole, the novel sustains the historic mood, though the narrative vein is well-timed to offset the tediousness usually present in novels of this type. While it is true that finely worked out detail is essential to the historic novel, it may be pointed out that the author might have condensed his work with advantage without jeopardizing its historic setting. The author has created a praiseworthy nostalgic atmosphere of a distant epoch which he not only presented splendidly but with pathos and dignity.

Bruno Cicognani's *Villa Beatrice* (Treves-Treccani-Tumminelli, Milan) which bears the imprint of a novel written along broad lines and on a solid basis, failed to gain that support which would have won for it the merit and distinction. The story lacked sustained interest and forceful characters. The characters lacked the necessary psychological focus that would render them lifelike and convincing. Cicognani's *Beatrice*, for all her antipathy to conjugal life, to parturition, etc., never fully wins sympathy, yet the novel was fairly well received. Cicognani's short stories of recent date, *Strada facendo* are to be preferred. Where Cicognani fell short in character delineation, Sibilla Aleramo sketched more sympathetically "a life," *Caris di Rosia*, in her latest novel, *Frustino* (*The Whip*; Mondadori, Milan). If in his novel, Cicognani had architectonic structure, Aleramo has none at all. Her work could be called a series of sketches of the love affairs of a woman musician. The author imparted a poetic touch to the idiom which does much to cover the otherwise objectionable melodramatic note that permeates the work. Achille Campanile, who yearly furnished a screamingly funny novel, produced on schedule his *Battista al giro d'Italia* (Treves, Milan). In this Battista (or, our servant, "James") makes a tour of Italy on a bicycle. Jest and cynicism mark the dominant notes of his observations. Better still, may we be permitted to reduce Campanile's symbolic language to the subtle excoiation of the writers who make much ado about thin themes and their arid imaginations? Here attention may be called to the English version of Alberto Moravia's sensational novel, *Gli indifferenti*, (*The Indifferent Ones*; E. P. Dutton & Co., New York) translated by Aida Mastrangelo.

SHORT STORY. Bianca Gerin, little known

among the Italian women writers, made a valuable contribution to short stories in *Aprire la porta* (*Open the Door*; Ceschina, Milan). At most the stories are based on provincial themes, through which, however, gentility and humanity pervade like a delicate perfume. A finely worked-in idiom adds a touch of poetry. A finer contribution than this will hardly be furnished in several seasons. Two other women furnished collections of short stories. In *La propria sorte* (*One's Own Fate*; Marsano, Genoa), Piera Delfina Sessa portrayed a galaxy of characters from an analytical point of view. The "internal struggle" and psychological strokes throw them into high relief. They have pulse and command attention. The author's language is terse and distinctive. A few of her themes have Germanic settings and characters. Lina Pietravalle, better known than either of the afore, discussed authors, gave us sketches of a regional type in *Marcia nuziale* (*Nuptial March*; Bompiani, Milan). Sketched before us are rugged landscapes, strong men, and sturdy women. The work developed in cursory style, makes pleasant reading punctuated with comic episodes. Nino Savaresi based his stories and fantasies, *Storie e fantasie* (Ceschina, Milan), on rustic themes. They are composed with a light touch of philosophy that imparts an undertone of seriousness to the work. *Pane e vino* (*Bread and Wine*) is little short of being a masterpiece. It is perhaps the best story in the collection. Sea stories and legends were collected by E. Bavetta in *Inferni e paradisi del mare* (Agneselli, Milan), and attractively told and pleasingly arranged. The legends are annotated. A group of twelve short stories, *Horse in the Moon* (E. P. Dutton, New York), drawn from Luigi Pirandello's *Novelle per un anno*, and translated masterfully from the Italian by Samuel Putnam, appeared within the year.

THEATRE. The season, which seemed to lack enterprise to hold its own fell below par, notwithstanding the new hope of the project of establishing a National Institute of Drama on the plans submitted by Signor D'Amico. Of the scanty plays, the first worthy of mention was Giovacchino Forzano's *Villafranca* (Barbèra, Florence). Making use of the historic motive, specifically, that of Italy's struggle for independence in the feverish days of 1859, the author has brought into focus a trio that figures portentously in that not remote year—Cavour, Victor Emanuel II, and Napoleon III. In this type of drama the author has had most success. Here it suffices to say that *Villafranca* is good drama and contains red-blooded characters. It is free from pomposity and slow movement. Like plays often have these pitfalls. This play met with public favor in its run at the Teatro Argentina in Rome.

Giorgio Umani composed a dramatic poem in five scenes in *Prometeo* (*Prometheus*; Eroica, Milan). The composition has more value as poetry than as drama. The author must have sensed the futility of stage production of his topic, and yet, could he be excused for minimizing the dramatic moment of his composition? Had the author taken greater care in developing the dialogue interest and the dramatic effect, the work would have reached a far wider public. Considering Giulio Mariani's *La veggente di Betania* (*Mary Magdalen*; Eroica, Milan), the dramatic motives are over-developed, and the poetic values negligible. The stage production of this play

## CRUISERS

the first to serve in that capacity. On his retirement in 1927, he practiced law in Chicago until 1931.

**CRUISERS, NAVAL.** See NAVAL PROGRESS.

**CRUSTACEA.** See ZOOLOGY.

**CUBA.** A republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana (Habana).

**AREA AND POPULATION.** The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. The population census taken September–November, 1931, showed a total of 3,962,344 inhabitants, compared with 2,889,004 at the census of 1919. The population was distributed among the several Provinces as follows:

POPULATION OF CUBA, BY PROVINCES

Province	Area in sq. miles	1919 census	1931 census
Pinar del Rio .....	5,206	261,198	349,480
Havana .....	8,170	697,589	985,500
Matanzas .....	8,256	312,704	337,119
Santa Clara .....	8,257	657,697	815,412
Camagney .....	10,064	228,918	408,076
Oriente .....	14,211	780,909	1,072,757
Total .....	44,164	2,889,004	3,962,344

About 72 per cent of the population is white, the remainder being chiefly Negro and mulatto. The enforced registration of foreigners in the island in 1932 revealed that approximately one-tenth of the population were aliens.

**EDUCATION.** Elementary education is free and compulsory. According to the President's message to Congress of Apr. 4, 1932, public primary schools in 1930–31 numbered 3767, with 434,219 enrolled pupils and 7572 teachers; private schools, 457, with 26,622 pupils; night schools, 94, with 7393 pupils; upper primary schools, 31, with 7236 pupils. There is a special government Institute for advanced education in each Province. The University of Havana had 4795 students in 1929–30.

**PRODUCTION.** Cuba is the world's largest producer of sugar, and cane-growing dominates the economy of this primarily agricultural island. As a result of world over-production, a drastic price decline, and the raising of the United States tariff on Cuban sugar to 2½ cents a pound in 1931, sugar in 1931 and 1932 was produced at a loss and the industry was facing disaster. The decline of the Cuban sugar industry is shown in the accompanying table from the U. S. *Commerce Yearbook*.

CUBAN SUGAR PRODUCTION

Year	Mills grinding Number	Sugar pro- duction 1,000 long tons	Average price per pound Cents	Total value \$1,000
1921–22 to 1925– 26, average ...	182	4,888	3.26	808,424
1926–27 .....	177	4,509	2.64	266,621
1927–28 .....	172	4,038	2.20	197,175
1928–29 .....	163	5,156	1.72	198,661
1929–30 .....	157	4,671	1.23	128,702
1930–31 .....	140	3,121	1.09	76,197

The Chadbourne Agreement of Dec. 8, 1930, provided for the segregation of 1,500,000 tons of surplus sugar and the marketing for five years of no more than 3,400,000 tons annually, plus 20 per cent of the surplus. The 1931–32 produc-

tion was fixed at 2,700,000 tons by a decree issued Mar. 26, 1932, and the 1932–33 crop at 2,000,000 tons by a decree of Nov. 2, 1932. Tobacco, coffee, cacao, cereals, potatoes, and fruits are other leading crops. The 1931 tobacco crop was 80,707,000 pounds (82,152,000 in 1930). In 1932, tobacco exports were valued at \$12,926,270, or 43 per cent below the 1931 figure. The 1931–32 sugar crop totaled 2,602,336 tons.

The extensive forests contain valuable cabinet and dye-woods, fibres, gums, resins, and oils. The island has large iron-ore and manganese deposits, worked principally by American interests, as well as copper, gold, and salt. Since 1925, there has been a steady growth of secondary manufacturing industries behind a protective tariff, principally in the canning, clothing, footwear, furniture, textile, paint, paper, glass, and cement industries. Iron ore exports in 1931 were 116,126 metric tons (190,270 in 1930); copper output, 13,291 metric tons (16,693).

**COMMERCE.** Cuba's foreign trade in 1931 continued the phenomenal decline of 1930, but imports fell more sharply than exports. The trade balance was favorable by \$4,958,401 in 1930 and by \$38,753,553 in 1931. Exports in 1931 totaled \$118,865,553 (\$167,410,669 in 1930) and imports were \$80,112,000 (\$162,452,268 in 1930). The value of the leading exports in 1931, with 1930 figures in parentheses, was: Raw sugar, \$64,918,344 (\$92,471,106); refined sugar, \$13,654,735 (\$12,732,364); leaf tobacco, \$16,635,366 (\$25,101,872); tobacco products, \$6,296,779 (\$8,477,309); molasses, \$4,859,984 (\$11,407,494); fruits, \$2,991,281 (\$4,226,252). Sugar exports declined 20 per cent in volume and 29.8 per cent in value, compared with the previous year. The principal import classes in 1931 and 1930 were valued as follows: Food products and comestibles, \$29,734,000 (\$60,976,000 in 1930); stones, earth, ores, glass, and clay products, \$8,194,000 (\$15,962,000); machinery, instruments, etc., \$5,950,000 (\$14,085,000); chemicals, etc., \$7,797,000 (\$13,543,000); cotton and cotton manufactures, \$8,094,000 (\$13,445,000).

While the total drop in 1931 export values was 29 per cent, shipments to the United States declined only 23.3 per cent; almost 75 per cent of all exports went to the United States (about 69 per cent in 1930). The United States supplied 57.3 per cent of all Cuban imports, as against 56.6 per cent in 1930. The value of imports from the United States in 1931 was \$45,940,000, compared with \$91,872,000 in 1930 and about \$500,000,000 in 1920, when Cuban prosperity reached its peak.

**FINANCE.** In budget estimates for the fiscal year ended June 30, 1932, both revenue and expenditure balanced at \$52,000,000, as compared with estimates of \$69,500,000 for 1930–31 and \$85,450,000 for 1929–30. Actual preliminary returns for the 1931–32 budget operations showed a deficit of about \$10,000,000. In order to meet interest and amortization payments totaling \$9,500,000 due June 30, 1932, on the public-works debt, the government secured an additional credit of \$2,278,125 from American bankers. In the 1932–33 budget, estimated revenues were placed at \$51,700,000 and expenditures at \$51,475,214. In September, 1932, however, steadily declining income forced a further reduction in expenditure. The Cuban Government had not published the net result of budget operations since the figures covering operations in 1928–29.

Monthly figures published in the *Gaceta Oficial* indicated a deficit of \$8,306,240 in the ordinary account for 1930-31 and a deficit of \$3,955,646, in 1929-30. The 1930-31 ordinary revenues totaled \$59,580,764 and expenditures \$67,887,004.

American investments in Cuba as of Jan. 1, 1931, were estimated by the U. S. Department of Commerce at \$1,138,957,000, of which \$544,012,000 were invested in sugar. British investments were estimated at £36,556,369, including £29,269,613 in railways. According to figures released by the Cuban Treasury in August, 1932, the funded debt totaled \$153,754,000, exclusive of some \$42,000,000 of sugar segregation bonds. Public-works bonds outstanding were reported to total \$87,500,000; external indebtedness, \$58,388,000. The floating debt on Dec. 31, 1932, was estimated at from \$35,000,000 to \$50,000,000.

**COMMUNICATIONS.** Cuba in 1930 had 3064 miles of railway line, of which the United Railways of Havana (1393 miles) and the Cuba Railway (778 miles) were the chief systems. Government highways extended 1990 miles. The great Central Highway was opened to traffic in 1931. Domestic air service is highly developed, while international lines connect Cuba with the United States, Mexico, and most of the Latin-American republics. In 1930, 5543 vessels of 22,997,053 gross tons entered and cleared the ports in the foreign trade. A weekly freight-car ferry service from New York to Havana was inaugurated on Oct. 10, 1932.

**GOVERNMENT.** The Constitution, as amended May 11, 1928, vests executive power in a president, elected for six years and ineligible for reelection; legislative power rests in a national congress of two houses, the Senate of 37 members elected for nine years and the Chamber of Representatives of 128 members, elected for six years by male and female suffrage. The Senate is renewed in part and the House is renewed by halves every three years. President in 1932, Gen. Gerardo Machado y Morales (Liberal) who was inaugurated May 20, 1929, for a second term expiring May 20, 1935. The three parties represented in Congress—the Liberal, Conservative, and Popular parties—are completely controlled by their leaders in Congress, the majority of whom supported the Machado administration and its programme. The government's platform called for a comprehensive system of public works, diversification of industry, and the encouragement of public instruction and agriculture.

#### HISTORY

**THE GROWTH OF TERRORISM.** When President Machado on Dec. 22, 1931, terminated negotiations for a compromise settlement with the opponents of his veiled dictatorship, the nation gradually relapsed into an orgy of political terrorism and governmental repression, such as had accompanied the anti-Machado revolt of August, 1931. The President followed his announcement that he would serve out his full term of office, ending in 1935, with efforts to conciliate the Opposition. A number of measures passed by Congress and signed by the President during January, 1932, extended general amnesty to political prisoners involved in the 1931 revolt, some 248 of whom were released. Among the 25 insurgent leaders freed were former President Mario G. Menocal and Col. Carlos Mendieta, the two rebel chieftains. Pardons were withheld, however, from

students charged with bombing attempts or illegal possession of explosives.

Conciliatory measures failed to check the sporadic bombings and political disturbances, originating in many instances among students. These occurrences grew in intensity throughout the year, despite heavy-handed repression. On February 2, President Machado took steps to consolidate his virtually absolute authority by a decree creating a national militia, under his direct command. The militia was to include all national police and volunteers. A law enacted February 16 made all persons charged with bombing or terroristic activities subject to military courts. The measure affected about 150 students then held on charges of this nature. Three of the student prisoners were placed on trial before a military court April 11; on April 26 they were sentenced to eight years' imprisonment. Meanwhile Senator Borah read before the U. S. Senate (April 11) a letter from the Cuban Patriotic League giving an account of the case.

The government's next move was a Presidential decree of April 19, establishing absolute control over foreigners remaining more than 60 days in the country. The measure was aimed at foreign Communists and agitators. The Cuban Supreme Court, which in 1931 had ruled out several of the President's dictatorial measures, again stepped into the breach with two decisions. The first, issued on April 26, declared unconstitutional the Presidential decree of July 1, 1931, which closed the University of Havana and suspended salaries of the faculty members. The second, issued May 14, ruled out the law of February 16 giving military tribunals jurisdiction to try alleged terrorists. The decision voided the eight-year sentences imposed on the three student prisoners April 26.

In the days preceding the 30th anniversary of Cuban independence on May 20, the police uncovered new revolutionary plots and jailed 85 additional political prisoners, including Col. Carlos Mendieta and Alberto Méndez Penate, another of former President Menocal's lieutenants. Menocal himself took refuge in the Brazilian Legation on May 23. These developments were accompanied by a new series of bombings, culminating in an attempt to assassinate President Machado on June 10. Wholesale arrests followed, in which the Opposition leader, Dr. Pedro Herrera Sotolongo, and many prominent citizens of Havana and Santa Clara were incarcerated. On June 23, Machado signed a Congressional measure suspending constitutional guarantees throughout Cuba for another year and authorizing the President to extend the period for another two years if he so desired. This law, prolonging the military rule in effect since Dec. 11, 1930, empowered Machado to maintain himself in office by force of arms until the expiration of his term.

Former President Menocal sailed from Havana July 2, having obtained a Cuban passport upon the agreement that he would remain abroad for one year and not interfere with Cuban politics. His departure caused no cessation of terroristic activities. Capt. Miguel Calvo, Chief of the Cuban Secret Police, and two escorting policemen were shot to death on a Havana street July 9. In the middle of the month Havana was divided into two military districts, under the direct supervision of General Herrera, Chief of Staff of the Cuban Army. Widespread opposition to the government was indicated by the resignations of the

president of the Cuban Supreme Court and the Cuban Ambassador to Mexico, Márquez Sterling, and by the action of the faculty of Havana University in voting (July 12) to suspend for a further period the educational and academic activities of the institution.

A lull in political activities during August was followed in September and October by another wave of bombings and assassinations, in which both government and Opposition supporters were victims. In this underground warfare, the most bloody incidents occurred in Havana, September 27. Dr. Clemente Vazquez Bello, President of the Senate, head of the Liberal party, and right-hand man of President Machado, was riddled with submachine-gun bullets and shotgun slugs from a passing automobile. A few hours after his death, three leading members of the Opposition, the brothers Gonzalo, Guillermo, and Leopoldo Freyre de Andrade, were shot down in their home, apparently in reprisal. Dr. Miguel Angel Aguiar, another Machado opponent shot the same day, died later of his wounds. Police, inspecting the cemetery in which the remains of Dr. Bello were to be buried the next day, discovered bombs which they believed were planted for the purpose of wiping out high government officials when they assembled for the funeral services. Fearful of assassination, 11 prominent Opposition leaders took refuge in foreign embassies and legations in Havana.

The death of Dr. Bello caused a reorganization of the Liberal party leadership. He was succeeded as President of the Senate by Major Alberto Barreras and as president of the Liberal party by Dr. José Barcelo, Governor of Oriente Province. Col. Carlos Machado, brother of the President, succeeded Dr. Bello as President of the Santa Clara Liberal Provincial Assembly. Another change in the Cabinet had occurred on June 1, when Dr. Orestes Ferrara, Cuban Ambassador to Washington, became Secretary of State. Oscar B. Cintas, Cuban business man, was appointed to the Washington post.

The election of Nov. 1, 1932, brought no change in the situation, although accompanied by disturbances previous to election day in which 15 were killed and 70 wounded. The opposition boycotted the polls and all contests were between individuals pledged to support the government. The elections replaced half the House of Representatives, two Senators, and all municipal and provincial officials.

On November 28, a military court imposed the death sentence on three socially prominent youths accused of killing Lieut. Díez Díaz, chief of the Rural Guards at Artemisa, on May 21. The same day President Machado signed a decree releasing 86 political prisoners, who had been in jail for many months. On December 1 constitutional guarantees were reestablished and martial law was ended in all Provinces except Havana. The police outside of Havana Province were demilitarized on December 5. Toward the end of the month there was a new outbreak of terrorism and of government reprisals. It was reported December 28 that the police were quietly arresting numerous students and recently liberated Oppositionists. The same day, Dr. Fausto Menocal, brother of former President Menocal, and Dr. Pedro Cue, a Havana University professor, fled to the United States. The year ended with another characteristic episode. The body of Juan Gonzalez Rubiera, a 17-year-old student, was

found riddled with bullets in a Havana street December 30. Early that morning police attempted to arrest Rubiera and another student. The youths were reported to have gravely wounded Sergeant Rafael Castro before Rubiera was captured. The police explained Rubiera's death by saying that he was killed while trying to escape.

**THE ECONOMIC SITUATION.** The political developments of 1932 were not unrelated to the intensification of the economic depression and the consequent financial straits of the government. The administration managed to avert default on its foreign obligations by additional borrowing in New York. Despite higher tariff duties imposed on imports March 17 and measures designed to increase taxes, government revenues steadily declined (see *Finance*). Toward the end of September it was reported that the salaries of employees in most governmental departments were from three to four months in arrears. The army and navy, who received the preference in the distribution of incoming tax payments, were paid up to August. This accounted for the army's continued support of the Administration.

The steady decline in the exchange value of the Cuban silver dollar, which was at a discount of about 5 per cent on August 24, further embarrassed the government. The decline took place in the face of a heavy influx of \$3,586,859 in silver in the form of new money early in the year.

**OTHER DEVELOPMENTS.** The island was struck on Nov. 9, 1932, by a violent hurricane, which cut a wide swath from Santa Cruz del Sur, on the southern coast, to Nuevitas, on the northern coast, taking an estimated toll of 2500 lives and extensive property damage. The town of Santa Cruz del Sur was almost completely destroyed by a tidal wave accompanying the hurricane and the majority of the inhabitants were drowned. It was reported from Havana November 16 that reconstruction of the town on a new site four miles inland would begin immediately. Santiago was shaken on Feb. 2 and 3, 1932, by severe earth shocks, which caused 13 deaths and property damage of between \$1,000,000 and \$2,000,000. President Machado called a special session of Congress, opening February 3, which appropriated \$1,000,000 for relief of the stricken district. On Feb. 9, 1932, the Cuban government, received the report of Prof. E. R. A. Seligman of Columbia University, who had been commissioned by President Machado to make a study of the island's fiscal and economic situation. He suggested various reforms intended to modernize the tax administration and relieve commerce and industry of burdens considered responsible for their depressed condition.

Consult, William L. Schurz, "Cuba's Economic Isolation," *Current History*, August, 1932.

**CUFRA.** See Cyrenaica.

**CULLEN OF ASHBOURNE, BRIEN COKAYNE, FIRST BARON.** A British financier, died in London Nov. 3, 1932. Born July 12, 1864, he attended Charterhouse, and in 1883 entered the merchant firm of Antony Gibbs & Sons. From 1886 to 1900 he was in charge of the branches of this firm in Chile, and on his return to England in 1901 was made a partner. He was elected a director of the Bank of England in 1902. As deputy governor of that institution in 1915-18 and governor in 1918-20 he played an important part in guiding Britain's financial affairs during the crucial World War and post-war periods.

He was created a Knight Commander of the Order of the British Empire in 1917 and Baron in 1920.

**CUMBERLAND PRESBYTERIAN CHURCH.** A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and theological standards, and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church.

A general assembly which meets annually is the supreme judiciary, the 1932 meeting being held in Chattanooga, Tenn., May 19-24. In 1932 there were 1168 churches, reporting 752 ministers and a church membership of 70,752, in the denomination's 10 synods and 62 presbyteries. The Sunday school enrollment was approximately 52,250. The property of the church was valued at \$3,356,537, not including a \$500,000 endowment for education.

Missionary work was carried on among the Indians in the United States, in China, and South America. The denomination maintained Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. Its official organ was the *Cumberland Presbyterian*. The Rev. G. G. Hallaburton of Lakeland, Fla., was moderator of the general assembly in 1932, and the Rev. D. W. Fooks of Nashville, Tenn., was stated clerk and treasurer.

**CURAÇAO**, koo'ra-sā'ō. A Dutch colony in the West Indies consisting of two groups of islands about 500 miles apart, one group comprising the islands of Curaçao (49,444 inhabitants in 1931), Bonaire (15,687), and Aruba (6139), and the other consisting of the southern part of St. Martin (2376), St. Eustatius (965), and Saba (1688). Area, 403 square miles; population, Jan. 1, 1931, was 76,299. The capital is Willemstad, on the island of Curaçao, with a population of 20,792. Registered births in 1930 numbered 1766; deaths, 1358; marriages, 706. In the same year there were 43 schools with 10,446 pupils.

The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is oil refining. Imports in 1930 were valued at 407,215,087 guilders and exports at 416,607,756 guilders (1 guilder averaged \$0.402 in 1931). Vessels entering the ports in 1930 numbered 12,732 of 49,985,490 net registered tons. The revenue for 1931 was estimated at 8,997,360 guilders and the expenditures at 8,829,721 guilders.

The colony is administered by a governor assisted by a council of four and a colonial council of 13 members, all nominated by the sovereign. Governor in 1932, B. W. T. van Slobbe (appointed Jan. 1, 1930).

**CURLING.** The United States players demonstrated rather unexpected superiority over Canada's representatives in curling in 1932, defeating the Canadians in an exhibition at the Winter Olympic games at Lake Placid, three matches to one, 114 points to 108. The American team, C. B. Williams, F. D. Peale, C. B. Ogden, and J. W. Calder, skip, was chosen in the Allen

Memorial tournament in January. In earlier Olympic exhibition matches, United States teams from New York and Connecticut defeated Northern Ontario teams, but later Quebec, Northern Ontario, Manitoba and Kitchener took five matches from New York, Massachusetts and Michigan.

Utica's fine team won the annual Stockton Cup tournament at the Country Club at Brookline, Mass., defeating St. Andrew's No. 1, 29-12, in the final match. Utica also won the Gordon National Medal, beating Schenectady in the final, and the Richard S. Emmett Medal competition by nosing out The Caledonian Club of New York, 16 to 14.

Through the showing in the Winter Olympic games, curling gained in popularity and toward the end of the winter, weekly games were played at the Sleepy Hollow Country Club in Westchester, N. Y., which hundreds of enthusiasts attended.

**CURRENCY.** See COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; MONEY; UNITED STATES.

**CURRICULUM.** See EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES.

**CURZON COLLECTION.** See ART SALES.

**CYANIDE POISONING.** See MEDICINE AND SURGERY.

**CYCLING.** William (Torchy) Peden of Vancouver was undoubtedly the bicycle-riding champion of 1932. A former member of the Canadian Olympic cycling team he competed in 14 six-day races and was on the winning team 10 times. Teamed with Reggie McNamara, the sturdy Canadian won the race in March in New York and then conquered the field with Freddie Spencer in New York in December. He won also two races in Montreal and Milwaukee, and one each in Atlantic City, Chicago, Toronto, and Minneapolis. Riding is a sport that showed no suffering from the depression. Peden was acclaimed one of the finest riders ever to compete in the arduous game.

Bicycle racing in its other branches, professional, amateur, sprint, all-around, and motor-paced, suffered because of strikes called by the riders when the promoters and managers of races were unwilling to meet the demands for increased financial remuneration. Under the circumstances it was agreed to name those riders champions who were leading on points when the strike was called. The amateur sprint title went to Tino Reboli with fifty-two points. Cecil Walker again led the professional riders, taking the all-around championship for the eighth time and the American sprint title for the third year in a row. Alfred Letourner, French cyclist, won the national motor-paced title. The world's professional sprint championship went to Joseph Scherens of Belgium and Georges Paillard, of France, captured the world's motor-paced crown. Alfredo Binda, Italian, took the world's professional road-riding title and the world's amateur sprint title went to Albert Richter of Germany, who displaced Helge Harder of Denmark as champion.

Italian cyclists won three of the six Olympic titles.

**CYPRUS**, si'prūs. Cyprus was ceded to Great Britain for administrative purposes by Turkey in 1878, formally annexed by Britain on Nov. 5, 1914, and given the status of a British colony, May 1, 1925. Third in size among the islands of the Mediterranean, it is situated 40 miles south

of the Anatolian peninsula and 60 miles west of the Syrian coast. Area 3584 square miles; population, census of 1931, 347,959. There were 64,225 Moslems and 283,550 Christians. Capital and chief trading centre, Nicosia (population 23,677 in 1931). In 1930, elementary schools numbered 990 with a total enrollment of 49,586.

The chief agricultural products were beans, potatoes, raisins, barley, wheat, vetches, oats, cotton, sesame, olives, and silk. The mining of copper ore, asbestos, gypsum, terra umbra, and chrome is extensively carried on. Industry is relatively unimportant. Imports in 1931 were valued at £1,414,104 and exports at £1,101,708. Shipping aggregating 2,213,778 tons entered and cleared the ports in 1930. Revenue in 1931 was £728,396; expenditure, £743,076; public debt, £121,810.

Cyprus is administered by a governor, aided by an executive council. Under Letters Patent (Nov. 13, 1931) the legislative council ceased to exist and power to make laws was granted to the governor-in-council. Governor, Sir R. E. Stubbs, appointed May 26, 1932, to succeed Sir Ronald Storrs.

**CYRENAICA**, sir'ē-nā'i-kā. (**CIRENAICA**). The eastern district of the Italian colony of Libia on the north African coast. Area, about 75,340 square miles; including the Cufra hinterland zone, 285,640 square miles. Population (1931 census) 164,607, of whom 10,000 were Italians. Capital, Benghazi, 33,794 inhabitants in 1929. Agriculture, fishing, cattle raising, and salt refining are leading industries. Italian colonization is progressing.

Imports in 1930 totaled 151 652,000 lire; exports, 21,249,000 lire (1 lire equals \$0.0528 at par). The estimated revenue for 1930-31 was 248,580,000 lire, including an Italian state contribution of 204,700,000 lire; civil expenditure, 96,905,000 lire; military expenditure, 150,980,000 lire. The military force in 1929 comprised 500 officers and 16,000 men. Governor in 1932, Marshal Pietro Badoglio, whose headquarters were in Tripolitania; Lieutenant Governor of Cyrenaica, General Graziani, see **TRIPOLITANIA**.

**CZECHOSLOVAKIA**, chek'ō-slō-vā'ki-ā. A central European republic comprising the Provinces of Bohemia, Moravia and Silesia, Slovakia, and Ruthenia, together with a small part of the Teschen district. Capital, Praha (Prague).

**AREA AND POPULATION.** The area and census population, by Provinces, is shown in the accompanying table.

#### AREA AND POPULATION OF CZECHOSLOVAKIA

Province	Area, sq miles	Population 1921	1930
Bohemia . . . . .	20,102	6,670,582	7,106,766
Moravia and Silesia . . . . .	10,324	3,335,152	3,563,157
Slovakia . . . . .	18,895	3,000,870	3,330,885
Ruthenia . . . . .	4,886	606,568	725,350
Total . . . . .	54,207	13,613,172	14,726,158

At the 1921 census, Czechoslovaks comprised 65.5 per cent of the total population; Germans, 23.3 per cent; Magyars, 5.5; Ruthenians, 3.4; Jews, 1.3; Poles, 0.5; others, 0.2. There were 238,808 aliens. The population is predominantly Roman Catholic in religion. The movement of the population in 1931 was: Births, 325,182 (338,327 in 1930); deaths, 212,159 (207,630); marriages, 129,114 (136,357). The population of the principal cities at the census of Dec. 1, 1930,

with 1921 census figures in parentheses, was: Praha (Prague), 848,081 (676,663); Brno (Brünn), 263,646 (221,758); Moravská Ostrava, 125,347 (113,709); Bratislava (Pressburg), 123,852 (93,189); Plzeň (Pilsen), 114,150 (108,023).

**EDUCATION.** Elementary education is compulsory between the ages of 6 and 14 years. Illiteracy is confined almost exclusively to Slovakia. On Oct. 31, 1930, there were 1,721,615 pupils in 14,900 public and private elementary schools; 231,802 pupils in 1868 public and private higher grade schools; 88,412 pupils in 347 secondary Latin and technical schools; and 35,756 pupils in 182 public schools of commerce. The four universities of Prague (Czech), Prague (German), Brno (Czech), and Bratislava (Slovak) had 19,342 students in 1929-30 and the four technical high schools, 10,344.

**PRODUCTION.** Czechoslovakia has rich agricultural, mineral, and forest resources and the northwestern section is one of the most industrially developed regions of Europe. In 1930, about 39 per cent of the total area was arable land, 16.8 per cent was in permanent grass and pasture, and 32.8 per cent was wood and forest land. Production (in quintals of 220.46 pounds) of the chief crops in 1931, with 1930 figures in parentheses, was: Wheat, 11,221,574 (13,772,889); rye, 13,876,860 (17,875,710); barley, 10,660,067 (12,177,901); oats, 12,246,079 (13,078,175); potatoes, 97,283,083 (89,504,306); sugar beets, 52,408,366 (64,213,344). Corn, tobacco, hops, wine, flax, and hemp are other farm products. Raw sugar production in 1931-32 was 812,900 metric tons, the lowest in a decade. Livestock at the beginning of 1931 included 4,457,522 cattle, 2,433,830 cows, 2,776,215 swine, and 607,612 sheep. The 1931-32 raw-sugar output was 814,000 metric tons.

Mineral and metallurgical production, in metric tons, in 1931 (preliminary), with final 1930 figures in parentheses, was: Hard coal, 13,687,957 (14,568,000); lignite, 18,638,146 (19,224,000); pig iron, 1,164,000 (1,440,000); steel, 1,524,000 (1,836,000); salt, 190,179 (177,700). The 1932 pig iron production was 451,000 tons; crude steel, 682,000 tons; bituminous coal, 11,052,000 tons; lignite, 15,910,000 tons; and coke, 1277 tons.

There were 11,996 factories in Czechoslovakia in 1929, of which 1970 were textile mills, 2271 glass and stone works, 1839 engaged in food production, 1397 furniture and bent wood factories, 923 machine shops, 901 metal factories, 645 chemical factories, and 393 paper mills. Beer, shoes, and artificial silk are other important industrial products. Due to its differentiated economy, Czechoslovakia remained probably the most prosperous country in Eastern Europe until the latter part of 1931. Its industrial exports were then restricted by the British tariff and by the foreign exchange restrictions placed in effect in neighboring states. Industrial production consequently declined and the number of unemployed increased from 336,574 on Jan. 1, 1932, to 479,912 at the end of September.

**COMMERCE.** The value of Czechoslovak foreign

	Imports	Exports
1932 . . . . .	7,537,000,000	7,399,800,000
1931 . . . . .	11,800,535,000	13,149,393,000
1930 . . . . .	15,714,503,000	14,473,732,000
1929 . . . . .	19,987,858,000	20,498,869,000

trade has declined since 1929, as shown in the table on page 227 (figures in Czechoslovak crowns, worth \$0.0296 at par).

The leading import items (1931) were: Cereals, 1,041,761,000 crowns; cottons, 1,066,414,000 crowns; woolen goods, 947,743,000 crowns; fats and oils, 611,836,000 crowns; machinery, 406,423,000 crowns. The chief exports were: cotton goods, 1,578,286,000 crowns; iron and iron manufactures, 1,328,730,000 crowns; woolen goods, 1,139,291,000 crowns; sugar, 974,223,000 crowns; and glass, 642,800,000 crowns.

Germany in 1931 supplied imports valued at 3,300,463,000 crowns and took exports worth 2,040,214,000 crowns. Austria furnished imports valued at 851,491,000 crowns and took exports valued at 1,796,449,000 crowns. Other leading sources of imports were Poland, 619,115,000 crowns; Rumania, 566,590,000 crowns; United States, 483,600,000; and France, 453,872,000. The United Kingdom in 1931 took exports valued at 1,355,955,000 crowns; Yugoslavia, 832,213,000 crowns; United States, 804,587,000 crowns; Switzerland, 466,578,000 crowns; and France, 460,664,000 crowns.

**FINANCE.** Budget estimates for the calendar year ended Dec. 31, 1931, placed revenue at 9,843,827,000 crowns and expenditure at 9,838,525,000 crowns. The year ended, however, with a deficit of 312,000,000 crowns (\$9,360,000). Actual expenditures amounted to 12,260,000,000 crowns (about \$367,800,000), and revenues to 11,948,000,000 crowns (about \$358,440,000). The revenues included extraordinary receipts of 1,657,000,000 crowns from state enterprises, not included in the budget. For 1932, the budget estimates were: Receipts, 9,323,376,000 crowns; expenditures, 9,318,709,000 crowns. In October, 1932, a budget deficit of about 800,000,000 crowns was forecast.

The national debt at the end of 1931 totaled 37,550,514,669 crowns, of which 25,900,810,500 crowns represented the internal debt, 8,349,704,169 crowns the external debt, and 3,121,000,000 crowns the note debt. An additional foreign loan of 600,000,000 francs was negotiated in France early in 1932. The budget for 1932 set aside 2,160,722,000 crowns for the service of the national debt.

**COMMUNICATIONS.** At the beginning of 1931, there were 8217 miles of state owned or operated railways and 159 miles of privately owned lines. The state railways in 1931 carried 235,538,621 passengers and 64,667,468 tons of freight; total operating revenues were 3,692,188,973 crowns and operating expenditures 4,475,692,920 crowns. The final deficit, after taking into account all items, was 104,434,324 crowns. In 1931, there were about 49,000 miles of highways, including 5300 miles of state highways maintained by the national government. Air service was provided by five national and 15 international lines (1930). In 1930, 1,197,284 metric tons of merchandise were carried on the Danube River within Czechoslovakia and 2,200,093 tons of merchandise on the Elbe and Vltava Rivers.

**GOVERNMENT.** According to the constitution adopted by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers; and legislative power in a senate of 150 members elected for eight years and a chamber of deputies of 300 members elected for six years, the former

elected by all citizens over 26 years of age and the latter by all citizens over 21 years of age. The principle of proportional representation is applied. President in 1932, Thomas Garrigue Masaryk, reelected May 27, 1927. For the composition of the Chamber of Deputies and of the Cabinet headed by František Udržal (Czech Agrarian) in 1932, see 1931 YEAR BOOK. For changes in 1932, see *History*.

### HISTORY

**DOMESTIC AFFAIRS.** The world depression bore more heavily upon Czechoslovakia during 1932 than in the previous year. Exports were nearly 50 per cent less than in 1931 and imports declined by one-third. The contraction of industrial activity led to an increase in unemployment, which placed a heavy strain upon governmental finances. Yet the budget remained in approximate balance, due to rigid economies, additional taxation, and the inherently strong position of Czechoslovak industry and finance. The exchange value of the crown remained at par throughout the year, partly as a result, however, of government control of foreign exchange transactions. By the law of July 15, 1932, the government was authorized to continue exchange restrictions until July 31, 1934, if necessary. The loan of 600,000,000 francs (about \$24,000,000) raised in France following authorization by the French Parliament in March was required, not to meet a deficit, but to tide over the temporary lack of liquidity of the Czechoslovak Treasury's assets. Czechoslovak industry sustained a severe loss in the accidental death on July 12 of Thomas Bata (q.v.).

Premier Udržal announced at the opening of the spring session of parliament that the government's legislative programme would be confined exclusively to measures designed to check economic and financial disintegration. The bills introduced called for higher taxes on beer and on trade turnover, establishment of a special unemployment fund, and support of the state railways as against competing motor bus services. Reduction of the period of compulsory military service from 18 to 14 months was provided for in another bill. In February during the winter session of parliament a bill for the reorganization of the banking system, designed especially to increase the security of deposits, was introduced by the government. Most of this legislation was adopted during the year, Premier Udržal's bourgeois-Socialist coalition government maintaining its working majority in parliament.

Besides its financial problems, the cabinet was confronted with the problem of famine relief in the Province of Ruthenia and the revival of the separatist movement among the Slovaks and the Germans. The situation in Ruthenia led to violent attacks upon the government by the Left parties and Gov. M. Roszpal of the stricken area was forced to resign. The Slovak autonomist agitation had been quiescent since the conviction of its leader, Prof. Voitech Tuka, on charges of high treason on Oct. 5, 1929. Tuka was sentenced to 15 years' imprisonment. On Oct. 16, 1932, a meeting of some 10,000 Slovaks drew up a manifesto demanding a large measure of administrative autonomy and the replacement by Slovaks of Czech government employees in Slovakia. Father Andrej Hlinka, a lieutenant of Professor Tuka, addressed the meeting, asserting

that there was no such nation as Czechoslovakia and that the Slovaks had their own traditions.

The agitation among Germans of Czechoslovak nationality was believed to have relatively little support, as two of the German minority parties were members of the government coalition. At the end of February, 1932, the Minister of the Interior dissolved a German-Bohemian association called *Volksport* on the ground that it was allied to the Hitler movement in Germany and had become a menace to the state. Seven members of the organization were arrested and tried in the criminal court at Brno, Moravia, on charges of conspiracy against the republic.

These developments had little relation to the resignation of the cabinet, which took place Oct. 21, 1932, chiefly because of the ill health of Premier Udržal. Agrarian discontent and disagreement over the proposed budget for 1933 figured in the collapse of the ministry which had retained office since the election of Oct. 27, 1929. There were five new faces in the cabinet formed October 29 by Jan Malypetr (Czechoslovak Agrarian Republican). The other members were: Minister of Interior, Dr. Jan Czerny; Foreign Affairs, Dr. Eduard Beneš; Finance, Dr. Karl Trapl; War, Bohumil Bradáč; Justice, Dr. Alfred Meissner; Education, Dr. Fran Dérer; Commerce, Dr. Joseph Matonsek; Agriculture, Dr. Milan Hložka; Railroads, Rudolph Bechyně; Posts and Telegraphs, Dr. Emil Franke; Public Works, Jan Dostálek; Social Welfare, Dr. Ludwig Czech; Health, Dr. Frantisek Spina; Unification of Laws and Organization of Public Administration, Dr. Jan Šramek. The grouping of the parties forming the government coalition remained unchanged.

**FOREIGN RELATIONS.** As in 1931, the efforts of Dr. Beneš in the Foreign Office during 1932 were directed primarily toward mitigating the blighting effects of the economic depression upon Czechoslovak agriculture, industry, and commerce. The Foreign Minister supported the proposal for a Danubian federation advanced by Premier Tardieu of France in the spring (see UNITED STATES OF EUROPE). There was little disappointment in Czechoslovakia when the proposal was wrecked by the opposition of Germany and Italy, however. Her adherence to the scheme was prompted mainly out of consideration for her ally. Fundamentally, Czechoslovakia remained hostile to anything resembling a resuscitated Dual Monarchy. Dr. Beneš met the Foreign Ministers of the other Little Entente powers—Yugoslavia and Rumania—at Belgrade May 13–15 to consider the Danubian situation. While deploring the ultra-nationalistic economic policies of the day and asserting their readiness to cooperate in any proposed solution, the Little Entente statesmen proposed no remedies except financial assistance by the League to countries in distress. Their own countries were peculiarly subject to aggressive nationalism, which they were unwilling or unable to subordinate to economic rapprochement in Central Europe.

The solidarity of the Little Entente in defense of the status quo in Europe was strengthened by the progress of the Hitler and nationalist movements in Germany and the return of Hungary to its Italian orbit. Prince Ghika, the Rumanian Foreign Minister, visited Praha (Prague) on Jan. 19–21, 1932, to reaffirm Rumania's loyal support and cooperation in the Little Entente policies. On January 22, the three

Little Entente foreign Ministers met at Montreux, Switzerland, to formulate a joint policy in advance of the Disarmament Conference. As usual, they supported the French disarmament thesis during that conference (see DISARMAMENT). In connection with the Manchurian dispute, which came to a head before the League of Nations Assembly late in the year, Foreign Minister Beneš took a vigorous stand in support of the Lytton Report and the authority of the League, which he considered Japan had flouted. In this controversy, Czechoslovakia allied herself with the smaller powers of Europe, rather than with the noncommittal policy of France (see LEAGUE OF NATIONS; JAPAN under *History*).

The war debt controversy with the United States found Czechoslovakia aligned with France and the other European powers in demanding postponement of payments due Dec. 15, 1932. When Washington insisted upon payment, however, the December 15 installment was made. (see REPARATIONS AND WAR DEBTS). Also see LITTLE ENTENTE; FRANCE, GERMANY, HUNGARY, YUGOSLAVIA, and ITALY under *History*.

Consult Hamilton Fish Armstrong, "Versailles: Retrospect," *Foreign Affairs*, October, 1932.

**CZERNIN, OTTOKAR, COUNT OF CHUDENITZ.** An Austrian statesman, died in Vienna, Apr. 4, 1932. He was born in Dimokur, Sept. 26, 1872. After taking his doctor's degree in law at the University of Prague he served in the Austro-Hungarian diplomatic corps at various capitals. In 1903 he entered politics, being elected to the Bohemian Parliament as a member of the Constitutional party. In 1912 he became a member of the Austrian Upper House (Herrenhaus). Later in the same year he was appointed Minister to Bucharest, where he remained until Rumania declared war against Austria in August, 1916. At the end of 1916 he succeeded Burian as Minister of Foreign Affairs. Recognizing the importance of preserving the Central Empires as Great Powers, he bent all his energies toward the achievement of peace, and on the visit of the German Chancellor, Bethmann-Hollweg, to Vienna in March, 1917, proposed a peace by compromise. This proposal was to the effect that Germany should receive Poland as compensation for her sacrifice of Alsace-Lorraine and that Austria should be allowed to indemnify herself in Rumania. It resulted in the celebrated Kreuznach agreement of May 17, 1917. In the meantime Czernin had agreed to the Emperor Charles's suggestion that his brother-in-law, Prince Sixtus of Bourbon-Parma, be used as an intermediary in peace negotiations with France, but he was ignorant of the letter of Mar. 24, 1917, in which Charles assured Poincaré of his willingness to support the "just claim" of France to Alsace-Lorraine. The subsequent publication of this letter by Clémenceau, in answer to Czernin's charge that France's refusal to renounce Alsace-Lorraine was an obstacle to peace, led to Czernin's resignation on Apr. 15, 1918. The closing months of his tenure of office were marked by the conclusion in March, 1918, of the Treaty of Bucharest with Rumania, and the Treaties of Brest-Litovsk with Russia and the newly-founded eastern republics, Finland, Estonia, Latvia, Lithuania, Poland, and the Ukraine. In regard to the latter his position was still further undermined by the attacks made upon him by the Austrian Poles who resented his

ceding to the Ukraine, in order to secure a "bread peace," the district of Chelm to which the Poles laid claim.

**DAEGER, THE MOST REV. ALBERT THOMAS.** A Roman Catholic prelate, Archbishop of Santa Fe, died in Santa Fe, N. M., Dec. 2, 1932. He was born in North Vernon, Ind., Mar. 5, 1872. Upon his graduation from St. Francis College, Cincinnati, in 1889 he entered the Novitiate of the Friars Minor in Oldenburg, Ind., and studied also at the seminaries of St. Francis and St. Clement in Cincinnati and St. Boniface in Louisville. He was ordained to the priesthood in 1896 and was assigned as assistant priest to the Church of Our Lady of Sorrows in Kansas City, Mo. The following year he was transferred as assistant to the Church of St. Francis de Sales in Lincoln, Neb., of which he was made pastor in 1900. In 1902 he was sent to the missions of New Mexico, which were under the jurisdiction of the Friars Minor of the Cincinnati Province, holding pastorates in Penablanca (1902-10), Farmington (1910-17), and James (1917-19). On the resignation of the Most Rev. J. B. Pitaval as Archbishop of Santa Fe and Metropolitan of the Province of Northern New Mexico in 1918, he was named his successor, and was consecrated as the sixth incumbent of that see on May 7, 1919. He was honorary president of the Society of Missionary Catechists.

**DAHOMEY,** da-hô'mi. A French colony on the west coast of Africa forming a subdivision of the colony of French West Africa. Lieutenant-Governor in 1932, M. Blacher. See FRENCH WEST AFRICA.

**DAINGERFIELD, ELLIOTT.** An American painter, died in New York City, Oct. 22, 1932. He was born at Harper's Ferry, Va., Mar. 26, 1859, studied at the Art Students' League, New York City, and first exhibited at the National Academy of Design in 1880. In 1897 he visited Europe for purposes of study and later was appointed lecturer on composition at the Art Students' League and instructor in drawing at the School of Design in Philadelphia. Previous to his death he was head of the Permanent Art School at Blowing Rock, N. C. His productions were largely figure paintings, many of them of a religious nature, and landscape paintings. Among the former, the rich and glowing colors of which are reminiscent of the Italian masters of the sixteenth century, are the murals in the Lady Chapel of the Church of St. Mary the Virgin, New York City, "Christ Stilling the Tempest" (Metropolitan Museum of Art, New York City), "The Child of Mary" (National Gallery, Washington), and "An Arcadian Huntress" (City Art Museum, St. Louis). His importance as a landscape painter, in whom imagination and a strong sense of decorative beauty predominate, is exemplified in such works as "Slumbering Fog" (Metropolitan Museum of Art, New York City), "The Midnight Moon" (Brooklyn Institute Museum), "Storm Breaking Up" (Toledo Museum), "Swirling Mists" (City Art Museum, St. Louis), "The Valley of the Dragon" (Chicago Art Institute), "Sunset Hour" and "West Glow" (Butler Art Institute, Youngstown, O.), and "Little Town of Bethlehem" (Harrison Gallery, Los Angeles, Calif.). Other notable canvases in private collections are: "Two Women Shall Be Working in the Fields"; "The Lost Sheep"; "Christ in the Wilderness"; "Story of the Madonna"; "Madonna and Child"; "Labor and Plenty"; "Plant-

ing"; "The Mothers"; "A Madonna of the Fields"; "A Woodcutter"; "The Tanagra"; "The City That Never Was"; and "The Tower of Silence," the latter two being imaginative impressions of the Grand Canyon. Among the honors which he received were a silver medal at the Pan-American Exposition (1901) and the Clarke Prize of the National Academy of Design (1902). He was elected an associate member of the National Academy of Design in 1902 and an academician in 1906.

**DAIRYING.** The year 1932 was marked by a light demand and low prices for dairy products, a slightly reduced production, relatively cheap feed, and a small amount of stocks in storage on account of the unsettled conditions.

The prices of fluid milk declined at about the same rate as the prices of manufactured dairy products, which were very low, 92 score butter selling for less than 20 cents in New York in the summer. However, base prices for fluid milk continued relatively higher than wholesale prices of the manufactured products. Notwithstanding these low prices consumption was not stimulated sufficiently to create an active demand. The consumption of the manufactured dairy products, butter, cheese, and canned milk, showed a reduction of about 3.5 per cent as compared with 1931. There was, however, some indication of improvement toward the close of the year, particularly in butter prices.

In the face of these conditions production increased about 2 per cent in January due to an increase in the number of cows. The production per cow was lower so that in May there was a decrease of about 4 per cent in milk production. With more cows freshening in the fall of 1932 the usual seasonal decline in production was less than normal. Milk production for the year showed little change from 1931. The number of heifers being raised in the fall of 1932 began to decline, indicating that the increase in the numbers of milch cows would not continue. Poor pastures and little feeding also resulted in lower production than would have occurred had markets and prices been more favorable.

There was considerable variation in the feed prices in different sections. They were low in the areas where feeds were abundant, but in the deficient feed areas, as in New England, they were high, resulting in a less favorable ratio between feed prices and milk prices than existed during the last two seasons. High freight rates seemed largely responsible. Pastures were estimated as only 80 to 90 per cent as good as in 1925 to 1929, making more grain feeding necessary if fall production was to be maintained.

The failure of the expected seasonal advance in prices to occur until late in the year, coupled with the rather steady fall in prices from the autumn of 1931, resulted in a fluid milk price of less than \$1.70 per 100 lbs. during the latter part of the year. The dissatisfaction of producers was demonstrated by the occurrence of milk strikes in several parts of the country, seriously threatening the milk supply of several of the larger cities. Some milk was dumped in the Midwest, and the farmers of the New York Milk Shed organized to demand returns commensurate with production costs.

With the falling market the stocks of butter and cheese in storage were less than normal. There were only 107,300,000 lbs. of butter and 66,700,000 lbs. of cheese in storage on September

1, which is the peak month for cold storage holdings. These amounts were heavier than last year but only 72 per cent and 83 per cent, respectively, of the 1925 to 1929 averages. Butter production was about the same as last year, but cheese production was about 7 per cent less. Factory production of evaporated milk, an outlet for surplus milk, was about 10 to 15 per cent heavier than for the average of 1925 to 1929.

**INTERNATIONAL CONDITIONS.** World prices of dairy products were low and unsteady in 1932. The foreign trade of the United States declined not only in imports but more materially in exports.

Although milk production in Europe and North America during most of the pasture season was lighter this year than last, world production of dairy products suffered in much the same way from low prices. The seriousness of the situation was recognized in several countries so that special forms of relief were set up. For example, the Latvian government guaranteed a butter export price of 2.50 lats per kilo (21.89 cents per pound) for first grade butter. The Netherlands government also set up an agency to provide a bounty to be paid to dairy farmers.

In contrast with European and North American production, the output of dairy products for 1932-33 from the Southern Hemisphere promised to materially exceed all previous records. About 20 per cent more butter was reported as arriving at grading ports in Australia and New Zealand between August and November than was received in the previous year.

Butter markets appeared to have been affected by the various national policies of trade restriction and their influence was to counteract the effect of low prices upon consumption. German markets were materially limited by discriminatory tariffs to such an extent that production was lessened in the Scandinavian and Baltic countries which are so largely dependent on the German trade. The German butter import restrictions were, however, somewhat liberalized and revised for 1933, and became effective Nov. 15, 1932. Cheese trade was relatively unobstructed and maintained a strong position in the world markets with reduced world supplies. On account of the high tariff placed by Great Britain on butter from the Irish Free State, amounting to almost an embargo, new markets were sought for this product.

The restrictions on butter imports into countries of secondary importance as consumers of surplus dairy products, such as Belgium, Switzerland, France, and Italy, left a larger portion of the surplus products to seek the markets of Great Britain and Germany than would have occurred without these protective policies. Because of Germany's higher tariffs and quota restrictions it has been taking less and Great Britain more of the butter supplies from the international trade. During 1932 Great Britain imported 946,300,000 lbs. of butter and Germany 159,621,000 lbs. The respective figures for 1931 were 902,728,000 and 200,831,000 lbs. The stocks of butter in storage in Canada and Great Britain in the fall were low as in the United States.

Both exports and imports of butter for the United States were materially less during the first nine months of 1932 than for the corresponding period of 1931. Based on the total estimated milk equivalent for the various products, the decline was 45 per cent in exports and 13 per cent

in imports. There was thus a larger excess of imports over exports in the United States of all dairy products than existed in 1931. The excess of imports has decreased during the last six years from 1,262,852,000 lbs. of milk equivalent in 1926-27 to 378,314,000 lbs. in 1931-32.

In November domestic prices made the first material seasonal advance, but London prices showed some decline or very little increase resulting in a spread between 92 score butter in New York and Danish butter of 10 cents and New Zealand butter of 14 cents per lb. in London.

The decline of 24 per cent in the United States imports of Swiss cheese from 15,683,108 lbs. in 1931 to 11,698,756 lbs. in 1932, together with a decrease of about one-third in the exports of condensed and evaporated milk were the most important developments in the foreign trade of dairy products of the United States.

**RESEARCH.** Investigational work of interest and value to the producer and consumer of dairy products is productive of important results at the State Agricultural Experiment Stations, the United States Department of Agriculture, and other agencies. Such work covers practically all phases of the dairy industry from the economics of management of dairy cattle, the place of the dairy enterprise in the farm operations, feeding and breeding of the cattle, and methods of milking, to improved practices and technique in the manufacture and keeping qualities of milk drinks, butter, cheese, ice-cream, and canned milk, and the study of the relative value of milk from different cows for infant feeding.

A problem of considerable practical importance to the dairyman is to know what age of breeding heifers gives the most economical returns. The Missouri Agricultural Experiment Station conducted such a study and found that as the age of breeding heifers advanced their milk and fat production increased. From this study, in which the heifers varied in age at calving from 13 to over 30 months, it was concluded that the most efficient milk and fat production was obtained by breeding animals to calve at from 20 to 24 months of age.

A study of milk cooling under farm conditions by the Nebraska Agricultural Experiment Station showed that if bacterial growth in the milk was to be retarded it must be cooled to 60° F., or below, in one to one and one-half hours. The importance of a good rapid cooling equipment was thus necessary to produce a high quality product.

Another advantage of rapid cooling was demonstrated in studies at the New York State Agricultural Experiment Station at Geneva. Milk distributed in most cities is pasteurized, but this process, unless followed by rapid cooling, reduces the amount of cream rising in the bottle and thus it does not show the desired cream layer. With rapid cooling following pasteurization normal creaming occurs.

There is much interest among producers and manufacturers regarding the quality of cream that may be used in the manufacture of butter. Delayed delivery is of a distinct advantage to the producer, but obviously there is some deterioration in the cream when delivery is delayed, and too much delay interferes with the quality of the butter. The Washington, Indiana, Illinois, and other agricultural experiment stations made extensive studies of the relationship between the

quality of the cream delivered and the butter produced from it, and no single test was entirely adequate. The best indication of the quality of the butter appears to be delivery at frequent intervals. Some correlation has been found also between quality of the butter and the types of organisms in the cream and its aroma when delivered at the milk station.

Cattle breeding for milk production was expected to receive more active attention at the Allahabad Agricultural Institute in India. Holstein, Brown Swiss, Jersey, and Guernsey bulls were being bred to cows of the most promising local breeds, Scindi, Hissar, Sahiwal, and Kan-krej, with good success in the improvement of the milk production of the native breeds.

The Hannah Dairy Research Institute was formally opened in 1931 by the Duke and Duchess of York in its permanent location at Auchincruive in Ayreshire, Scotland. A dairy herd of about 40 Ayreshire cattle, a flock of sheep, and a few goats were acquired. Investigations were under way dealing with the nutrition of ruminants, the physiology of lactation, the breeding of dairy cows, bovine tuberculosis, and the condensing and drying of milk and its products.

A new dairy building, including offices, a creamery, facilities for dairy manufacturing research, and instruction laboratories was dedicated at Pennsylvania State College on Aug. 26, 1932.

**NECROLOGY.** Frederik Rasmussen, executive secretary of the International Association of Ice Cream Manufacturers, died on Feb. 21, 1932. He was a well known figure in dairy circles and was head of the Department of Dairy Husbandry at Pennsylvania State College from 1916 to 1919.

The death of Harry Hayward, formerly assistant chief of the Dairy Division of the Bureau of Animal Industry of the United States Department of Agriculture, occurred on May 4. Mr. Hayward was connected at one time with the University of Minnesota; Hamlin Dairy School in Germany; University College, Reading, England; and the Delaware, Pennsylvania, and New Hampshire Agricultural Colleges.

Dr. R. Stenhouse Williams, research professor of bacteriology in the University of Reading, England, and first Director of the British National Institute for Dairying, died February 2. He was well known for his research in the nutritional value of milk, dairy bacteriology, and the production of a clean, safe milk supply.

**DAKAR.** See FRENCH WEST AFRICA.

**DALMATIA.** A former crownland of Austria now incorporated in Yugoslavia (q.v.).

**DAMS.** The year 1932 was marked by a number of notable events in the field of dam construction—the completion of the Owyhee Dam, the completion of the first stage in the construction of the Hoover Dam, the completion of the Dnieprostroy Dam, and the beginning of four notable dams in California. In fact the current depression appears to have had little effect in curtailing great dam constructions.

The final concrete was placed in the Owyhee Dam on May 28 and on July 17 this great arch-gravity structure was dedicated by the U. S. Bureau of Reclamation. Five hundred and thirty ft. high, it will hold the record as the highest dam in the world until the completion of the Hoover Dam of the Boulder Canyon Project.

Progress on the Hoover Dam during the year has been most satisfactory and the conditions uncovered by the construction to date indicate that no foundation difficulties are to be expected. Indeed the first stage of the construction was completed on November 13 when the flow of the Colorado River was turned through the two bypass tunnels on the Arizona side, almost a year ahead of the contract schedule. This was possible due to the phenomenal progress made in driving and lining these tunnels. Indeed the technical press during the year has been filled with accounts not only of the construction of Boulder City, with its accommodations for the construction workers on the great dam, of the great gravel and sand plant which will finish the aggregates for the  $4\frac{1}{2}$  million cubic yards of concrete to be used in the dam, of the concrete-mixing plant, the largest and most complete ever built, but technical writers have also described in detail the diversion tunnel construction.

The four diversion tunnels, circular in section, 56 ft. in diameter, and lined with concrete 3 ft. thick constituted a most extraordinary tunneling operation. Top headings, 12 ft. by 12 ft. in section, were first driven. A unique steel drilling frame, mounting 30 drills on five bars, the whole mounted on an auto-truck body, was then used in drilling the huge bench enlargement, 56 ft. wide and 28 ft. high. Two set-ups of this frame, one on each side, completed the 110 holes for the  $17\frac{1}{2}$  ft. round in an average time of  $2\frac{1}{2}$  hours. After blasting, the 1000 cubic yards of rock brought down were loaded by a  $3\frac{1}{2}$  yard electric shovel, into motor trucks which carried it to muck piles along the canyon walls. Finally the semi-circular invert lift, 14 ft. deep, was taken out and tunnel lining began.

The excellent and sound character of the rock encountered in these tunnel excavations assures the safety of the dam abutments. Furthermore, excavation already under way in the river bed for the upper cofferdam, indicates that the river fill of gravel, boulders, and silt, should give no trouble in the deep excavation which must be made for the foundations of the great dam itself. The material so far encountered stands well and appears to be reasonably impervious to water.

Two floods, one in the spring and one in the

fall, broke into the tunnels but delayed work only for a few days. Unless there is an extraordinary flood during later construction this great work should go forward ahead of schedule.

*The Engineering News-Record* of June 23, 1932, carried a complete description of the great Dniestrostroy Dam which has been under construction since 1927 in the Ukraine in south-central Russia. Located near Kichkas on the Dnieper River, about 200 miles from its mouth at the Black Sea, this project is both for navigation and for power. The dam is 140 ft. high and 2500 ft. long. Records showed that it would be necessary to provide for extraordinary floods and in May, 1931, when partly completed, the work was called upon to pass the greatest flood on record at this site—the huge volume of 835,000 cu. ft. per second. Accordingly the construction force was increased to a maximum late in 1931 of 25,000 men and women so as to complete the dam before the spring floods of 1932. These floods, however, did not reach the previous figure, a maximum of 500,000 being recorded.

The Dniestrostroy project has been designed and the construction directed by the veteran American hydraulic engineer, Hugh L. Cooper. The turbine units installed are the largest in the world and are capable of generating 84,000 h.p. each, under a head of 116.5 ft. and over 100,000 h.p. under the maximum head of 123 ft. A flight of three locks is provided for navigation.

Following the abandonment of the San Gabriel Dam site at the Forks, the Los Angeles Flood Control and Water Conservation Commission prepared plans for two other dams in the San Gabriel Valley. After the low bidder had refused to sign a contract, new bids were called for and construction was under way on Dam No. 2, located on the West Branch about 9 miles above the old Fork site. This is to be a rock fill dam, 265 ft. high above stream bed.

Unfortunately, it has been impossible to secure acceptable bids for Dam No. 1, which is to be built about two miles below the old site. This is also designed as a rock-fill dam but only one bid was received when bids were called on August 1. Since then plans have been revised but a second bidding was also unsuccessful. After a final revision new bids have again been called for. The structure will be higher and larger than Dam No. 2 and will be the fifth large dam under construction in this part of the country. The others are as follows:

Pine Canyon Dam, also in the San Gabriel Valley, is a 245-ft. high (325 ft. above foundations) gravity dam with a crest length of 750 ft. It is being built for the Pasadena, Calif., water supply and is to be taken over by the metropolitan district of which Pasadena is a member upon the completion of the Colorado River aqueduct.

The El Capitan Dam for the water supply of San Diego, Calif. is to be an hydraulic fill dam, 220 ft. high above foundations, with a heavy stone facing on the upstream side. Excellent progress has been made in cleaning the site and constructing the concrete cut-off diaphragm.

The Bouquet Canyon Dam, 50 miles north of Los Angeles, is being built by the Los Angeles department of water supply and power to replace the storage lost when the St. Francis dam failed, several years ago. This is a rolled earth em-

bankment, 215 ft. high, with a reinforced concrete facing on the upstream slope.

While none of these dams set new records they are notable works of their type. In fact, the Bouquet Canyon Dam may possibly be a record structure for rolled fill.

Two other dams on the West Coast should be noted. There is under construction on the Lewis River, 32 miles north of Portland, Ore., an arch dam, 313 ft. high. This dam, known as the Ariel Dam, is a notable structure of this type. It is particularly important that arch dams form solid, continuous walls in order that the arching action, basic to the design of the dam, may be brought into full play. Concrete shrinks in setting and such dams are usually built in sections. Special arrangements are therefore necessary to fill the joints between sections after the concrete has set and the structure has contracted. Thus in the Pardee Dam, 358 ft. high, completed in 1929 for the water supply of the San Francisco area, continued cooling and shrinkage of the structure has made a second pressure grouting of the construction-and-contraction joints necessary.

On the Madden Dam, now under construction on the Chagres River for additional water supply and flood control on the Panama Canal, the first concrete was placed in August and excellent progress was reported until November 28 when an unexpected flood interrupted the operations. The rock conditions at the Madden dam site present unusual difficulties. Extensive borings have shown large caverns and pockets in the otherwise sound limestone encountered in part of the work. These are being filled by forcing in liquid clay under pressures running up to 300 lbs. per square inch.

A record dam of the Ambursen, or slab and buttress type is the Roderiquez Dam in Mexico. This dam (see YEAR BOOK, 1930) is to be 187 ft. high above stream bed and 240 ft. above lowest foundations. Work was abandoned late in 1931, due to financial difficulties, when the dam was about 35 per cent completed. It is understood that construction has again been going forward during the past year.

As the year comes to a close there are reports that the Austin (Texas) Dam, a famous dam failure of earlier days, is to be rebuilt. It should also be recorded that satisfactory progress has been made in increasing for the second time, the height of the famous Nile Dam at Aswan.

**DAN, TAKUMA, BARON.** A Japanese financier, died by assassination in Tokyo, Mar. 5, 1932. He was born in Fukuoka in 1858 and received his education in the United States, attending the Massachusetts Institute of Technology. For several years after his return to Japan he taught English in the government schools and then became technical official at the Government Meteorological Observatory and at the Miike Coal Mine. On the purchase of the latter by the Mitsui Gomei Kaisha about 1900 he entered the service of that organization, and after 1910 was general managing director of its vast trading interests, which were said to handle more than one-third of Japan's import and export trade. The numerous subsidiaries of this holding company covered nearly every field of economic activity, including banking, mining, real estate, manufacturing, and transportation. As chairman of the board of directors of the Mitsui Bank and president of the mining companies financed by that institution,

he was one of the most powerful Japanese financiers. In 1921 he headed a Japanese mission to the United States in an effort to promote business relations between the two countries. His assassin's motive was partly political in that he believed the alleged corrupt political parties could be destroyed by destroying the financiers who supported them. See JAPAN under *History* for political background.

**DANA'S TEXT BOOK OF MINERALOGY.** See MINERALOGY.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANUBIAN UNION.** See UNITED STATES OF EUROPE; AUSTRIA and HUNGARY under *History*; PEACE.

**DANZIG, dän'ts'ik, FREE CITY OF.** A Baltic port, occupying a strategic position at the mouth of the Vistula River, which, with its surrounding territory, was established as a free city on Nov. 9, 1920, under the terms of the Treaty of Versailles. It was formerly a part of the German Empire. Area, about 754 square miles; 1920 population, 407,629, of whom 235,237 were in the city proper. The population in 1929 was 95 per cent German and less than 5 per cent Polish. German is the official language. Of the 1924 population, 222,868 were Protestants, 140,797 Roman Catholics, and 9239 Jews. In 1929, there were 44,632 children in elementary schools, 3228 in middle schools, and 6207 in high schools.

Danzig is advantageously situated with relation to the great Polish, German, and Russian grain districts and has been the chief outlet for the foreign commerce of Poland, which exercises joint control with the Free City of the harbor administration. The territory is also within the Polish Customs administration. Traffic through the port in 1931 amounted to 8,331,503 metric tons. The prosperity of Danzig was adversely affected by the growth of the new Polish port of Gdynia (see POLAND under *Communications*) and by the establishment of Polish government agencies for the direct sale of Polish exports and the direct purchase of such Polish imports as potash salts and nitrates.

A total of 5959 vessels of 4,061,733 net registered tons arrived at Danzig during 1931, and 5432 vessels of 3,719,988 net registered tons cleared. With the aid of a short-term loan, reduced expenditures, and higher taxes, the budget for the fiscal year ended Mar. 31, 1931, was balanced at 142,896,050 gulden. Four main railway lines connect Danzig with important German cities, while three other main lines run to leading Polish cities. Air lines link the port with various German and Polish points.

Danzig is under the protection of the League of Nations, which appoints a High Commissioner to settle disputes between the Free City and Poland. Foreign relations are controlled by Poland, but the Free City exercises a veto power. The Constitution, as approved by the League of Nations May 11, 1922, vests executive power in the President of the Senate, which is the highest state authority. A Diet of 72 members elected for four years by universal suffrage elects the members of the Senate and its President. The composition of the Diet elected Nov. 16, 1930, was: Social Democrats, 19; National Socialists (Hitlerites), 12; Centrists, 11; National Germans, 10; Communists, 7; National People's party, 3; other parties, 10. President of the Senate in 1932, Dr. Ernst Ziehm, elected Jan. 13,

1931. Count Manfredi Gravina, High Commissioner of the League of Nations in Danzig, died in September, 1932 and was succeeded in November of that year by H. R. G. Rosting (of Denmark). See POLAND under *History*.

**DARTMOUTH COLLEGE.** A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1932 autumn session had an enrollment of 2371 students, most of whom were working for the B.A. degree, the exceptions being 15 graduate students, 38 students in the medical school, 21 in the Thayer School of Civil Engineering, and 104 in the Tuck School of Administration and Finance. There were 290 members on the faculty. The endowment amounted to \$16,500,000, while the income for the year was \$730,000. The Fisher Ames Baker Memorial Library contained 351,902 volumes. President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

**DATE SCALE ERADICATION.** See ENTOMOLOGY, ECONOMIC.

**DEATH RATE.** See VITAL STATISTICS.

**DEBTS, PUBLIC.** See PUBLIC FINANCE; GREAT BRITAIN, FRANCE, GERMANY, ETC., under *Finance*.

**DE BUNSEN, SIR MAURICE (WILLIAM ERNEST).** A British diplomat, died in London, Feb. 21, 1932. Born Jan. 8, 1852, he attended Christ Church College, Oxford, and in 1877 entered the diplomatic service as an attaché at Washington. He served successively between 1879 and 1894 as third secretary, second secretary, and secretary of the British legation in Tokyo. In 1894 he was made consul-general at Bangkok, Siam, and in 1897 secretary of the British embassy at Constantinople. In 1902 he was transferred to Paris as secretary of the embassy and minister plenipotentiary, and in 1905 was stationed in Lisbon as British envoy extraordinary and minister plenipotentiary. He was British ambassador to Madrid during 1906-13 and to Vienna during 1913-14. At the latter post he played an outstanding part in the crisis previous to the declaration of war in August, 1914. In 1918 he visited the South American countries as head of a British mission, and previous to his retirement in 1919 was created a baronet.

**DEFECTIVES.** See CHILD WELFARE.

**DELAWARE. POPULATION.** According to the Fifteenth Census the population of the State on Apr. 1, 1930, was 238,380, as against 223,003 in 1920. Wilmington, the chief city, had (1930) 106,597 inhabitants; Dover, the capital, had 4800.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops for 1932 and 1931:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1932	147,000	4,263,000	\$1,279,000
	1931	146,000	4,745,000	1,851,000
Wheat	1932	79,000	908,000	472,000
	1931	91,000	2,188,000	1,069,000
Hay	1932	76,000	117,000*	1,070,000
	1931	65,000	109,000*	1,184,000
Sweet potatoes	1932	7,000	826,000	322,000
	1931	8,000	1,400,000	560,000

\* Tons.

**MINERAL PRODUCTION.** The relatively slight mineral production of the State attained the total of \$424,901 for 1930; for 1929, of \$467,493. It was made up in large part of clay products, under the classification of brick and tile, of which the total value was \$157,391 for 1930 and \$230,441 for 1929. Apart from clay thus used, there

was some extraction of raw clay. Stone, sand, and gravel, largely for local demand, made up most of the remainder of the yearly mineral total.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments, \$6,286,688 (of which \$1,886,419 was for local education); for interest on debt, \$175,165; for permanent improvements, \$4,653,379; total, \$11,115,232 (of which \$3,022,926 was for highways, \$273,147 being for maintenance and \$2,749,779 for construction). Revenues were \$14,852,049. Of these, property and special taxes furnished 66.8 per cent; departmental earnings and compensation to the State for officers' services, 4.8; sale of licenses, 16.9 (in which was included a gasoline sale tax that produced \$1,035,879). Funded debt outstanding on June 30, 1931, totaled \$3,740,785, of which \$2,905,000 was for highways. Net of sinking-fund assets, the debt was \$3,240,367. The State levied in the year no general ad-valorem taxes on property.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 325.12.

**EDUCATION.** It was reported at the end of the year that the schedules of teaching salaries had been maintained throughout the public schools in the State, but that the automatic increases in salaries had taken place only in some cases. The estimated number of persons of school age in the State in 1932 was 53,150. There were enrolled in the public schools 44,289 pupils. Of these, 27,886 were in grades up through the sixth, and 16,393 were in higher grades, through the twelfth. The expenditures of the year for public-school education totaled \$6,506,583, of which \$3,908,413 was current expenditure. Salaries of teachers averaged, by the year, \$1550.

**CHARITIES AND CORRECTIONS.** The State Board of Charities, under the system in force in 1932, exercised the central powers of the State in the supervision of institutions of care and custody, either conducted or supported wholly or partly by the State or its subdivisions. The Board held the power to authorize the sterilization of institutionalized mental defectives and of habitual criminals on application from authorities having direct charge of such persons. It supervised the bringing, into the State, of dependent children. The Board was composed of five unremunerated appointee members, serving terms of four years, and of the Governor, *ex officio*. Three of its members were required to be appointed from the respective counties of the State and two at large; two of the five were required to be women.

A State Board of Health, beside exercising the usual functions of such a body, administered two State institutions for tuberculosis Brandywine Sanatorium (whites), at Faulkland, and Edgewood Sanatorium (colored), at Marshallton. The Delaware State Hospital, established by statute to care for the insane, operated through State support, under a board of trustees, and harbored some 700 patients. A system of county jails and workhouses was maintained, but the State had a Board of Parole, empowered to grant and revoke paroles, and a Board of Pardons, to recommend cases to the Governor, for pardon, reprieve or commutation. Institutions for juvenile delinquents, other than private institutions, were the Ferris Industrial School (boys), at Marshallton, harboring some 260

boys; Delaware Industrial School for Girls, at Claymont; Industrial School for Colored Girls, at Marshallton.

**ELECTIONS.** The popular vote of the State on November 8 favored the Republican National ticket. Hoover (Rep.) received 57,073 votes for President; for Roosevelt (Dem.), 54,319. C. Douglas Buck, Republican, the incumbent Governor, was reelected, defeating Landreth L. Layton, the Democratic candidate. A Democrat, Wilbur L. Adams, was elected to the State's seat in the House of Representatives of the Seventy-third Federal Congress.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, C. Douglass Buck; Lieutenant-Governor, J. Henry Hazel; Treasurer, George S. Williams; Auditor, Edward Baker; Secretary of State, Charles H. Grandland; Attorney-General, Reuben Satterthwaite, Jr.

**Judiciary:** Chancellor, Josiah O. Wolcott; Chief Justice of Supreme Court, James Pennewill; Associate Justices of Supreme Court, Richard S. Rodney, Herbert L. Rice, William Watson Harrington, Charles S. Richards.

**DELAWARE, UNIVERSITY OF.** An institution of higher learning in Newark, Del., founded in 1833. The enrollment in 1932-33 was 784, of whom 493 were men and 291 were women. The enrollment in the 1932 summer session was 443. The faculty numbered 124 members, 93 of whom were on the regular teaching staff, the others being members of the experiment station and extension staff. Appropriations from the State and Federal governments amounted to approximately \$445,330; invested endowment funds amounted to \$604,360. The library contained approximately 64,000 volumes. President, Walter Hüllihen, Ph.D., D.C.L., LL.D.

**DEMERARA.** The name of a county of British Guiana, sometimes incorrectly used to designate the entire colony. See **BRITISH GUIANA**.

**DE MOLAY, ORDER OF.** A nonsectarian secret organization for young men between the ages of 16 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templars. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The order is governed by a grand council of Freemasons, while the chapters are sponsored by Masonic bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1932, there were about 160,000 members and more than 350,000 former members in 1300 cities of the United States, Alaska, Hawaii, Puerto Rico, the Philippines, Canada, Mexico, Chile, and Panama. There were three chapters in the U. S. Navy, namely, Battle Fleet, Admiral Dewey, and Asiatic, with membership confined solely to sailors. The official organ is *International De Molay Cordon* (monthly). Frank S. Land, the founder, is grand scribe; Dr. Stratton D. Brooks, former president of the Universities of Oklahoma and Missouri, is executive director. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

**DENISON UNIVERSITY.** A coeducational Baptist institution of higher education in Granville, O., founded in 1831. The enrollment for the

autumn of 1932 was 855, and for the summer of 1932, 152. The faculty numbered 63. The amount of endowment was \$3,280,700; the income for the year was \$336,300. There were 72,800 volumes in the library. The university was the recipient of a \$15,000 grant from the Carnegie Corporation to be used for new books for the library. This amount is to be spread over a period of three years. The President is Avery Albert Shaw, A.M., D.D., D.C.L., LL.D.

**DENMARK.** The smallest of the three Scandinavian states; comprising the peninsula of Jutland with adjacent islands in the Baltic, the Faroe Islands, and a part of Schleswig. The King of Denmark is also head of the government of Iceland (q.v.). Capital, Copenhagen. King in 1932, Christian X.

**AREA AND POPULATION.** With an area of 16,576 square miles, excluding the Faroe Islands (area, 540 square miles), Denmark had a population in 1931 estimated at 3,566,000, compared with 3,550,651 at the census of 1930, and 3,267,831 in 1921. For the five years 1927-31, births averaged 66,488 annually and deaths 35,387; the birth rate per 1000 of the population averaged 18.9, and the death rate 11.2. Emigrants in 1931 numbered 1186, compared with an average of 6101 annually for the years 1927-31. The population of the leading cities in 1930 and 1925 was: Copenhagen (København), 771,168 (731,406 in 1925); Aarhus, 81,279 (76,226); Odense, 56,759 (52,376); Aalborg, 44,365 (42,819).

**EDUCATION.** Primary education is free and compulsory between the ages of 7 and 14. On Jan. 1, 1930, there were 494,883 pupils attending elementary schools and 50,118 attending secondary schools. The enrollment in all divisions of the University of Copenhagen averages about 4700; in the University of Aarhus, about 100.

**PRODUCTION.** Danish economy is based chiefly upon agriculture and dairying, and farm products account for about three-fourths of the value of all exports. In 1931 and 1932 foreign markets for these exports were impaired by the general decline in purchasing power and the increase in tariffs, particularly by the Ottawa Agreements which curtailed the British market. About 66 per cent of the total area, or 7,000,000 acres, was under cultivation. Livestock in 1931 included 3,197,000 cattle, 5,435,000 swine, and 498,000 horses. In the same year there were slaughtered 654,000 cattle and calves, and 50,000 sheep and goats. Production of butter (1931) was 378,000,000 pounds (373,000,000 in 1930); of bacon, 820,000,000 pounds (874,000,000). The chief crops in 1931 were: Wheat, 9,921,000 bushels; rye, 8,661,000 bushels; barley, 44,553,000 bushels; oats, 64,761,000 bushels; potatoes, 33,069,000 bushels; sugar beets, 11,300 metric tons; forage roots, 22,050,000 metric tons. The turnover of Danish coöperative societies declined from 1,929,000,000 crowns in 1930 to 1,673,000,000 crowns in 1931 (crown equals \$0.2680 at par).

Most of the world's motor ships are built in Danish yards; in 1931 motor ships comprised 116,000 tons out of 126,000 gross tons of shipping built in Denmark. Food products, cigars and cigarettes, cotton yarn, cotton cloth, cement, bricks, paper, oils, and varnishes are other leading products. Of about 295,384 organized workers in 1931, an average of 53,019 were unemployed. On June 30, 1932, there were about 80,000 registered unemployed.

**COMMERCE.** Due to lower prices and re-

stricted markets, Danish foreign trade declined from 1929 through 1932. Imports in 1931 totaled 1,465,000,000 crowns (\$368,050,000), against 1,729,000,000 crowns (\$463,409,000) in 1930. Exports totaled 1,257,000,000 crowns (\$316,862,000), compared with 1,524,000,000 crowns (\$408,341,000) in 1930. Iron and steel, fabrics of vegetable fibre, mineral oils, coal, fertilizers, and automobiles were the chief imports, in order of value, in 1931, while pork, bacon, and butter were the principal exports. Germany in 1931 took 13.5 per cent of all exports (by value), Sweden and Norway, 11.5 per cent; and the United Kingdom, 56.1 per cent. Germany furnished 33.6 per cent of the total imports by value; the United Kingdom, 15.1 per cent; and the United States, 10.3 per cent. United States statistics for 1931 showed exports to Denmark of \$29,748,000 (\$40,243,000 in 1930) and imports from Denmark of \$1,881,000 (\$3,181,000 in 1930).

**FINANCE.** Budget operations for the fiscal year ended Mar. 31, 1932, closed with a surplus of 89,000 crowns, as against an anticipated deficit of 5,000,000 crowns, and a surplus of 25,000,000 crowns for the preceding year. Indications were that the 1932-33 budget would balance also. The budget estimates for 1931-32 placed revenues at 330,589,000 crowns and expenditures at 326,823,000 crowns. The total debt as of Mar. 31, 1930, was 1,354,931,000 crowns (\$363,122,000), of which the internal debt comprised 637,005,000 crowns, and the external debt 717,926,000 crowns. Denmark abandoned the gold standard on Sept. 28, 1931. The crown (krone), par value \$0.2680, exchanged at \$0.2676 in 1930, \$0.2506 in 1931, and \$0.1673 in the week of Dec. 5-10, 1932.

**COMMUNICATIONS.** Railway lines in operation Mar. 31, 1931, extended 3290 miles, of which 1563 miles belonged to the state and 1727 miles to private companies. The government lines in 1931 reported gross receipts equivalent to \$30,557,000, and the private lines receipts equivalent to \$6,640,000. A bridge for the state railways connecting the mainland with the Baltic Sea island of Fyen (Funen) was under construction in 1932. Highways extended about 32,060 miles. The addition of 25 new vessels to the Danish merchant fleet during 1931 brought the total to 1,215,000 gross tons. Gross freight earnings, exclusive of coastwise shipping, were \$40,096,000 in 1931 and \$46,000,000 in 1930. Sixty vessels of 234,000 tons were idle on Nov. 22, 1932. The only commercial air line in 1932 reported a flight distance of 160,357 miles, with a total of 4985 passengers, 49,005 pounds of freight, and 53,133 pounds of mail.

**GOVERNMENT.** The Constitution as amended Sept. 10, 1920, vests executive power in the King, who acts through a responsible ministry. Legislative power is vested in the Rigsdag (Parliament), composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 140 members, of whom 117 are elected on the basis of proportional representation; the Landsting has 75 members, elected indirectly by voters over 35 years of age. For the composition of the Rigsdag and of the Cabinet following the 1932 elections, see *History*.

**HISTORY.** Premier Theodore A. M. Stauning's coalition government, formed by the Social Democratic and Radical parties in 1929, was returned to office in the elections to the Folketing on Nov. 16, 1932. The standing of the parties in the new

Folketing, with the previous standing in parentheses, was: Social Democrats, 62 (61); Radicals, 14 (16); Liberals, 38 (44); Conservatives, 27 (23); Justice League, 4 (3); Communists, 2 (0); Slesvig party, 1 (1); Faroe Islanders, election of Dec. 12, 1932, 1 (1). Elections to fill part of the seats in the Landsting, held September 7, gave the Conservatives one additional seat at the expense of the Radicals. The new lineup was: Government parties, 35; Opposition parties, 41.

The chief issue in the Folketing election was the action of the Landsting in rejecting (October 27) a government bill for extension of foreign exchange control for 18 months and for the transfer of this control from the National Bank to the Ministry of Commerce. The government parties renewed their previous demands for the abolition of the Landsting, asserting that that "reactionary" body was constantly vetoing bills passed by the Folketing and approved by the majority of the Danish people. The Opposition groups attacked the government primarily on the ground that it had granted too many trade concessions to Great Britain without adequate compensation.

Following the government's victory, the exchange control law was extended for one year by both Houses of the Riksdag on December 6. Largely due to control of the exchange, a favorable balance of trade was indicated by preliminary returns for 1932, as compared with the 1931 import surplus of 88,400,000 crowns. In the latter part of 1932, Great Britain, Germany, France, the Netherlands, and Belgium all restricted their imports of Danish agricultural produce, with disastrous effects upon Danish agriculture and industry. The government estimated that in December, 1932, 35.6 per cent of the registered working population of 310,757 were unemployed, as against 22.1 per cent a year earlier.

The question of farm relief, which had replaced disarmament as the outstanding political issue during 1931, became more acute in 1932. In two years, butter prices in Copenhagen had dropped 28 per cent; bacon, more than 60 per cent; eggs, 33 per cent. The net return on farm capital declined from 6 per cent in the post-war years to less than 1 per cent in 1930-31 and was still lower in 1931-32. The government continued its efforts to ameliorate the condition of agriculture. On Jan. 7, 1932, the Folketing passed a law establishing a partial moratorium on farm obligations for one year. Legislation giving unemployed workers a 10 per cent rebate on many food and other commodities was passed late in February, and a measure was introduced to raise more than \$5,000,000 in new taxation for unemployment relief. Several of these measures were modified or rejected in the Landsting. The Premier, renewing his attack on that body, declared that the time was approaching when the state must assume responsibility for the planning and management of the entire economic system. For the controversy with Norway over Greenland, see GREENLAND. Also see GREAT BRITAIN under *History*; POLAR RESEARCH.

**DENTAL NUTRITION.** See FOOD AND NUTRITION.

**DENVER, UNIVERSITY OF.** A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn of 1932 totaled 2323, distributed as follows:

Graduate school, 223; college of liberal arts, 949; school of science and engineering, 122; school of commerce, accounts, and finance, 439; school of law, 66; school of dentistry, discontinued; school of art, 120; school of librarianship, 33; city college, 236; extension and correspondence, 164. The summer session in 1932 totaled 910. The faculty had 181 members. The total assets of the university amounted to \$4,192,409 and consisted of plant assets, \$1,737,310; endowment assets, \$2,298,571; and current assets, \$180,529. The total income for the year was \$513,509. The library contained 75,000 volumes. Chancellor, Frederick M. Hunter, Ed.D., LL.D.

**DEPAUW UNIVERSITY.** A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church founded in 1837. The enrollment for the autumn session of 1932 was 1581, including 1012 men and 569 women. Of this number, 1481 were registered in the college of liberal arts and 100 in the school of music. The college of liberal arts had a faculty of 95 members and the school of music a faculty of 15. The productive funds of the university amounted to \$5,343,355, including assets of \$2,206,720 of the Rector Scholarship Foundation. The income from productive funds was \$267,903, while the total current income for the year was \$651,015; \$102,247 of the income from productive funds was for scholarships. The total amount of gifts for permanent funds received during the year was \$55,700. The library contained 75,773 volumes. President, G. Bromley Oxnam, D.D., LL.D., Litt.D.

**DEPRESSION.** See BUSINESS REVIEW; BANKS AND BANKING; FINANCIAL REVIEW; TAXATION; articles on basic industries, such as COTTON, IRON AND STEEL, SUGAR; and sections on *Commerce, Finance, and Production* in articles on various countries, such as GERMANY, GREAT BRITAIN, FRANCE, UNITED STATES, etc.

**DERBY.** See RACING.

**DESIGN, NATIONAL ACADEMY OF.** See NATIONAL ACADEMY OF DESIGN.

**DETROIT, UNIVERSITY OF.** An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers, founded in 1877. In the autumn of 1932 there were 2731 students registered, distributed as follows: Arts and Sciences, 448; Engineering, 530; Commerce and Finance (Day), 285; Law, 185; Dentistry, 46; Commerce and Finance (Evening), 255; Foreign Trade (Evening), 16; Thursday-Saturday School, 531; Minor Executive Course, 50. The Summer School registration was 385. The faculty numbered 162. The income in 1931-32 was \$525,132. There were 79,199 volumes in the library. President, Rev. Albert H. Poetker, S.J., Ph.D.

**DETROIT INSTITUTE OF ARTS.** See ART MUSEUMS.

**DICKINSON, ANNA ELIZABETH.** An American lecturer, author, and actress, died in Goshen, N. Y., Oct. 22, 1932. Born in Philadelphia in 1842, she became prominent through her fiery addresses on total abstinence, abolition, politics, and woman suffrage. In the '70's she turned to playwriting, her more successful productions being *A Crown of Thorns*, in which she herself played; *Mary Tudor*; *Aureliano*; and *An American Girl*. She published also *What Answer?* (1868), in which she gave her views on racial

marriages, and *Opinions* (1879). She retired to private life in 1896.

**DICKINSON, G(OLDSWORTHY) LOWES.** A British author, died in London, Aug. 3, 1932. Born in 1860, son of the well-known artist, Lowes Dickinson, he was educated at Charterhouse and at King's College, Cambridge. He became a fellow at the latter in 1887 and served as librarian from 1893 to 1896. Also, he lectured in history at King's College and at the London School of Economics and Political Science. His early writings were marked by a skillful use of the Socratic dialogue as a literary form, outstanding examples being *The Greek View of Life* (1890); *From King to King: The Tragedy of the Puritan Revolution* (1891); and *The Meaning of Good* (1906). Among his historical works are: *Revolution and Reaction in Modern France* (1892); *The Development of Parliament during the Nineteenth Century* (1895); and *An Essay on the Civilization of India, China, and Japan* (1914). In the field of religious and philosophic criticism he published: *Religion: A Criticism and a Forecast* (1905); *A Modern Symposium on Philosophic Schools of Thought* (1905); *Justice and Liberty* (1908); *Is Immortality Desirable?* (Howard Ingersoll lecture, 1909); and *Religion and Immortality* (1911). His anonymous *Letters from a Chinese Official* (1903; in England, 1901, called *Letters of John Chinaman*), in which he criticized the crudities of Western civilization, were answered by William Jennings Bryan, who took seriously the Chinese authorship, in his *Letters to a Chinese Official* (1906). He was also an authority on international relations, his works in this field including *The European Anarchy* (1916); *The Choice before Us* (1917); *The Magic Flute* (1920); *War: Its Nature, Cause, and Cure* (1923); *The International Anarchy, 1904-14* (1926); and *After Two Thousand Years* (1930).

**DIPPEL, ANDREAS.** An American singer, died in Los Angeles, Calif., May 12, 1932. He was born in Cassel, Germany, Nov. 30, 1866, and studied voice in Berlin, Milan, and Vienna, making his debut in 1887 in Bremen as the pilot in *The Flying Dutchman*. Afterwards he sang in opera in London, Breslau, Vienna, and Bayreuth. During 1890-92 he toured the United States and for one season sang at the Metropolitan Opera House in New York City. He was with the Imperial Court Opera in Vienna during 1893-98, then returned to the United States, and was identified with the Metropolitan Opera Company, New York, until 1910. During 1908-10 he was also joint director, with Giulio Gatti-Casazza, of the Metropolitan Opera Company. In 1910 he organized the Chicago Grand Opera Company, of which he was general manager until 1913. In 1914 he was impresario of a comic opera company, producing the better class of light operas and operettas. Other operatic ventures, however, won only temporary success. In 1928 he went to Hollywood where he was connected with the synchronization department of the Metro-Goldwyn-Mayer studio.

**DISARMAMENT.** The General Conference for the Reduction and Limitation of Armaments opened at Geneva on Feb. 2, 1932, under the presidency of Arthur Henderson. Giuseppe Motta (Switzerland) was elected honorary President.

Delegations were sent by 59 states, namely: Afghanistan, Albania, Argentina, Australia, Austria, Belgium, Bolivia, Brazil, British Empire, Bulgaria, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, Egypt, Ethiopia, Estonia, Finland, France, Germany, Greece, Guatemala, Haiti, Hejaz, Honduras, Hungary, India, Irish Free State, Italy, Japan, Latvia, Liberia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Panama, Persia, Peru, Poland, Portugal, Rumania, Siam, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Union of Soviet Socialist Republics, United States of America, Uruguay, Venezuela, and Yugoslavia. The Dominican Republic sent observers.

In his opening speech Mr. Henderson emphasized the unique importance of the Conference, and defined its task as follows:

(a) To arrive at a collective agreement on an effective programme of practical proposals speedily to secure a substantial reduction and limitation of all national armaments;

(b) To determine that no armaments should be maintained outside the scope of the treaty by which all nations represented at the Conference would make the achievement of universal disarmament their common aim; and

(c) To ensure continuity of advance in disarmament, without detracting in any way from the fullest measure of success of the minimum effort of the Conference, by arranging for similar conferences to meet at reasonably short intervals of time.

Mr. Henderson concluded in the following terms:

The problem of disarmament is vitally relevant to the grave economic and financial crisis for which most nations are at the moment trying to find a solution. The financial burden of armaments and of past wars, indeed, is one of its main contributory causes. It is one of the principal causes of unbalanced budgets in a large number of countries. . . .

World opinion demands that every effort be made at this Conference to achieve a substantial reduction of this prodigious expenditure. This is not merely because such expenditure is entirely unproductive, but also because even the maintenance of armaments on their present level constitutes a menace to the peace of the world. . . .

The general discussion opened February 5 and continued until February 24, during which time 50 speakers presented their respective national viewpoints. André Tardieu, head of the French delegation, on February 5 proposed the creation of a small League army, to be supplemented in time of need by national contingents. Bombing planes would be exclusively in League hands, and other aggressive weapons would be placed at the League's disposal. The British Foreign Secretary, Sir John Simon, on February 8 set forth a plan for a 25 per cent voluntary naval cut, including the abolition of submarines and limitation of tonnage and armament. Hugh S. Gibson, the American delegate, on the following day presented a nine-point programme for armament reduction and Chancellor Brüning, for Germany, demanded the universal reduction of armaments to the limits imposed upon Germany by the Versailles Treaty. The Soviet representative, Maxim Litvinov, urged (February 11) a 50 per cent reduction in the peace time military forces, if over 200,000 men, and a proportional reduction in the forces of states with smaller standing armies.

An analysis of the various proposals and statements made during this stage of the Conference showed that 14 countries supported the abolition of heavy long-range artillery; 11 favored abolition of tanks; 13 abolition of bombing aircraft; 7 abolition of all military aircraft; 7 abolition of capital ships; 6 abolition of aircraft carriers; 10 abolition of submarines; 26 prohibition of chemicals and bacteriological arms; and 8 the prohibition of all preparation or manufacture of chemical products which might be employed in time of war.

The general Conference took the next step on March 15 by voting for "moral" disarmament and appointed a General Commission of representatives of 21 nations to formulate definite methods of procedure.

The General Commission met on February 24 and appointed Dr. Benes (Czechoslovak) as *rapporteur*. It considered the method to be adopted in studying the proposals referred to it by the Conference. Two draft resolutions were deposited, one by Sir John Simon (Great Britain), the other by M. Litvinov (Soviet Union). The text recommended by Sir John Simon read as follows:

The General Commission resolves to carry on its discussions within the framework of the Draft Disarmament Convention, full liberty being reserved to all delegations to develop their own proposals in subsequent debate and to move their amendments in the form of modifications, additions or omissions at the appropriate point.

That recommended by M. Litvinov was in part:

Believing that the only effective means of contributing to the organization of peace and the establishment of security against war is the general, complete and rapid abolition of all armed forces, setting out from the principle of equality for all,

Convinced that the idea of general and complete disarmament answers to the sincere aspiration of the masses towards peace,

The Conference decides to base its work on the principle of general and complete disarmament.

On February 25 the Commission unanimously adopted Sir John Simon's original text. The Commission which had adjourned for the Easter recess, reassembled at Geneva from April 11 to 26. In accordance with its decision of March 16, it began by discussing, from April 11 to 13, the general principles involved in Article I of the draft Convention. This Convention had been drawn up by the Preparatory Disarmament Commission after five years of study and deliberation, ended in December, 1930. It was designed to provide a framework within which the limitation and reduction of armaments could be achieved.

In the course of the debate the Commission had to consider various recommendations and proposals concerning the problem of qualitative reduction of armaments. Outstanding among these was the proposal for the abolition of tanks and heavy artillery, as well as of poison gas, advanced by the American delegation (April 11), with the support of Great Britain, Italy, and others. The gist of the proposal was to make all aggressive weapons illegal. All these proposals were referred to the Bureau (of experts and technicians) of the Conference, with instructions to analyze and coordinate them. On April 18, the Commission approved the report presented by Dr. Benes on behalf of the Bureau and commenced examination of the principle of reduction of armaments: (a) by definitive reduction, under a single convention; (b) by reduction to the lowest possible

level; (c) by reduction to be brought about by stages.

On April 19 the drafting committee submitted to the Commission the following draft resolution which was unanimously adopted:

In view of the opinions expressed during the discussion at the Conference for the Reduction and Limitation of Armaments;

The General Commission considers that the reduction of armaments, as provided for in Article 8 of the Covenant of the League of Nations, should, after this Conference has taken the first decisive step of general reduction to the lowest possible level, be progressively achieved by means of successive revisions at appropriate intervals.

On April 20 the drafting committee submitted the following text:

In view of the proposals submitted by various delegations concerning the criteria for the limitation and reduction of armaments,

The General Commission declares that, in determining those criteria, the provisions of Article 8 of the Covenant of the League of Nations shall be applied and that, in consequence, armaments must be reduced to the lowest point consistent with national safety and the enforcement by common consent of international obligations.

It will be necessary, further, to take account of the geographical situation and circumstances of each State.

The General Commission decides that the application of these criteria and the methods by which the reduction and limitation of armaments must be effected should be immediately examined from a practical standpoint

This resolution was adopted, with the Union of Soviet Socialist Republics casting the only dissenting vote. On the same day the following supplementary resolution was also unanimously adopted:

In seeking to apply the principle of qualitative disarmament as defined in the previous resolution, the Conference is of opinion that the range of land, sea, and air armaments should be examined by the competent Special Commissions with a view to selecting those weapons whose character is the most specifically offensive or those most efficacious against national defence, or those most threatening to civilians.

**THE HOOVER PLAN.** While the General Commission was striving, with little success, to establish a basis for a collective agreement for the reduction and limitation of armaments, hope for any substantial accomplishment in this direction gradually diminished. Hope was revived, however, when on June 22 President Hoover submitted a plan for a general one-third reduction in military and naval forces, the abolition of all tanks, chemical warfare, large mobile guns, and bombing planes, and the prohibition of bombardment from the air. The proposal was coolly received by the French and British Governments, although warmly acclaimed by public opinion in many European countries.

The only tangible results of six months' labor of the Conference were set forth in a resolution drafted by M. Benes in private conversations with delegates of the United States, Great Britain, and France, and adopted by the Conference on July 23. It reaffirmed the determination "to achieve a first decisive step" toward disarmament and declared that the Conference

Decides forthwith and unanimously, guided by the general principles underlying President Hoover's declaration.

That a substantial reduction of world armaments shall be effected to be applied by a general convention alike to land, naval, and air armaments,

That a primary objective shall be to reduce the means of attack.

**GERMANY'S WITHDRAWAL.** The failure of the resolution of July 23 to incorporate the German demand for armament equality caused the Ger-

man delegation to give notice that it could not "undertake to continue its collaboration if a satisfactory solution of this decisive point for Germany is not reached by the time the Conference resumes its work." The General Commission adjourned for its summer recess August 29. A month later, the German Foreign Minister proposed to France that the two countries enter into a confidential discussion in an effort to reach an understanding on the equality issue. The conditions laid down by Germany, were considered by the French equivalent to a proposal for rearmament and the French government declined to enter into discussions (September 12). The French note denied Germany's right to repudiate or modify Part V of the Versailles Treaty by unilateral action, as had been advocated.

On September 18 the British government made public a memorandum severely condemning Germany for raising the equality issue at that time and supporting the French legal contention in regard to Part V of the Versailles Treaty; but the British memorandum also acknowledged Germany's moral right to equal treatment, and proposed, in general terms, a method by which this might be accomplished by incorporating a modified version of the Versailles military clauses in the general disarmament convention, to be accepted voluntarily by all powers.

Five days before the Bureau was scheduled to reassemble Germany declared in a note to the president of the Conference (September 16) that it "cannot be expected to take part in negotiations with regard to measures of disarmament to be laid down in the Conference until it is established that the solutions which may be found are also to apply to Germany." This, in effect, was a declaration that France's earlier reply, rejecting the German request to reorganize its army, was unacceptable to the von Papen government and that German cooperation at Geneva would await acceptance of the demand for equality.

On September 20, President Hoover issued a public statement asserting that revision of the Versailles Treaty was "solely a European question" but expressing a hope that Germany "will continue to participate in the Arms Conference, which has now such great promise of progress for the entire world. . . ."

When the Bureau of the Conference reconvened September 21, it was obviously impossible to make progress until the issue raised by Germany had been settled and the German delegates returned to the Conference. Accordingly, the Bureau adjourned September 26 pending a settlement of the equality issue.

**HERRIOT'S DISARMAMENT PLAN.** Diplomatic conversations in search of a formula satisfactory to Germany, France, and Great Britain continued for a month. With the Disarmament Conference Bureau scheduled to reconvene on November 3, the General Conference facing complete collapse, and France preparing to appeal to the United States for relief from the approaching war-debt installment, Premier Herriot was forced to modify the French position. On October 28 he outlined a new disarmament plan to the French Chamber of Deputies. It was presented to the Disarmament Bureau November 3 and published on November 14.

This far-reaching proposal linked the French demand for disarmament with security in a new way by extending the Locarno agreements and assuring that definite aid would be furnished by

the European states to a country attacked in violation of the League Covenant or the Kellogg Pact. The military proposals relating to the European powers, supplemented the political aspects of the plan. Their two basic objects were (1) the reduction of the offensive character of national forces, on the basis of "equality of defensive status" and (2) to place specialized national forces at the disposal of the League as a contingent for joint action against an aggressor. The home defense forces of all Continental European states were to be reduced to a uniform short-service conscript system. The principle of qualitative disarmament was endorsed and the use of heavy artillery and tanks was to be prohibited in national armies of Europe but such weapons were to be placed at the disposal of the League of Nations. The plan thus granted Germany equality of rights in so far as military effectives were concerned. It further strengthened vague provisions for collective action against an aggressor provided for in Article XVI of the League Covenant.

Negotiations between the Great Powers for a settlement of the German equality demand made progress as a result of the modification of the French stand. Early in December Prime Minister MacDonald, Premier Herriot, Foreign Minister von Neurath of Germany, and Baron Aloisi of Italy, were brought together at Geneva by Norman Davis of the American delegation. As a result of their discussions a declaration was issued December 11, signed by the representatives of all five powers, granting Germany's right to equality "in a system which would provide security for all nations" and announcing Germany's return to the Disarmament Conference on the basis of the declaration. The four European governments pledged that "they will not in any circumstances attempt to resolve any present or future differences between the signatories by resort to force" and all five powers promised to work out without delay, in cooperation with the other nations at the Geneva Disarmament Conference, "a convention which shall effect a substantial reduction and a limitation of armaments with provision for future revision with a view to further reduction."

As a result of this declaration, a meeting of the General Commission of the Conference was called for Jan. 31, 1933, to make a final effort to draft a conclusive disarmament treaty.

See GERMANY, FRANCE, GREAT BRITAIN, ITALY, the UNITED STATES, and other nations under *History*; PEACE; LEAGUE OF NATIONS; MILITARY PROGRESS; NAVAL PROGRESS.

**BIBLIOGRAPHY.** Consult "The World Disarmament Conference," *Foreign Policy Reports*, May 11, 1932, vol. viii, no. 5 and Jan. 18, 1933, vol. viii, no. 23; "Disarmament," *International Conciliation*, December, 1932, no. 285 (texts of official documents and articles by Viscount Cecil of Chelwood and Norman H. Davis).

**DISCIPLES OF CHRIST.** A communion, known also as the Churches of Christ, which sprung from a movement for Christian unity in Presbyterian circles at the beginning of the nineteenth century, under Barton W. Stone in Kentucky and Thomas and Alexander Campbell in Western Pennsylvania. In policy the churches are congregational. There are six major administrative agencies: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Pro-

motion of Christian Unity; Pension Board; and the missionary societies of the several States and provinces of Canada. These agencies are corporations and are related in an advisory way to the International Convention of the Disciples of the Disciples of Christ, which meets annually in the late summer or early autumn.

The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind. In 1932 its foreign field embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Tibet (Batang, on the border). During the year there were 6536 baptisms in the foreign fields. The 425 mission schools had a total enrollment of 16,552. The communion maintained 16 hospitals and 12 dispensaries, which gave 391,437 treatments. The church erection fund amounted to \$2,917,457. Mission work in the home field was conducted among the French mountaineers, immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The department of benevolence maintained six homes for children, six homes for the aged, and one hospital. In 1932, 29 colleges cooperated with the Board of Education.

The total church membership throughout the world in 1932 was 1,707,859, a gain over 1931 of 28,091; and in the United States and Canada, 1,572,732, a gain of 22,978. The Bible School enrollment for the world was 1,201,965, a gain over the previous year of 87,193; and for the United States and Canada, 1,129,938, a gain of 71,722. Contributions for missionary, benevolence, and educational purposes, reported for the fiscal year in the United States and Canada totaled \$3,194,614.

Among the periodicals published by the communion are the *World Call*, *Christian Evangelist*, *Christian Standard*, and *Christian Unity Quarterly*. The acting president of the International Convention in 1932 was Homer W. Carpenter of Louisville, Ky. Dr. Stephen J. Corey of Indianapolis, Ind., was president of the United Christian Missionary Society.

**DOCKS.** See PORTS AND HARBORS.

**DOGS.** As almost as many shows were held as in previous years and the entries were as large, the depression did not seem to affect the activities of the dog fanciers of the world to any great extent.

For years Mrs. M. Hartley Dodge, owner of the Giralda Farms, at Madison, N. J. has been one of the most enthusiastic dog breeders and fanciers in the country. Year in and year out she has shown her dogs in every good-sized show and has been one of the mainstays of the kennel world by holding the annual, magnificent Morris and Essex show, the largest outdoor show in the world, on her estate each summer. In 1932 she came into her own with two of the premier dogs

of the year. Her lemon-colored pointer, Nancol-leth Markable, an importation from England, stalked through the Westminster Kennel Club show at Madison Square Garden, New York City, in February to receive the award for Best-in-Show. To gain the most coveted honor in dogdom, the pointer beat out Blue Dan of Happy Valley, magnificent English setter which had been finalist to the remarkable Pendley Calling in the previous year. Nancol-leth Beryl, full sister of the champion, carried on in the summer and fall, making an extensive trip throughout the country and winning innumerable best-in-shows at Buffalo, New Orleans, Los Angeles, and elsewhere.

Field trials came more and more into prominence, numerous ones being held on Long Island and New Jersey and in the mid-West. These attracted good crowds of sportsmen and plans were accordingly made to hold more trials in the new year.

**DOLE.** See UNEMPLOYMENT; LABOR, AMERICAN FEDERATION OF; FRANCE; GREAT BRITAIN; GERMANY.

**DOLLAR, ROBERT.** An American shipping magnate, died in San Rafael, Calif., May 16, 1932. He was born in Falkirk, Scotland, Mar. 20, 1844, attended common schools there until he was 11, and then went to work in a machine shop. When he was 13 years old his father emigrated to Canada and there Robert started his career as chore boy in a Quebec lumber camp and was eventually promoted to foreman. In 1872 he began logging on his own account, but the panic of the following year caused this venture to fail. His second attempt about five years later was more successful, and in 1882 he transferred his business to Marquette, Mich. In 1888 he located in San Francisco, Calif., leasing a large tract of redwood in Sonoma Co., and operating a sawmill at Guerneville. His business expanded so rapidly that within a few years he was able to lease other large tracts of timber lands in Washington, Oregon, and California, and to establish mills that laid the foundation for the enormous lumber manufacturing industry of the Pacific coast. Difficulty in getting his product transported led to his decision in 1892 to purchase his own schooner for this purpose. A year later he had added two more vessels, the gold discoveries in Alaska at that time enabling him to charter them out for carrying miners and stores to that region. The addition of several large steamships to his fleet about 1900 enabled him to expand his shipping business still further, and to attract the Far Eastern trade. He was also a pioneer importer of products from China, Japan, and the Philippines. During the World War his company realized enormous profits by carrying out munitions and stores to Vladivostok for the Czarist Russians, bringing back Chinese coolies for the labor corps in France (shipped across Canada by rail), and after the Armistice returning these Chinese to their own country at freight 400 to 600 per cent above normal.

In 1923 "Captain" Dollar purchased from the U. S. Shipping Board seven 10,000-ton passenger steamships with which he inaugurated the first round-the-world passenger steamship service, with sailings every two weeks, calling at 22 way ports. This fleet grew to more than 40 ships, 18 of which were in the passenger service, the latest addition being the turbine-electric driven, 22,000-

ton *President Hoover* in 1930. At the time of his death he was president of the Dollar Steamship Co., Robert Dollar Co., Admiral Oriental Co., Dollar Portland Lumber Co., and the Canadian Robert Dollar Co. In connection with the latter he founded about 1922 the town of Dolar-ton, near Vancouver, where he erected one of the largest and most modern sawmills on the Pacific coast and built a church, social hall, post office, and several streets of bungalow residences for his employees. He was decorated several times by the Chinese government for his gestures of friendliness, the total of his benefactions for the erection of churches, schools, and Y. M. C. A. buildings reaching more than \$1,000,000. He was the author of *Memoirs of Robert Dollar* (1925), and *One Hundred and Thirty Years of Steam Navigation: A History of the Merchant Ship* (1931).

**DOMESTIC ARCHITECTURE.** See ARCHITECTURE.

**DOMINICA.** See LEEWARD ISLANDS.

**DOMINICAN REPUBLIC (SANTO DOMINGO).** A West Indian state occupying the eastern part of the island of Haiti, the western part of which comprises the Republic of Haiti (see HAITI). Capital, Santo Domingo.

**AREA AND POPULATION.** The area is estimated at 19,332 square miles; the population at the census of 1921 was 897,405 (estimated at 1,200,000 in 1931). The chief cities, with their estimated populations in 1929, were: Santo Domingo, 45,000; Santiago, 15,000; San Pedro de Macoris, 31,000; Puerto Plata, 9500; La Romana, 10,000. The city of Santo Domingo was destroyed by a hurricane on Sept. 3, 1930; it was being rebuilt in 1932. Of the total population, 25 per cent were white (mainly of Spanish descent), 25.4 per cent were Negroes, and the remainder were mestizos or of mixed blood. In February, 1930, there were 841 schools, of which 33 were technical, and a total enrollment of 90,366 (average attendance, 55,842), or about one-half the children of school age. In 1930, about 320,000 persons were reported as illiterate, compared with 373,000 in 1920.

**PRODUCTION.** Agriculture is the main support of the population, with sugar, cacao, coffee, rice, and tobacco as the chief crops. Of the 9900 square miles of cultivable land, about 6600 square miles are under cultivation. The 21 sugar "centrals" are controlled for the most part by American capital. Sugar production during the 1930-31 grinding season totaled 362,700 long tons (379,000 long tons in 1931-32). Rice production increased to 15,957 tons in 1931. The forests produce lignum-vitae, mahogany logs, railroad ties, and dyewoods. Sugar refining is the only important manufacturing industry, while straw hats and a few other articles are produced for local consumption. Mineral deposits, which include gold, copper, silver, petroleum, and low-grade coal, are relatively unimportant. Cacao production in 1931 was estimated at 50,000,000 pounds; coffee, 12,000,000 pounds.

**COMMERCE.** The total foreign trade declined to \$23,218,924 in 1931 from \$33,781,060 in 1930. Imports in 1931 were valued at \$10,151,762 (\$15,220,219 in 1930) and exports at \$13,067,162 (\$18,551,841 in 1930). The three chief import items in 1931 were: Cotton and cotton manufactures, \$1,731,387 (\$2,364,845 in 1930); grains, fruits, vegetables, and preparations, \$1,403,674 (\$2,419,007); oils and minerals, \$1,059,767 (\$1,344,816). The leading exports were: Sugar, \$7,583,908 (\$9,910,289 in 1930); cacao, \$1,789,

115 (\$2,709,739 in 1930); coffee, \$1,182,490 (\$1,483,008). The United States in 1931 supplied imports to the value of \$10,151,762 (\$15,220,219 in 1930), or more than one-half of the total. The 1931 exports went principally to the United States, \$3,427,767 (\$4,368,121 in 1930); France, \$3,091,168 (\$2,456,792); United Kingdom, \$4,045,556 (\$7,329,192). In 1932 imports totaled \$7,794,000 and exports \$11,164,000 (preliminary).

**FINANCE.** In accordance with the American-Dominican convention of 1924, there is a customs receivership. Receiver William E. Pulliam reported gross collections for 1931 amounting to \$2,883,476, a decline of \$711,091, or 19.78 per cent, compared with 1930. Import duties accounted for \$2,820,232 of these receipts (\$3,505,338 in 1930). Of the gross revenue, \$1,386,578 was allocated to sinking-fund payments and \$914,361 for account of interest on the outstanding Dominican bonded indebtedness. Customs expenses absorbed \$131,961 and the relatively small sum of \$105,000 remained to be transferred to the Dominican government. The sum transferred in 1929 was \$3,461,814. From Oct. 26 to Dec. 31, 1931, the Dominican government secured an additional \$440,430 from customs revenue, as a result of the decree issued October 26 diverting the collections at the three principal ports—Santo Domingo, San Pedro de Macoris, and Puerto Plata—to a special emergency fund for a two-year period. Due to this diversion of funds, the receiver was obliged to discontinue amortization payments on the Dominican debt; interest payments were continued. The total amount of Dominican government bonds outstanding on Dec. 31, 1931, was \$16,593,500, a reduction of \$1,688,000 during the year. The government's budget estimates for 1931 placed revenue at \$12,094,870 and expenditure at \$9,957,662.

All government revenues in 1931 totaled \$7,311,417, against \$9,975,000 in 1930. Expenditures amounted to \$7,920,119 (\$10,642,000 in 1930) and the deficit to \$608,702 (\$667,000 in 1930). The 1931 deficit was increased to \$1,091,721 by cash purchases totaling \$115,813 to increase Government warehouse stock and unliquidated balances of appropriations amounting to \$367,206.

**COMMUNICATIONS.** Railway lines in 1930 extended 147 miles, including 62 miles of state owned line. There were 845 miles of highways (686 miles of macadam). There are air connections with San Juan, Puerto Rico; and Miami, Fla., via Cuba. The government-owned telephone and telegraph systems have been leased to American companies. There is direct radio-telegraph service to the United States. In 1930, 1687 vessels, of 2,381,606 tons, entered the ports and 1509, of 2,218,259 tons, cleared.

**GOVERNMENT.** Under the Constitution as revised in 1929, executive power is vested in a president, elected for four years, and a cabinet appointed by him. There is a senate of 12 members, one for each Province, and a lower chamber of 33 members, one for each 30,000 of population. The members of both houses are elected, nominally by direct suffrage, for four years; vacancies are filled by each house from a list of names submitted by the chief of the retired member's party. President in 1932, Gen. Rafael Leonidas Trujillo y Molina, who assumed office Aug. 16, 1930, following the successful revolution

of February, 1930. The only political party within the Republic in 1932 was President Trujillo's Dominican party, organized in 1931, which included all members of the government. Most of the opposition leaders had retired from public life.

**HISTORY.** On Aug. 16, 1932, anniversary of the restoration of the Dominican Republic, President Trujillo issued a proclamation offering political amnesty to persons who fled from the republic following the establishment of his régime in 1930. Few were reported to have accepted his invitation to return. Shortly afterwards, Rafael Estrella Ureña, who was removed from the office of Vice President by act of Congress on Dec. 7, 1931, was found living in obscurity in New York City. Reports that the moratorium on amortization payments on the foreign debt, placed in effect in 1931, would be extended to include interest payments also, were denied by President Trujillo in December, 1932. According to estimates of the U. S. State Department, there were 10,695 American citizens in the Dominican Republic on Jan. 1, 1933, most of them from Puerto Rico and the Virgin Islands.

**DONOVAN, COL. WILLIAM J.** See NEW YORK under *Political and Other Events*.

**DOOLITTLE, MAJ. JAMES A.** See AERONAUTICS.

**DOUMER, döömär', PAUL.** A French statesman, died in Paris, May 7, 1932, as a result of wounds inflicted by Paul Gorgoulou, a Russian Fascist, whose alleged purpose was to foment a war between the U.S.S.R. and France. The attack took place while President Doumer was making an official visit to the annual sale of books by well-known authors for the benefit of ex-soldiers.

Doumer was born in Aurillac, department of Cantal, Mar. 22, 1857, and after obtaining his education in Paris taught mathematics and economics. In about the year 1885 he entered political journalism in Paris and also became chief assistant to Charles Floquet, president of the Chamber of Deputies. In 1888 he was elected to the Chamber of Deputies as a Radical for the department of the Aisne and was reelected in 1890. He was Minister of Finances in the cabinet of Léon Bourgeois (1895-96). From 1897 to 1902 he was Governor-General of French Indo-China, where he sponsored important public works and accomplished the political and financial unification of the administration of this possession. Reëntering the Chamber in 1902, he became head of the budget commission, and in 1905 was made president of the Chamber. In 1906 he was the candidate of the moderate and reactionary parties for President of the Republic, but was defeated by Armand Fallières. He was elected to the Senate in 1912 as representative for Corsica, and was State Minister in Paul Painlevé's cabinet in 1917. In Aristide Briand's cabinets of 1921-22 and 1925-26 he was Minister of Finances. In 1927 he was made president of the Senate, a post which he was holding at the time of his election to the presidency on May 13, 1931. He was the second chief executive of France to die by assassination. On June 24, 1894, Marie François Sadi Carnot was stabbed by an Italian anarchist in Lyons. See FRANCE under *History*.

**DUDLEY, WILLIAM HUMBLE WARD, 2d EARL OF.** A British administrator, died in London, June 29, 1932. Born May 25, 1867, he attended Eton and succeeded to the title on the death of his father in 1885. In 1895 he was made parliamentary secretary of the Board of Trade. He served in the Boer War with the yeomanry cavalry and was also an assistant adjutant general on Lord Robert's staff. In 1902 he became Lord Lieutenant of Ireland. He was one of the chief supporters of the "devolution" policy, calling for the delegation of larger powers to local bodies, advanced by George Wyndham, Chief Secretary for Ireland. This policy, however, incurred the resentment of both the Irish Nationalists and Unionists and led to Wyndham's resignation and Dudley's recall on the fall of the Balfour ministry in December, 1905. After serving for two years as chairman of the Royal Commission on Congestion in Ireland, Lord Dudley was appointed Governor-General of Australia, where he remained until 1911. During the World War he commanded the 1st Worcester yeomanry in Egypt and at Gallipoli in 1915. He was one of the wealthiest British peers, owning about 30,000 acres rich in coal and minerals in Staffordshire and Worcestershire, as well as estates in Jamaica.

**DUFFY, FRANCIS PATRICK.** An American Roman Catholic clergyman, died in New York City, June 26, 1932. He was born in Cobourg, Ont., Canada, May 2, 1871, and was graduated from St. Michael's College, Toronto, in 1892. He then went to New York City where he taught at the grammar school of St. Francis Xavier's College, from which college he also received the A.M. degree in 1894. He studied for the priesthood at St. Joseph's Seminary, Troy, N. Y., and was ordained in 1896. He also attended the Catholic University of America and in 1899 received the S.T.B. degree. In 1905 he received the D.D. degree from St. Mary's Seminary, Baltimore, Md., and in 1919 the LL.D. degree from Fordham University. During the Spanish-American War he served as an unofficial chaplain at the post at Montauk Point, N. Y. From 1898 to 1912 he was professor of philosophy, logic, and metaphysics at St. Joseph's Seminary, Dunwoodie, N. Y. He then organized the Church of Our Saviour, South Fordham, New York City, and served as rector for eight years. In 1916 he accompanied the 69th regiment of the New York National Guard to the Mexican border. Of this regiment, which was known as the 165th infantry of the National Army, during the World War, he was chaplain oversea. Also he was senior chaplain of the 42d (Rainbow) division, to which this regiment belonged. For his distinguished services he was advanced in rank from first lieutenant to major, and was recommended by Gen. Douglas MacArthur, commander of the 42d division, as colonel but refused the commission. He received the Distinguished Service Cross, the Distinguished Service Medal, the Croix de Guerre with palm, and was made a Chevalier of the French Legion of Honor. In 1920 he became pastor of Holy Cross Church, New York City, and in 1925 president

of the Catholic Summer School of America. He was President of the Rainbow Division Veterans, 1925-1928. He remained chaplain of the 165th regiment of the New York National Guard, holding at the time of his death the rank of lieutenant-colonel. He was editor of the *Catholic Register*, Toronto (1895), associate editor of the *New York Review* (1905-10), and author of *Father Duffy's Story* (1919).

**DUKE UNIVERSITY.** An institution for higher education in Durham, N. C. It had its beginning under the name of York Academy, established in 1835 in Randolph County, N. C., and expanding later into Union Institute, then into Normal School, and in 1858 into Trinity College. In 1892, Trinity College was moved to Durham where it continued under that name until 1924, when the greater Duke University was made possible through benefactions from James B. Duke.

The enrollment for the autumn of 1932 was 2755; distributed as follows: Undergraduate men, 1429; undergraduate women, 637; school of religion, 143; school of law, 100; school of medicine, 158; other graduate schools, including arts and sciences, 223; school of nursing, 74; duplications, 9. For the summer session of 1932 there was an enrollment of 1798. In the autumn of 1932 the faculty, including officers, numbered 299.

The endowment funds of the university amounted to \$23,333,473.72, and the income for the year was \$1,202,194.21. Gifts received during the year 1931-32 amounted to \$136,250. The Angier B. Duke Memorial Student Loan Fund exceeded \$1,250,000 in value. The library contained 307,601 accessioned volumes and more than 40,000 uncatalogued volumes. President, William Preston Few, Ph.D., LL.D.

**DYNAMO ELECTRIC MACHINERY.** The development of most outstanding interest in large machines was the construction and almost completion of the two mercury-vapor boilers and turbines, one at Kearny, N. J., and the other at Schenectady, N. Y. In the boilers mercury will be raised to a temperature of 950° F. and a pressure of 125 lbs. gauge. The vapor will pass through a turbine giving 20,000 kw. of power to its electrical generator and then at 450° F. to a condenser where it will be reduced to liquid mercury but in so doing, it raises water to a temperature of 400° F. and 400 lbs. pressure which will give 30,000 kw. of power in an ordinary steam turbine. Each installation requires 135 tons of mercury, said to have cost \$178,000.

By this means a kw.-hr. is obtained with less than 10,000 b.t.u. overall which is a very high thermal efficiency. In the mercury cycle alone a kw.-hr. is obtained for 4000 b.t.u.

A similar unit of 10,000 kw. capacity has been in operation at Hartford, Conn., for a year and has been in service 96 per cent of the time.

Among steam turbines the largest was the second 180,000 kw. for the Brooklyn Edison Co., a duplicate of that reported last year.

There was also a 147,000-kv.-a., 1800-r.p.m., 22,000-volt set added to the State Line station of Chicago and a 121,000-kv.-a., 1800-r.p.m., 18,000-volt unit for Waukegan, Wis.

Under construction for use with 1200-lb. steam at 825° F. is a 150,000-kw., 1800-r.p.m. unit consisting of one generator with three turbine cylinders arranged triple-tandem-compound. This is the largest unit so far for operation on steam at 1200 lbs.

A 15,000 kw. and a 25,000 kw. each were added to the line of machines operating at 3600 r.p.m., a new record for size at this speed. A 6000-kw. steam turbine-generator unit is the first to be built for operation outdoors without other protection than its own lagging and casing.

In the construction of all these new turbines and their generators electric welding has played an increasingly important part and minimized material. X-rays have been used to inspect the welds and it is now possible to "see" faults through four inches of steel. Much research has been devoted to the effects of the high temperatures (800 to 1000° F.) upon the mechanical strength of the metals used and this has resulted in much more confidence. As for operating conditions, new instruments have been devised which give a continuous record of conditions inside the turbine, such as, eccentricity, interference, and vibration. For years past the temperatures of various parts of the generators have been recorded by suitable instruments.

There were no striking developments in water-wheel generators. The outstanding accomplishment was the opening of the Safe Harbor plant on the Susquehanna River in Pennsylvania. The present installation consists of five 42,500-h.p. Kaplan turbines each driving a 36,000-kv.-a., three-phase 13,800-volt, 60-cycle generator and one driving a 37,500-kv.-a., single-phase, 25-cycle generator. Ultimately there are to be 12 units aggregating 510,000 h.p.

These are the most powerful turbines of this type. They operate with a head of 55 ft. on a vertical shaft and have propellers with automatically adjustable blades to give a high efficiency at fractional loads. The power from this station goes partly to Baltimore and partly to Philadelphia on 220,000-volt transmission lines.

The Abitibi Power Co. of Canada has built a plant containing five vertical shaft water-wheel units of 48,500 kv.-a. each at 13,800 volts and 25 cycles.

In England some high voltage d.c. generators were built to give 45,000 volts and 0.15 ampere for precipitating solid particles in gases and smoke. Each unit consists of one motor driving three generators on one shaft. The generators are mounted on porcelain insulators, give 15,000 volts each and are connected electrically in series.

A record in size of single phase frequency changers was achieved in the 30,000-kv.-a., 60 to 25 cycle, three-phase to single-phase sets for the Philadelphia Electric Co. to supply power for the Pennsylvania R.R. The sets consist of a 36,000-kv.-a., three-phase, 60-cycle synchronous motor driving a 30,000-kv.-a., single-phase, 25-cycle, 13,200-volt generator. The generator would have a capacity of 61,000 kv.-a. if operated three-phase.

The special features of the set are that the machines are of the indoor type but are operated outdoors and protected by a close-fitting steel plate housing. There is a closed system of cool-

ing and ventilating and the frame of the driving motor is arranged to be rotated slightly in a cradle to give a phase shift for load regulation and operation in parallel with other sets.

Another installation of frequency-changers is of the variable frequency-ratio type. The set consists of a 25-cycle induction motor and a 25,000-kv-a., 60-cycle synchronous generator and auxiliary machines on the same shaft. It is arranged to feed very low (slip) frequency into the wound rotor of the induction motor in accordance with the Scherbius system of speed control (see YEAR BOOK, 1929) of induction motors.

Four of the largest single-phase transformers of the non-resonating or surge-proof type for 230,000 volts were rated at 45,000 kv-a. each when operated self cooled and 60,000 kv-a. when operated with forced oil cooling. The low voltage side consisted of two independent 22,000-volt windings to be connected to a double winding generator. Each transformer weighed 393,000 lbs. including 152,000 lbs. of oil.

There was an installation of 100,000 kv-a. consisting of three 33,333-kv-a. water-cooled transformers connected in Y for 66,000 volts with load ratio control on the high-tension side and in series with the high-voltage winding is a 100,000-kv-a. regulating transformer to give a shift of  $\pm 6^\circ$  for load control and synchronizing. This is the largest bank with control of both the magnitude and phase of the voltage.

Much attention has been given to synchronous motors, to improve their ability to start under load and accelerate against the fly-wheel effect of the load and finally to pull this load into synchronism. By improvements in details of design motors have been built to do this in sizes from 200 to 600 h.p. with rated speeds from 300 to 900 r.p.m.

Multispeed motors of both the induction and synchronous type have recently been put on the market. These motors have changeable windings giving two numbers of poles and hence two stable speeds with high efficiency. Motors of the induction type having these characteristics have been used for ship propulsion for some time but the offering of a commercial line of sizes suited for industry is new as is also the application of the principle to synchronous motors.

A new type of induction motor was brought out having three power ratings (only one speed) with high efficiency and high power factor at all three ratings. This is accomplished by bringing out taps on the windings of the primary so that they may be connected in delta for the highest rating, in a combined Y with delta centre for medium and in simple Y for lowest rating. They are used where the power demand is seasonal or for installations which are expected to develop and need more power in the future.

Another new type of induction motor (proposed but not in production) has its primary and secondary windings connected together in parallel (by means of a transformer, if necessary). This gives it a greater maximum output hence greater pull-out torque and higher efficiency at overloads but the same maximum efficiency. It might be suitable for rolling mills where sudden heavy overloads are experienced.

There has been a great increase in the use of totally enclosed fan-cooled motors and they are being built in greater numbers and in larger sizes. Their advantage is the freedom from con-

tamination by dirt, splashing, and humid atmosphere.

Experimental research has been carried on by some companies with a commutatorless motor which uses a structure of the synchronous type, fed by an electron tube frequency-converter which supplies the motor with direct current at stand-still, low frequencies at low speeds, and high frequencies at high speeds by changing the supplied frequency to suit the speed of the motor. The tubes are controlled by a small distributor on the motor shaft. The motor is thus always running at synchronous speed, even at stand-still and has the characteristics of a d.c. shunt motor, i.e. constant torque per ampere at any speed. Also the motor may be arranged with the winding of the field in series with the neutral of the primary, in which case series motor characteristics may be obtained. An experimental locomotive using this type of motor is being built in Switzerland.

A great deal of attention has been given to the elimination of noise and vibration in electric machines. Means are now available for measuring and comparing noise, a committee is being formed to standardize nomenclature, units and methods of measuring and designers of motors are paying attention to careful balancing of the moving parts and to the air currents set up. A device is in regular commercial use which determines just what weight should be placed on the revolving part and just where it should be placed to give exact dynamic balancing. A new line of motors is placed on a spring support in the base so that no vibration may be transmitted to the floor or building.

The greatest activity has been exhibited in the commercial development of electron tubes for power work. They are now being used as rectifiers, converters, inverters, relays, and controllers. By placing a grid or third electrode in the well-known mercury vapor tube a new device has been obtained which carries currents of power magnitude and is capable of multifarious applications with close control and regulation.

These tubes cannot only convert from a.c. to d.c. as has been their only application in the past but also from d.c. to a.c. (inverter) or from a.c. of one frequency to a.c. of any other frequency. Tubes are now on the market capable of carrying as high as 600 amperes and others capable of operation on 15,000 volts while tubes for 100,000 volts have been used in research.

A new liquid dielectric useful as an insulating material has been developed and given the trade name "Pyranol." It appears to be a substitute for oil as an insulator as it is non-inflammable and non-explosive. It is now being used as the dielectric in capacitors as it has a high dielectric constant (5). Its use in transformers depends upon the character of the insulation on the windings as it attacks chemically the older standard varnishes and can only be used with special insulating materials such as "Glyptol," the new synthetic substitute for varnishes.

Non-Linear Circuits is a new term being introduced in electrical engineering which applies to a device containing capacitance and reactance in which the reactance varies suddenly and greatly at certain values of the current due to a purposely high saturation in the iron of the reactance device. This characteristic is obtained by imposing a chosen d.c. magneto motive force on the magnetic circuit of the reactance for the

a.c. circuit. By this means regulators are obtained which will vary the voltage or current in a circuit in a definite manner. The most easily understood example is controlling the lamps in the different words of a lighting sign to have each group lighted a definite interval of time in succession.

The systematized research on dielectrics and electrical insulation has been continued intensively and many new facts have been learned and published. A few of the most general interest are: By careful preparation it has been possible to produce insulating oils having a conductivity of  $10^{-18}$  to  $10^{-19}$  mhos. Dielectric losses in highly refined insulating oils at commercial frequencies and operating temperatures have been shown to result from conduction but at high frequencies and low temperatures the major loss may be accounted for by the orientation of polar molecules. The subject of polar molecules in dielectrics is now being studied for viscous liquids and solids and is giving very important results; development of polar molecules in oils gives a measure of deterioration. A remarkable agreement has been found between the measured loss, power factor and capacity values at 60 cycles for solid and liquid dielectrics and the values calculated from the d.c. characteristics.

**EARTHQUAKES.** See SEISMOLOGY.

**EAST AFRICA PROTECTORATE.** See KENYA COLONY.

**EASTMAN, GEORGE.** An American inventor and industrial philanthropist, died in Rochester, N. Y., Mar. 14, 1932. He was born at Waterville, N. Y., July 12, 1854, and attended the public schools of Rochester. An enthusiastic amateur photographer, he perfected about 1880 a process for manufacturing sensitive gelatin dry plates and also invented a machine for coating these plates. In 1884 he patented the first commercially successful rollable film, consisting of a paper backing coated with a soluble gelatin layer, a layer of collodion, and finally with a hardened sensitive gelatin emulsion. The following year he and W. H. Walker, his associate, invented a roll holder to contain this film which was attached to the back of the camera. In 1888 he perfected the first portable roll-film camera, called the "Kodak," which carried a roll of film for 100 exposures. With its introduction he coined one of his first slogans, "You push the button, we do the rest," for when the film was used up, the camera was returned to the manufacturing company to develop and print the pictures and to reload it. A year later, in August, 1889, he introduced commercially the first film coated on a rollable transparent support. Patents were granted him and his associates that year and subsequently on the process and machines for working it. This invention was considered by many one of the most important contributions to the photographic art. It made possible the widespread development not only of amateur photography but also of motion picture photography, for it enabled Thomas A. Edison to perfect the Kinetoscope and paved the way for the development of the motion picture industry. In 1891 he introduced a cartridge device for the protection of films, which permitted daylight loading of the film in the Kodak. The pocket Kodak was introduced in 1895 and the first folding Kodak in 1898. This was followed in 1902 by the Kodak

development machine, which enabled the user to dispense with the dark-room in the development of the negative. In 1903 a non-curling film was devised and marketed.

Mr. Eastman was one of the first executives to adopt the practice of mass production to reduce the cost of a salable product. He also was one of the first to recognize the value of a research programme and to employ trained men to conduct research work, including much fundamental scientific investigation.

At the time of his death Mr. Eastman was chairman of the board of the Eastman Kodak Co. of New York and of the Eastman Kodak Co. of New Jersey. The former, which was formed in Rochester in 1892 with Mr. Eastman as treasurer, was an outgrowth of earlier firms which he had organized, including, with Col. Henry A. Strong, Strong & Eastman (1881), the Eastman Dry Plate Co. (1882), and the Eastman Dry Plate & Film Co. (1884). The Eastman Kodak Co. of New Jersey was incorporated in 1901 so as to consolidate the various properties, such as the General Aristo Co., which had been acquired as subsidiaries of the parent company. He was also a director of Kodak, Ltd., of London and of about 85 subsidiary companies throughout the world which furnished necessary raw products or served as sources of supply.

George Eastman was a leader in recognizing the important part played by the members of an industrial organization in the success of the business and the justice of material rewards for this participation. As early as 1912 he caused the Eastman Kodak Company to pay a "wage dividend" to employees over and above the amount of wages or salaries and bearing a direct relationship to the amount of dividends declared on the common stock of the company during the previous year.

The wage dividend has been paid uninterruptedly since then, with \$33,584,686 thus distributed by the end of 1932. Mr. Eastman personally contributed a large block of stock in the Eastman Kodak Company, and caused the organization to contribute a similar block from its treasury, for distribution to employees on a basis of length of service. Subsequently, following Mr. Eastman's policy, the company made provision for retirement annuities, disability benefits, and life insurance for employees.

During his later life he was personally interested in the adoption of a 13-month calendar, in the fostering of music as part of the community life of his native city, and in African wild-life photography. His philanthropic gifts amounted to almost \$100,000,000, the greatest beneficiaries being the city and the University of Rochester. To the latter he gave more than \$54,000,000, part of which was used as endowment for the Eastman School of Music. He also gave lavishly to the Massachusetts Institute of Technology, which received \$19,500,000, Stevens Institute of Technology, Hampton Institute, and Tuskegee Normal and Industrial Institute. Previous to his death he had established dental clinics in Rochester, London, Paris, Rome, Brussels, and Stockholm. Among the honors bestowed on him were the 1927 Progress Medal of the Royal Photographic Society (London), the medal of the American Institute of Chemists, officer of the French Legion of Honor, commander of the Order of the Crown of Italy, officer of the Cross of the Order Polonia Restituta, knight of the Royal Order of

Vasa, and, posthumously, the officer of the Cross of the Order of Leopold. His career was tragically ended by suicide, the only explanation being a note to his friends: "My work is done. Why wait?"

**EAST PRUSSIA.** A Province of the state of Prussia separated from Prussia and from the German Reich by the Polish Corridor. Total area, 15,061 square miles; population June 16, 1925, was 2,256,349. See GERMANY and POLAND under *History*.

**ECCLIESIASTICAL ARCHITECTURE.** See ARCHITECTURE.

**ECLIPSE OF THE SUN.** See ASTRONOMY; PHOTOGRAPHY.

**ECOLOGY.** See BOTANY.

**ECONOMIC ASSOCIATION, AMERICAN.** An organization founded in Saratoga, N. Y., in 1885 to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life; to issue publications on economic subjects; and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership, which in 1932 totaled approximately 3700, comprises persons interested in the study of political economy or the economic phases of political and social questions.

The association held its annual meeting in Cincinnati, O., Dec. 28-30, 1932. Among the topics discussed were: "The Rise of Monopoly in the United States"; "Farm Debt and Distressed Land Holding"; "Record of Insurance in the Depression"; "Reserves for Unemployment"; "Stabilization of Industries"; "American Economic Thought"; "Size of Business Unit as a Factor in Efficiency of Marketing"; "Federal Reserve Policy Since 1926"; "The Tariff"; "Real Estate Speculation." Papers read at the meetings are published in the *Proceedings* of the association. The official periodical is the *American Economic Review*, a quarterly. The officers in 1932 were: President, George E. Barnett, Johns Hopkins University; vice presidents, Benjamin M. Anderson, Jr., New York City, and Ralph E. Heilmann, Northwestern University; counsel, John E. Walker, Washington, D. C.; and secretary and treasurer, Frederick S. Deibler, Northwestern University.

**ECONOMIC ENTOMOLOGY.** See ENTOMOLOGY, ECONOMIC.

**ECONOMIC GEOLOGY.** See GEOLOGY.

**ECONOMICS.** See BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; LITERATURE, ENGLISH AND AMERICAN; PUBLIC FINANCE, ETC.

**ECUADOR**, êk'wâ-dôr. A South American republic situated on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

**AREA AND POPULATION.** The area in 1931, still undetermined because of the boundary dispute with Peru, was variously estimated at from 110,000 to 337,304 square miles, including the Galapagos or Colon Islands (2868 square miles), situated 600 miles west of Ecuador in the Pacific. The population in October, 1931, was estimated at 2,500,000. One estimate placed the white population at 10 per cent of the total; Indians, 38 per cent; mixed, 41 per cent; Negroes, 5 per cent; others, 6 per cent. The chief cities, with their approximate populations in 1930, are: Quito, 91,641; Guayaquil, 120,000; Cuenca, 40,000; Riobamba, 30,000; Latacunga, 15,000; Ambato, 14,000. Births in 1930 totaled 97,361; deaths, 44,385; marriages, 13,799.

**EDUCATION.** Primary education is free and nominally compulsory. In 1932, there were 1864 primary schools, including 1523 government, 114 municipal, and 260 private schools, with a total of 113,583 enrolled pupils. Sixteen secondary schools had 2532 pupils; normal and special schools, 2633. Institutions of higher learning are the Central University at Quito, Guayas University at Guayaquil, Azuay University in Cuenca, and the Law College at Loja.

**PRODUCTION.** Ecuador's main industry is agriculture, on which about 90 per cent of the population is dependent for a living. The prosperity of the country has been undermined by the drastic decline in the value of the two chief crops—cacao and coffee. Largely due to blights, the production of cacao declined from 60,000 tons to 14,000 tons in 1931. Coffee exports fell from 17,275,208 sucres in 1928 to 7,601,932 sucres in 1930 (sucre equals \$0.20 at par). Other exports, chiefly cattle, petroleum, rice, flour, sugar, hats, and textiles, have increased in value, from 35,078,122 sucres in 1927 to 49,641,016 in 1930. Ivory nuts, cotton, sugar, kapok, are also produced. The 1931 production of coffee was 20,800,000 pounds; rice, 36,591,000 pounds; cotton (1931-32), 5,624,000 pounds; sugar (1930-31), 23,600 long tons.

Petroleum output is about 180,000 tons annually. There are fairly extensive deposits of copper, iron, lead, coal, gold, silver, and sulphur, mostly undeveloped. The forests, which cover most of the country, yield valuable dyewoods, rubber, cinchona, balsa wood, and other products. The leading industries are the making of straw (Panama) hats, textiles, and shoes, the grinding of sugar cane, and rice hulling.

**COMMERCE.** According to Ecuadorean statistics, exports in 1931 totaled \$11,332,034 (\$16,129,308 in 1930) and imports \$8,815,224 (\$12,796,221 in 1930), or declines of 29.7 per cent and 31.1 per cent, respectively. The value of the leading exports was: Crude petroleum, \$3,164,813 (\$3,159,687 in 1930); cacao, \$2,450,909 (\$4,680,718 in 1930); coffee, \$1,186,096 (\$1,520,386); straw hats, \$1,289,331 (\$1,680,532); cyanide precipitates, \$1,264,171 (\$1,477,725). The three leading import classes were: Cotton and cotton manufactures, \$1,527,000 (\$1,980,000 in 1930); animals, foods, beverages, \$1,323,000 (\$1,966,000); metals and manufactures thereof, \$1,241,000 (\$1,959,000). Imports in 1931 came chiefly from the United States, \$3,308,176 (\$5,137,105 in 1930); Great Britain, \$1,606,128 (\$2,327,092); Germany, \$1,180,169 (\$1,667,875). Exports went principally to the United States, \$5,232,244 (\$7,604,988 in 1930); France, \$996,874 (\$1,059,945); Germany, \$598,929 (\$1,150,493); Colombia, \$626,551 (\$1,955,080).

Conversions to dollars were made at the par value of the sucre (20 cents).

**FINANCE.** The budget estimates balanced at 47,664,900 sucres for 1932 and at 61,476,500 sucres for 1931. A final deficit was indicated for both years, however. The public debt on Oct. 31, 1931, aggregated 125,853,513 sucres, of which 114,840,047 sucres represented the external and 11,013,466 sucres the internal debt. A loan of 10,000,000 sucres obtained from the Swedish Match company in 1928 was guaranteed by a match monopoly, but this was revoked by Congress in 1931. Ecuador abandoned the gold standard on Feb. 9, 1932. American investments in Ecuador in 1931 were estimated by the U. S.

Commerce Department at \$11,770,000; British investments were about £4,000,000.

Actual ordinary revenues in 1931 were 43,983,159 sucres; expenditures, 44,429,614 sucres; deficit, 446,455 sucres. For 1930, revenues were 60,494,000 sucres, expenditures, 60,178,000 sucres; surplus, 316,000 sucres.

**COMMUNICATIONS.** In 1930, there were nine railways in operation, aggregating 639 miles of line; 1388 miles of main trunk highways; 2217 miles of secondary roads; and mail and passenger air service connecting Guayaquil with the other chief cities of North and South America.

**GOVERNMENT.** The Constitution promulgated Mar. 26, 1929, vested executive power in a president elected for four years by direct suffrage, and legislative power in a congress of two houses. The Senate has 32 members elected for four years by the Provinces and occupational groups; the Chamber of Deputies, 56 members elected for two years by direct vote of literate male and female citizens. At the beginning of 1932, the Provisional President was Dr. Don Alfredo Baquerizo Moreno, who assumed office Oct. 15, 1931, following the forced resignation of President Isidro Ayora.

### HISTORY

**BONIFAZ REPUDIATED.** When Neptali Bonifaz, wealthy Conservative landowner, was elected President on Oct. 20-21, 1931, through a split in the Liberal party ranks, it was the first time in many years that the hold of the Liberals on the government had been shaken. As predicted, Liberal efforts to prevent the President-elect from assuming office on the scheduled date—Sept. 1, 1932—developed early in the year. The first move was revolt led by Commander Ildefonso Mendoza, one of the defeated Liberal candidates, who on Apr. 7, 1932, seized the fort at Punta Piedras, commanding the Guayas River between Guayaquil and the coast, and two gunboats. He was unsuccessful in his effort to prevent the return of former President Leonidas Plaza Gutierrez, Conservative who had been in exile since 1925. His naval followers were captured by government forces April 11 and one of his assistants, Capt. Benignos Abad, was sentenced on April 24 to eight years imprisonment. On July 13, government officials arrested Col. Luis Larrea Alba, who had been Provisional President for two months in 1931, and announced that they had frustrated a second conspiracy to make him dictator through a military *coup d'état* (see 1931 YEAR BOOK).

Meanwhile it was discovered that Señor Bonifaz had assumed Peruvian citizenship 28 years earlier and had registered his first three sons as Peruvians. There was an immediate demand for his withdrawal as President-elect, arising partly from political partisanship and partly from the strong hostility among Ecuadoreans toward Peru. The Constitution provided that the President must be an Ecuadorean citizen. When Congress convened August 10, anti-Bonifaz crowds demonstrated in the streets of Quito. Under pressure of public opinion, Congress on August 19 sent a special commission to ask the President-elect to renounce the office, but he refused. The following day Congress, by a vote of 48 to 36, declared him ineligible. Supported by the Army, which was Liberal in its sympathies, Congress on August 26 authorized Provisional President Baquerizo Moreno to remain in office until a new election could be held.

The following day the Provisional President was forced to take refuge in the Argentine Legation by a revolt of part of the Quito garrison, supported by adherents of Bonifaz. The remainder of the army remained loyal. Troops converged upon the capital from various directions and aided by Liberal civilians recaptured the city on September 2 after several days of severe fighting in which from 800 to 1000 persons were killed. Bonifaz, in turn, took refuge in the American Legation. Alberto Guerrero Martínez, president of the Senate, was installed as Provisional President and on September 4 the Provisional government called new elections for October 30 and 31. In the elections, which were accompanied by disorders in Guayaquil and charges of fraud, Juan de Dios Martínez Mera (Liberal) decisively defeated Manuel Sotomayor y Luna (Conservative). The new President, a financier, was said to command the confidence of the propertied classes.

**THE FINANCIAL CRISIS.** Alarmed by the decline in the gold reserves of the Banco Central and facing the necessity of a loan to balance the 1932 budget, the government on February 7 passed a measure authorizing the Banco Central to abandon the gold standard. The government then secured a loan of 12,000,000 sucres (about \$2,000,000) from the bank. The exchange value of the sucre immediately declined, from 5.06 to 6.50 to the dollar. Under pressure from importers, the government on May 2 undertook to control foreign exchange operations through the Banco Central. The exchange relations led to some restriction of business and brought to the fore the traditional conflict between the importers of the coast, who opposed the depreciation of the sucre, and the mountain farmers, who favored it as a means of restricting imports of flour and lard. Both the suspension of the gold standard and exchange control were announced as temporary measures, to be reconsidered in November.

Before President Martínez Mera was inaugurated on Dec. 5, 1932, another anti-administration conspiracy was crushed at Quito on November 24. His cabinet, announced December 7, consisted of: Minister of Government, José María Pérez Echanique; Foreign Affairs, Antonio J. Quevedo; Education, Dr. Leopoldo Izquiete Pérez; Public Works, Alfredo Espinosa Palacios; Finance, Federico Cornejo; War, Gen. Juan Francisco Orellano. On December 8, Alberto Guerrero Martínez resigned as President of the Ecuadorean Senate due to the opposition of his colleagues. For Ecuador's part in the Leticia dispute, see COLOMBIA under *History*.

**EDUCATION IN THE UNITED STATES.**

**STATISTICS.** *Attendance.* The latest available report of the United States Office of Education shows that the enrollment of pupils and students in all of the educational institutions of the country in 1930 totaled 29,908,544. These were divided as follows: public kindergarten and elementary schools, 21,278,593; private kindergartens and elementary schools, 2,309,886; public high schools, 4,399,422; private high schools, 341,158; secondary schools in preparatory departments of colleges, 47,309; secondary students in normal schools, 11,978; in normal

schools and teachers' colleges, 161,524; universities and colleges, 924,276; in private business and commercial schools, 179,756.

Between 1922 and 1930 the enrollment in kindergartens increased by about 30 per cent. In the latter year only one child in three who was eligible was enrolled. Reports state that cities do not indicate any pronounced tendency to abolish kindergartens. There are, however, many evidences that there will be marked changes in policies. It has been assumed that the enrollment in a kindergarten must be small and that the teacher must have an assistant. At present there are places in which 60 children are found in a kindergarten with only one teacher. In other places the children are divided. As many as 30 attend during the forenoon, and the same teacher cares for an equal number in the afternoon.

The nursery school as it is now conceived has never been an integral part of the school system. Various cities have experimented with the conduct of such institutions. At present it seems that the expense will be prohibitive. There are few indications that these schools will be brought into the regular systems as long as there is the present demand for economy. The Office of Education made public the following statement regarding school enrollments in the public schools of the United States:

Seven out of every ten Americans between 5 and 20 years of age attend school. For the United States as a whole, of the 17,209,566 persons from 7 to 13 years of age, 16,394,400, or 95.3 per cent, attended school at the end of the decade. This was an advance from 90.6 per cent in 1920.

Those between the ages of 14 and 15 numbered 4,678,084, while 4,156,378, or 88.8 per cent, were enrolled in school. In 1920, only 79.9 per cent of this group was in school. Turning to those between the ages of 16 and 17, which numbered 4,663,137, 57.3 per cent, or 2,669,857, were enrolled. In 1920 only 42.9 per cent of this group entered school.

There are 6,815,710 persons within the country between the ages of 18 and 20, of which number 1,456,784, or 21.4 per cent, go to school. In 1920 this group, the lowest of all, constituted but 14.8 per cent of that age population.

One of the significant increases has been among adults above 21 years of age in turning toward organized education. The number of students 21 or over increased during the decade nearly 300 per cent. In 1920 but 844,789 adults attended school. In 1930 the number had increased beyond 1,034,000.

**Costs.** The following facts regarding the costs of education are found in the report of the Office of Education for 1930. The total expenditure for education of all kinds, both public and private in the United States, for that year was \$3,234,638,567. The grand total of income for that year was \$3,459,375,539. Of this total, \$2,822,914,120 was for public institutions, and \$636,461,419 was for private institutions.

The total income for the public schools, including kindergarten, elementary, and secondary schools, for 1930 was \$2,469,311,376. This was derived as follows: from federal aid, \$7,333,834; from States, \$353,670,462; from counties, \$216,746,764; from local units, \$1,510,805,777; from loans and sale of bonds, \$357,050,699; sale of property and insurance adjustment, \$5,002,444; from other sources, \$18,701,396; income from school lands and permanent school funds, \$27,510,517. The total current expense for the public schools for 1930 was \$2,306,965,557. This included general control, \$78,679,502; salaries, \$1,250,427,194; textbooks, \$25,150,281; supplies used in instruction, \$42,149,758; operation, \$216,072,433; maintenance, \$78,810,238; auxil-

iary agencies, such as libraries, transportation of pupils, and health service, \$101,922,622; fixed charges, including pensions and insurance, \$50,269,680; capital outlay, \$370,877,969; interest, \$92,535,880.

In addition to the current expenses there were payment of bonds and loans, \$144,950,229; payment in sinking funds, \$13,980,119. During the year the matter of school costs has been under serious consideration. There has been a general attempt to economize. It is impossible to estimate the extent to which savings have been effected because many of the devices for economizing do not appear in the school reports. Many cities that report no cut in teachers' wages are receiving "contributions" of 10 per cent or more from the teachers' wages. Other cities have announced cuts of various amounts ranging from 10 to 35 per cent. In some cases, these cuts have been made on salaries that were decreased by 10 per cent or more the previous year.

Most school systems have increased the size of classes so as to reduce the number of teachers needed. Special subject teachers and supervisors have in many cases been eliminated. In some systems, the school term has been shortened. Reports from various parts of the country indicate that many systems are facing the necessity of closing schools because of lack of funds. There are places in which the teachers have had no salary over a period of several months.

Publishers of textbooks report a marked decrease in sales during the past year. The demand for school supplies and equipment has decreased to such an extent that a number of the more prominent school equipment plants have been closed. San Antonio, Texas, announced that their budget of \$2,421,240 for the school year ending June 30, 1932, had been decreased to \$1,500,000 for the following year. There is also a marked decrease in school building. Except in those places where the school term has been very greatly shortened, there has been no claim that the efficiency of the school has been greatly impaired. This is held to be due to the loyalty of the teachers, many of whom have served during the past year with little or no salary.

In connection with the actual achievement of marked economies in the conduct of the schools, it is interesting to note the attitude of such organizations as the National Education Association. In the resolutions adopted at their mid-summer meeting, they condemned a policy of retrenchment on expenses in the schools and immediately urged activities that would tend to increase expenses.

**Debts.** The public school debts in the United States amount to over \$2,425,000,000. Five States each have debts of more than \$200,000,000. These are Pennsylvania, \$272,795,327; New York, \$259,147,786; Ohio, \$229,258,598; New Jersey, \$213,267,468; and California, \$211,014,607. There are 13 States with debts in excess of \$50,000,000 each.

In the State of New Jersey the average indebtedness per pupil in average daily attendance was \$321.69. The corresponding cost in Pennsylvania was \$164.22.

In 1920 the Office of Education received reports of indebtedness from 34 States. These reported a total of \$651,930,112. In 1930 the same States reported indebtedness amounting to \$2,120,795,919. This shows an increase of 225.3 per cent. In 1920 the average indebtedness per

pupil in average daily attendance was \$54.17. In 1930 the average was \$114.08, an increase of 110.6 per cent.

The Office of Education also shows that in 1930 the public paid interest amounting to \$92,535,880; for bonds and loans, \$144,950,229, and for sinking funds, \$13,980,119. The payments for interest amounted to 4 per cent of the total costs of public schools.

**Property.** The Federal Office of Education published reports showing that the total value of public school property in the United States is \$6,211,327,040. This figure is for public elementary and secondary schools in 1930. The report shows that between 1928 and 1930 the value of school property increased by \$725,000,000.

For the United States the value of school property per pupil enrolled was \$242. In New York State it was \$407, while in Georgia it was \$72.

Public school property for elementary and secondary schools exceeds \$100,000,000 in 16 American States. New York valuation is \$871,000,000; Illinois, \$441,000,000; and California, \$427,000,000. The valuation in Ohio is \$409,000,000; in Michigan, \$338,000,000; in New Jersey, \$292,000,000, and in Massachusetts, \$243,000,000. The valuation in Texas is \$206,000,000, while in Connecticut, Indiana, Iowa, Minnesota, North Carolina, and Wisconsin it ranges above \$100,000,000.

**CHARACTER EDUCATION.** The development of character has been considered as a direct result of education. It has been somewhat unusual for the schools to undertake direct instruction in character education. At present there is a decided tendency to provide for character training in the curricula of both elementary and secondary schools.

Professors George H. Betts and George E. Hill of Northwestern University have made public the results of an extensive investigation of character education. They had reports from 836 cities. Fully one-fourth of these reported definite time allotment for character education in one or more grades of the public school system. These allotments were more frequent in the elementary than in the high school. On the average, one hour a week is allowed.

It is evident that the movement is at present without definite guidance. Much of the subject matter used by the teachers is locally prepared. A number of the cities reporting have committees of teachers working on the curriculum for character training, and a few places reported research projects under way.

The majority of cities that reported believed that character should be an indirect outcome of school work rather than a specific subject in the curriculum.

The investigators found that "there is a decided tendency to recognize character outcomes on the school report card, especially in the elementary grades and kindergarten."

The nature of the ends desired is indicated by the traits most commonly appearing on the report cards. They are effort, conduct, cooperation, courtesy, obedience, and persistence.

**THE NATIONAL SURVEY OF SECONDARY EDUCATION.** During the year the three-year national survey conducted by the Federal Office of Education was completed. The findings and recommendations are to appear in 28 monographs.

The survey staff studied the returns from more than 200,000 inquiry forms answered by

principals, teachers, pupils, parents, and employers. They also visited 550 different high schools.

Dr. Leonard V. Koos of the University of Chicago, who was the associate director in active charge of the survey, has summarized the report. He indicates that the increased enrollments in high schools show that "increasing proportions of children from what are termed the lower economic levels are being given opportunities of education on the secondary level."

Concerning the curriculum of the secondary school he states that the tendencies "have been away from foreign languages and mathematics (college entrance subjects) and toward social subjects and physical education." He reports that "non-academic subjects, including fine arts and practical arts, have shown a decided increase. In many schools non-academic subjects are now said to claim from a third to two-fifths of the pupils' time."

There has been an increase in trade schools. There are, however, fewer technical and commercial high schools. Continuation, evening, and summer schools are developing, and there is greater use of corresponding courses. College admission requirements show a greater flexibility.

Dr. Koos states that the reports of the survey will show the nature and direction of progress in each State. The reports will, therefore, be of great help to all those who are responsible for the management of secondary schools.

**STATE SCHOOL EFFICIENCIES.** From time to time, there have been attempts to measure the efficiencies of the various State school systems. Such attempts have never met with success. This is particularly true when the results have been combined in such way as to give a single figure as the rating or relative position of each State.

During 1932, the research department of the National Education Association published the results of an investigation in which the relative status of the States was given in respect to five specific features.

The features selected were: (1) The proportion of children reached by the services of the school. By this is meant the total attendance of children 5-17 years of age in comparison with the total that would result if all the children of these ages were in school for 200 days. (2) The holding power of the schools, by which is meant the proportion of children between the ages of 14 and 17 who continue in school. The assumption here is that children of these ages are generally free to leave school if they so desire. (3) The quality of teaching provided. The average salaries of teachers, principals, and supervisors are taken as an indication of the quality of teaching provided. (4) The school environment, as shown by the value of property per child enrolled. (5) The percentage of literacy.

All of the data are for 1930. The following table taken from the Research Bulletin of the National Education Association for May, 1932, shows the relative standing of each of the States in each of the five features thus selected. The names of the States appear in the order in which they rate regarding the per cent of their urban population. Thus Rhode Island has 92.4 per cent urban population, while only 16.6 per cent of the population of North Dakota lives in urban conditions.

STANDING OF THE STATES ON FIVE FACTORS  
RELATED TO SCHOOL EFFICIENCY, 1930

States	Rank of the States for 1930 in:				
	Amount of at- tendance	Hold- ing power	Teach- ers' sala- ries	Value of school prop- erty	Liter- acy
1	2	3	4	5	6
Rhode Island . . . .	22	45	18	18	25
Massachusetts . . . .	2	17	4	8	18
New York . . . . .	8	16	1	1	16
New Jersey . . . . .	8	85	8	8	24
Illinois . . . . .	7	28	8	9	21
California . . . . .	6	1	2	2	7
Connecticut . . . . .	9	40	5	4	15
Michigan . . . . .	1	12	13	5	17
Ohio . . . . .	5	7	6	7	27
Pennsylvania . . . . .	20	33	9	15	22

The accompanying table should be read as follows. Rhode Island stands first in respect to urban population. It is twenty-second among the States in the percentage of children 5 to 10 years of age who attend school. It ranks forty-fifth in the per cent of children 14 to 17 years of age who remain in school. It is eighteenth in regard to the amount of average teachers' salaries. Its rank is thirteenth in respect to the value of school property per child enrolled, and it is twenty-fifth when rated upon the per cent of literacy of native born population.

The table shows some interesting conditions. In a general way, the States having the greatest proportion of urban population have the best record in regard to the attendance of pupils. There are, however, noteworthy exceptions. Maine, which ranks twenty-fourth in urban population, ranks fourth in school attendance, while Rhode Island, which ranks first in urban population, ranks twenty-second in attendance. The holding power of school systems is not closely connected with urban population. Idaho with a population predominantly rural is sixth among the States in attracting children 14 to 17 years of age, while Massachusetts, which ranks second in respect to urban population, is seventeenth in holding power.

As might be expected, the States having highest per cents of urban population generally pay the highest salaries to their teachers. Even in this matter, Arizona outranks Illinois and Pennsylvania. The same group of States that excel in regard to teachers' wages also rank high in the value of school property per pupil.

In the ratings for literacy there is the greatest variation in relative positions. The three highest positions in this feature are claimed by Nevada, Wyoming, and Montana, all predominantly rural in the character of the population.

**EEDEN**, FREDERIK WILLEM VAN. A Dutch physician and author, died in The Hague June 16, 1932. He was born in Haarlem in 1860 and studied medicine at the University of Amsterdam and psychopathology at the Universities of Nancy and Paris. In 1887, with Dr. Van Renterghen, he founded at Amsterdam the first clinic of psychotherapy in the Netherlands. His observation that most of the patients who came to his clinic for treatment were victims of social maladjustment, as well as physical disease, led to his establishing at Bussum about 1900 a model community, called Walden, where he carried out his theories of rehabilitating social misfits. He was also one of the leaders of the Dutch literary revival of the '80s. Among his works are: *Het Poortje* (1884); *De kleine Johannes* (1885); *Ellen* (1889); *Johannes Viator* (1892); *De Broeders* (1894); *Lied van Schijn en Wezen* (1895); *Lioba* (1897); *Blijde Wereld* (1903); *De nachtbluid* (1909); *Sirius en Siderius* (1912); *De Heks van Haarlem* (1915); and *Ismea* (1922).

**EGYPT**. A state in northeastern Africa, established as a nominally independent kingdom Mar. 15, 1922, following the termination on Feb. 28, 1922, of the British protectorate declared Dec. 18, 1914. Egypt's claim to jurisdiction over the Anglo-Egyptian Sudan is denied by the British. Capital, Cairo. Ruler in 1932, King Fuad I.

**AREA AND POPULATION**. While the total area of Egypt proper, excluding the Sudan, is about 380,000 square miles, the cultivated and settled area covers only about 13,600 square miles. The total population at the census of 1927 was 14,217,864, as compared with 12,750,918 at the census of 1917 and 9,734,405 in 1897. The estimated population in 1929 was 14,493,000. In 1930 births numbered 670,817 (645,217 in 1929); deaths, 367,118 (403,457). Populations of the leading cities in 1927 were: Cairo, 1,064,467; Alexandria, 573,063; Port Said, 104,603; Tanta, 90,016; Mansûra, 63,676; Asyût, 57,136; Faiyûm, 52,863; Zagazig, 52,839; and Damanhûr, 51,709. At the 1927 census, Moslems formed 91.19 per cent of the population; Christians, 8.34 per cent; Jews, 0.45 per cent.

**EDUCATION**. About 88 per cent of the population over 10 years of age were illiterate in 1927. In that year, of 4,734,071 children of school age, only 841,711 were attending school. Primary instruction is furnished mainly in native schools called *maktabs*. In 1930-31, there were 1938 *maktabs*, with 185,403 pupils enrolled. The University of El Azhar at Cairo, with its affiliated institutions, enrolled 2128 students in 1930-31. There were 7 higher colleges, and various special, technical, and secondary institutions.

**PRODUCTION**. Agriculture is the main support of the population and cotton is the chief money crop; in 1931 raw cotton comprised 70 per cent of

the value of all exports (74 per cent in 1930). The total cultivable area in 1929-30 was estimated at 8,239,185 feddans (feddan equals 1.038 acres), of which 5,790,050 feddans were under actual cultivation by 2,210,341 landowners. Of the cultivated area, 10 per cent was divided among 1,505,908 owners in plots up to one feddan, while 39.9 per cent, in plots of over 50 feddans, was owned by 12,815 owners. Agricultural workers formed 62 per cent of the total population. The cotton crop in 1931 totaled 1,286,000 bales (of 488 pounds each) from 1,746,890 acres, compared with 1,097,000 bales from 2,161,550 acres in 1930. Wheat, onions, sugar cane, beans, lentils, maize, millet, and rice are other products. Livestock in 1930 included 1,129,033 sheep, 795,546 buffaloes, 776,008 cows, 763,321 donkeys, 166,297 camels, and 35,866 horses.

The output of the leading minerals in 1931, with 1930 figures in parentheses, was: Petroleum, 290,000 tons (285,088 in 1930); phosphate, 242,205 (312,082); manganese, 100,195 (121,211). The manganese mines were closed down in 1932, due to lack of a market. The chief manufactured products are sugar, cigarettes, petroleum products, and articles for local consumption. The sugar industry was expanding as a result of the government monopoly established in 1930. The government in 1932 continued its policy of encouraging industrial development, chiefly through tariff protection.

**COMMERCE.** The adverse trade balance in 1931 was £E3,591,054 (\$16,892,655), compared with £E15,546,736 (\$77,598,423) in 1930. Imports were valued at £E31,528,167 (\$146,555,530), as against £E47,488,328 (\$237,028,490) in the previous year. Exports were £E27,937,113 (\$129,862,880), against £E31,941,592 (\$159,430,070) in 1930. Cotton exports in 1931 (amounting to 7,396,810 cantars of 99.05 pounds each) increased 24.8 per cent in volume over the preceding year, when they totaled 5,926,910 cantars, while the total value dropped 17.2 per cent to £E19,688,069 from £E23,788,474, in 1930. In 1932 imports totaled £E27,426,000 and exports £E26,987,000. The adverse trade balance was £E439,000.

The chief imports, in order of value, were cotton piece goods, iron and steel, fertilizers, coal, boilers and machinery, and wheat and corn flour. Imports came chiefly from the United Kingdom which supplied 22.6 per cent (20.4 in 1930) of the total; next came France, with 9.8 per cent (9.4); Italy, 9.2 (9.1); Germany, 8.0 (7.9). Exports went principally to the United Kingdom, which took 35.9 per cent of the total (34.5 in 1930); France, 12.8 (14.4); Germany, 9.1 (7.9); Soviet Russia, 6.1 (5.3); and Italy, 6.0 (6.2). Exports to the United States were valued at \$3,211,520 (\$9,785,940 in 1930) and imports from the United States were \$6,352,350 (\$11,030,040 in 1930).

**FINANCE.** Budget estimates for the fiscal year ending Apr. 30, 1933, placed revenue at £E37,492,520 and expenditure at £E37,309,639, as compared with £E39,316,000 and £E38,884,000, respectively, for 1931-32. The 1930-31 budget operations closed with a deficit of £E2,638,174, while those for 1931-32 showed a surplus.

The Treasury reserve fund on Apr. 30, 1931, amounted to £E37,950,791 (£E40,599,190 on Jan. 1, 1931), over 40 per cent of which had been immobilized in cotton. The national debt as of April, 1931, stood at £89,644,840 (sterling); the annual service charge for 1931-32 was £E4,101,-

903. In 1932, the Egyptian government advanced £E130,000 to the Anglo-Egyptian Sudan for the construction of a railway between Khartoum and Gebel Aulia, for use in construction of the £4,500,000 dam being built at the latter place. The Egyptian pound depreciated in sympathy with the pound sterling in 1931, the average exchange rate for the year being \$4.65, as against \$5 in 1930; in 1932 the average rate was \$3.58.

**COMMUNICATIONS AND PUBLIC WORKS.** In 1930, there were about 3358 miles of state-owned railway lines, besides 863 miles of private light agricultural lines. The new Cairo-Suez railway (about 80 miles long) was opened to traffic temporarily in 1931. In that year, railway revenues declined 25 per cent from the 1930 level. Highways in 1930 included 3760 miles of graded or drained dirt roads and 205 miles of macadam. Cairo is on the London-to-India air line and is a terminus of the Cape-to-Cairo air route. Work on the heightening of the Aswan Dam was continued during 1932. Steam vessels entering the ports of Egypt in 1930 numbered 9284, of 33,178,137 net registered tons; vessels cleared, 9293, of 33,215,392 tons. See **SUEZ CANAL**.

**GOVERNMENT.** Under the Constitution promulgated Oct. 22, 1930, Egypt was declared an independent hereditary monarchy, in which the King exercises full executive powers as well as legislative powers concurrently with Parliament. His other extensive powers include the right to veto all laws passed by Parliament, the sole right to initiate financial laws, to dissolve the Chamber of Deputies to which the Ministers jointly and separately are responsible, and the right to appoint and remove Ministers. He appoints 60 of the 100 members of the Senate, the other 40 being elected by indirect suffrage, as are the 150 members of the House of Deputies. The King also nominates the President of the Senate. The term of Senators is ten and that of Deputies five years; one-half of the Senate is renewed every five years. Prime Minister in 1932, Ismail Sidky Pasha, who took office June 21, 1930. The Parliament elected June 1, 1931, was boycotted by the Nationalist party (Wafd), which controlled 107 out of 121 Senators and 215 out of 235 Deputies in the previous Parliament. The Wafd also refused to recognize the new Constitution (see 1931 **YEAR BOOK**). Islam is the state religion and Arabic the official language.

**HISTORY.** Both Egypt's domestic situation and its relations with Great Britain remained in a relatively quiescent state during 1932. The Egyptian Nationalist (Wafd) party and the Liberal Constitutionals under former Premier Mahmud Pasha continued their opposition to the Sidky régime, but there was little of the violent rioting of 1931. An unsuccessful attempt was made to bomb a train on which Premier Sidky Pasha was riding on May 6. The suspended negotiations for a treaty settlement with Great Britain were not resumed, although Sidky Pasha informed Parliament in July that the Egyptian government was prepared to reopen negotiations when the proper time arrived. He indicated that the British government had been approached regarding the separate settlement of the capitulations issue. The reply apparently was that Britain considered it advisable to deal with this question later in the final treaty, in order to avoid haggling with other countries.

The session of Parliament which adjourned July 7 was occupied primarily with economic

problems, attributable in large part to the decline in cotton prices. The government was forced to intervene in the Cotton Exchange in March, when a rise of the pound sterling was reflected in a sharp fall in cotton prices. Regulations were established to prevent a precipitate fall in prices. On May 9, the government ceased to sell cotton, although its stocks were estimated at 400,000 bales. Private holders were said to be keeping some 600,000 bales off the market.

Other matters discussed by Parliament were the dam project at Gebel Aulia in the Anglo-Egyptian Sudan, which was approved; the enlargement of the harbor at Alexandria; and a new inner harbor in Lake Mariut. During the year the British, French, and Italian governments refused the request of the Egyptian government that they settle by negotiation the mode of payment of service charges on Egypt's foreign debt. In 1931, the government had announced its intention of paying interest and amortization charges, not in gold, but on the basis of the exchange value of the pound sterling.

The director of the Soviet trade bureau in Alexandria was expelled from the country in August, following the failure of the Soviet Union to purchase the anticipated large quantities of cotton from Egypt. He was also suspected of engaging in Communist propaganda.

**EGYPTIAN ARCHÆOLOGY.** See ARCHÆOLOGY.

**EL CAPITAN DAM.** See DAMS.

**ELECTIONS.** See UNITED STATES; also STATES AND COUNTRIES.

**ELECTRICAL APPLIANCES FOR THE HOME.** See ELECTRICAL INDUSTRIES.

**ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF.** A national organization representing the electrical engineering profession, founded in 1884. The objects of the institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, two junior past presidents, 10 vice-presidents, 12 directors, and a national treasurer.

In 1932 there were 60 sections of the institute located in various cities throughout the United States and 109 student branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to district, section, and student branch meetings. The 1932 winter convention was held in New York City, January 25-29; the summer convention in Cleveland, Ohio, June 20-24; and the Pacific Coast convention in Vancouver, B. C., August 20 to September 2. Much of the institute's work is accomplished through its general and technical committees, of which there were 43 in 1932. It maintains, in coöperation with other national engineering societies, the Engineering Societies Library and a national employment service. There are three grades of members: member, associate, and fellow. The total membership on Oct. 1, 1932, was 16,958.

The principal publications of the institute are the monthly *Electrical Engineering*, the quarterly *Transactions*, the *Standards* of the A.I.E.E., and the *Year Book*. The medals awarded by the institute in 1932 included the Edison Medal to Bancroft Gherardi, vice-president and chief en-

gineer of the American Telephone & Telegraph Co., for "his contributions to the art of telephone engineering and the development of electrical communication"; the John Fritz Medal, in conjunction with other engineering groups, to Michael I. Pupin, scientist, engineer, author, and inventor of the tuning of oscillating circuits and the loading of telephone circuits by inductance coils; and the Washington Award to William D. Coolidge, associate director of the research laboratory of the General Electric Co., for "his scientific spirit and achievement in developing ductile tungsten and the modern X-ray tube."

The officers of the institute elected for 1932-33 were: president, H. P. Charlesworth; junior past presidents, W. S. Lee and C. E. Skinner; vice-presidents, W. B. Kouwenhoven, W. E. Freeman, P. H. Patton, A. W. Copley, L. B. Chubbuck, J. Allen Johnson, E. B. Meyer, K. A. Auty, Stanley Stokes, and C. R. Higson; directors, J. E. Kearns, F. W. Peek, Jr., C. E. Stephens, A. B. Cooper, A. E. Knowlton, R. H. Tapscott, L. W. Chubb, B. D. Hull, H. R. Woodrow, G. A. Kositzky, A. H. Lovell, and A. C. Stephens; national treasurer, W. I. Slichter; national secretary, H. H. Henline. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

**ELECTRICAL INDUSTRIES.** There were a few outstanding achievements in the application of electric power in the industries in spite of reduced business activity. The Otis Steel Company placed in service the largest cold strip mill built so far. It is a 72-inch mill with two stands, each driven by a 1500-h.p. direct current motor operating between 200 and 400 r.p.m. while the reel is driven by a 400-h.p. motor automatically controlled to maintain any desired tension in the strip. For the gold mines at Noranda, Quebec, a very large hoist was installed to operate a skip hoist which raises 12,000 pounds of ore per trip from a depth of 4200 feet with a bucket speed of 2200 feet per minute and is driven by a 1500-h.p., 68-r.p.m. direct current motor taking power from a motor generator set driven by an 1800 h.p. synchronous motor. An ingenious device was added to a sheet rolling mill which automatically indicates and registers the length of sheet after each pass by means of a Selsyn motor on the rolls and a repeater placed in clear view of the man in charge.

Selsyn motors were also applied to each end of a heavy lift bridge so that the bridge tender can keep the bridge on an exact level as he causes it to rise and descend. Two repeaters in full view enable the operator to see what are the relative heights of the two ends without looking away from his controls. In elevator control electron tubes are now used for automatically stopping the car at the exact floor level. The three-electrode tubes are connected to an oscillating circuit including two coils, projecting from the moving car body and separated about one inch. Magnetic plates project from the stationary structure at each floor and as the elevator brings the magnetic field of the coils into close proximity of the plates the electrical balance of the tubes is changed, the plate-current of the tubes increases and this change operates a relay which stops the elevator.

Advances have been made in electrical control of steering for aeroplanes by interlocking the magneto-compass with the radio-compass and giving the combination automatic control of the

rudder. This combination can maintain the course direction exactly in spite of wind drift or changing velocity or direction of the wind. The radio-compass, of course, is supposed to be receiving signals continuously from a radio beacon located at the desired destination.

A new photo-electric recorder has been brought out which will give a record of measurements as accurate as the measurements themselves. Usually most recording mechanisms have so much inertia and friction that the record is much less accurate than the measurement. In this instrument the only power taken from the circuit to be measured is that required to deflect a galvanometer mirror. By a clever arrangement of stationary and movable mirrors the light beam is made to have unequal effect upon two photo-electric cells which cause a "follow-up" element to move an auxiliary shaft by means of auxiliary power so that this shaft always assumes the same angular position as the shaft of the measuring element. Thus the power to do the recording is taken from the auxiliary source while the measuring circuit merely has to move a beam of light.

The electric manufacturing companies have made an extensive study and done considerable development on "Air Conditioning" which means the heating or cooling, cleaning, revivifying and humidifying of the air in the rooms in which we live or work.

The most widely advertised example is the air conditioning of some of the high class railroad passenger trains but equipment has been put on the market for application in the home. The heated air is drawn through screens onto which warm water is dripping and thus carries humidity with it and mixes with the air of the rooms. It is now claimed that for health and comfort the air we breathe must have some ions in it and it is proposed to ionize the air by electrical discharges as well as clean and humidify it. One company developed an oil-burning house furnace in which the fuel oil is sprayed downward, meets a column of warm air flowing upward and the combustion takes place and the hot products mushroom outward against the water tubes. The oil is ignited by an electric spark and the whole operation is performed and controlled by electrical devices, so as to maintain a definite temperature.

Another interesting development is the use of the now almost universal electric refrigerating machine to cool houses in summer time by putting the cooling coils in the intake flue of a hot air system and forcing the air over them and to the rooms by means of an electric fan. This has been applied to motion-picture houses and railway trains, and some private homes.

The electric manufacturers are now also carrying on an energetic campaign to convince the housewife of the superior merits of the electric cook-stove. Several new lines and sizes were put on the market with new "high efficiency" calrod heating units in which the resistance wire is totally enclosed in a steel tube and this steel tube comes in direct contact with the bottom of the vessel to be heated, thus the heat is transferred by conduction rather than by convection or radiation. By means of careful use of heat insulation in the stove the amounts of power and energy required are reduced and some of the electric light and power companies are making attractive rates for energy for this purpose.

The simple household electric fan has been taken up by the scientists as a subject of study, particularly with respect to those properties which cause the well-known hum or buzz. As a result new fans have been brought out which are noiseless and which will give more air for a given power and size. In other words, the hum has been put to work.

In research the X-ray tube has been improved in design and new methods have been devised of supplying them with the high voltage required. Kenotrons give 85,000 volts and one-half ampere for commercial use. A combination giving 300,000 volts is used in industrial establishments and makes it possible to take pictures through four inches of steel to show whether there are any flaws in the steel.

Experiments upon the effect of cathode rays upon plants and animals are now quite popular among scientists. Any living organism may be killed by an excessive exposure but very curious effects are obtained by moderate exposures. Seeds of plants subjected to such exposure will produce plants having quite abnormal characteristics and appearance. It is possible to produce new types in this way, some of which are improvements over their predecessors. The work started by Luther Burbank may be much helped.

Radiotherapy is the name of a new art now being tried by the medical profession. It consists of producing local heating in the body of a person or animal or even a fever temperature by placing the subject or a desired part of the subject in the field of a very high-frequency, short-wave radio generating set. The part so exposed has a feeling of warmth throughout the inside. It is being tried as a remedy for rheumatism, arthritis, neuritis, etc. The effect of putting the whole body in the field is to produce a fever temperature of any reasonable degree. This, it is claimed, will give a favorable reaction in certain diseases on a similar theory that a malarial infection may improve a case of certain mental diseases. A number of reputable hospitals have installed these machines, known as "fever machines," and are experimenting upon their usefulness.

Research upon the effects of lightning have been carried forward by the construction of a "lightning generator" capable of giving 10,000,000 volts and improved devices to measure the effects of lightning have been added or improved. The new lightning generator gives double the voltage available a year ago.

An instrument, using an amplifier of vacuum tubes, has been developed which will indicate and measure a current of a millionth of a millionth of a millionth ( $10^{-18}$ ) of an ampere or six electrons per second. This is probably the smallest amount of power ever measured. The instrument is used in research work.

#### ELECTRICAL MARINE ENGINEERING.

Five of the six ships with electric propulsion which were mentioned last year as under construction for the U. S. Mail S. S. Co. have been completed and put into service. The sixth was severely injured by fire and is still under construction. Each of these ships is driven by two 5250-h.p. synchronous-induction motors with a shaft speed of 125 r.p.m. for 17.5 knots. For speeds up to 80 per cent of rating one of the two turbo-generator sets supplies power for both motors and above this speed both sets are required. On the trial trip the ships gave a speed

above 19 knots and had a fuel consumption of 0.69 pound of fuel oil per h.p. hr. including the steam supplied to the three 500-kw. auxiliary generators for miscellaneous power applications. There are 45 motor driven auxiliaries in the engine room, 45 ventilating fans throughout the ship, and all the apparatus for handling the ship is electrically driven, such as, winches, capstan, windlass, etc.

There were several Diesel-electric tow boats and tugs put into service, an example of which is the Navy Yard tug No. 119 which has two 260-kw., 250-volt d.c. generators driven by Diesel engines and one 640-h.p., 125-r.p.m. motor driving the propeller. The motor may be controlled from either the engine room or the pilot house.

The *Manhattan*, the largest ship ever built in the U. S. A., is driven by geared turbines but it has an electric plant of four 500-kw., 240-volt d.c. generators to supply power to its numerous auxiliaries. Two thousand kw. or 2700 h.p. would be the capacity of the propelling machinery on many ships. The ship has 383 motors totaling 4000 h.p. and 1200 fans.

A noteworthy change in practice is incorporated in the two new vessels known as *Seatrains New York* and *Havana* which carry freight cars, loaded and complete, between New York and Havana. All the auxiliary apparatus on these vessels is driven by a.c. motors instead of d.c. motors which have always been used in the past. The absence of commutator and brushes and convenience of total enclosure to protect from moisture and lesser weight give these motors advantages, but in the past their limited speed characteristics have made them inferior to the d.c. motor. The enormous improvement in a.c. motors in the last few years has overcome this handicap.

The use of the gyro for stabilizing ships is becoming practical and popular. One of the several methods used for controlling the gyroscope and causing it to come into action at the proper instant is by the use of one of the new electron tubes, the thyratron or grid glow tube. A very small pendulum on the ship may actuate the grid or trigger of one of these tubes and the tube itself will set in motion electrical machinery of hundreds of horsepower, if necessary, to do the work desired. A demonstration of this combination was made before the American Society of Naval Engineers.

A novel electric ferry was put into operation across the Sacramento River (Calif.). The ferry is driven by electric motors which take their power from an overhead trolley wire spanning the river. When it is necessary for a boat to pass up or down the river the trolley wire is lowered to the bottom of the river and this automatically cuts off power from the trolley wire.

The sonic altimeter (described in the 1931 YEAR BOOK) has been applied to navigation in the form of a sonic locator. The interrupted whistle note is sent out in a definite direction and if there is an obstacle, such as a ship or land, an echo comes back and the time required for the sound to go out and back indicates the distance of the object which is automatically indicated in feet.

**ELECTRICAL TRANSMISSION AND DISTRIBUTION.** The most important and most interesting subjects of study and investigation continue to be stability of systems and lightning protection. Forward steps are being

taken each year and new facts and theories have been added this past year. Installation of a newer high speed Oscillograph which automatically makes a record whenever trouble occurs has given valuable information and the installation of accurate high speed relays and high speed circuit breakers has reduced the trouble from instability.

Lightning is being investigated with a new instrument, a Surge Crest Ammeter, which will give a record of the maximum instantaneous current which flows as a result of a stroke of lightning, specifically the current which flows in a transmission tower when it or the ground wire is struck by lightning. The instrument consists of a small bar-shaped magnet made up of thin laminations of a special composition of cobalt steel having a very high magnetic retentivity. This is placed in a definite position with respect to one of the tower legs. When the tower is struck the instantaneous unidirectional current flowing in the leg magnetizes the bar to a definite degree depending upon the magnitude of the current. An inspector finds by testing with an ordinary compass that the bar has been magnetized, takes it to a laboratory where its magnetism is measured in a special device which indicates the value of the current necessary to produce that degree of magnetization.

All transformers to be placed on high-voltage lines are tested beforehand with a lightning surge generator which will impress any voltage desired as high as 10 million volts with a definite surge, for instance one in which the potential rises to its specified maximum in one-half a micro-second. At especially exposed places the transformers or insulators are protected by special devices which by-pass the lightning discharge to ground around the apparatus to be protected and then clear the ground afterward leaving the circuit in working condition. These are of two types: one of the de-ion type described before and the other of the expulsion type in which the gases formed by the arc act with explosive force to blow the gases away and let in fresh de-ionized air. Each of these will short and open the circuit within an interval of one-sixtieth of a second. Of more specifically technical interest is the improvement derived from connecting the ground side of the lightning arrester on the primary or high tension side to the neutral of the low tension side if the latter is well grounded. This completely by-passes the transformer and its auxiliary apparatus.

In the art of high voltage cables there were no unusual developments. A short cable transmission at 115,000 volts rated at 114,000 kv-a. was installed crossing the Columbia River under the water to save a long overhead span (Portland, Ore.). The insulation on this was 0.55 inch thick and the armor consisted of hard drawn copper wires instead of steel, thereby reducing the losses 30 per cent. In the research on cables it has been found possible to considerably reduce the thickness of insulation due to improvements in quality and technique. Thus a present day cable for 132 kv. would have the same thickness as a 66-kv. cable of a few years ago. A cable for 220 kv. is now a practicable thing if economically justified.

The use of secondary networks was well established some years ago and the use of primary networks is growing very rapidly. A considerable saving in copper or energy is effected thereby and

it is more adaptable to unexpected growth in load than the radial system which it supplants.

Primary networks at 4000 volts have been installed in many cities of about 50,000 population and in Boston and Pittsburgh. Its success results from the recently developed devices: Network protector, automatic regulator and improved relays. Factory built substations are now available which include the transformer and all protecting and regulating devices which it is merely necessary to set up on the site and connect the primary and secondary terminals to the two existing networks, the device having been tested at the factory.

In a test a single-phase circuit breaker operating on the de-ion principle has opened a circuit carrying 118,000 amperes at 7600 volts or about 900,000 kv-a. in one sixtieth of a second. Three of these in a three-phase circuit would interrupt 2,700,000 kv-a. Circuit breakers of both the de-ion and oil blast types are available which will interrupt 2,500,000 kv-a.

A new line of high speed direct-current circuit breakers was brought out for use in high-voltage railway work, particularly in connection with mercury vapor rectifiers. They are of the air break type, will open the circuit and bring the current on short circuit to zero in about one-sixtieth of a second. Some of the circuit breakers for direct current were interesting because they used silver for the main contacts and carbon alloy for the arcing contacts. The silver reduces the heating and is less likely than copper to oxidize and deteriorate the contact.

A new departure was the installation in Boston of a set of Phanotron rectifiers to convert from a.c. to 250 volts d.c. to be tied into the existing Edison three-wire system. This rectifier is rated at 250 volts and 600 amperes and consists of six tubes. The advantage is that such a converter may be installed close to the load centre with a minimum distance of distribution at 250 volts and all the rest of the distance is traversed at 13,800 volts. This minimizes the voltage drop and power losses and gives good regulation of voltage. Also this installation does not involve any difficulty of synchronizing or instability as do synchronous converters which are now universally used for the Edison three-wire system.

New types of supervisory control were developed. These are to enable a "power dispatcher" to read instruments and operate switches in one or more distant stations or sub-stations. This particular form called the Polarcode uses only two wires to the distant station and makes it possible to perform 25 different operations instantly without the lapse of time required for dialing and selecting. It will operate the gates of a water wheel, observe the voltage of the generator, connect to line, regulate the load, read the temperature of the generator or its bearings, and give many other pieces of information.

**ELECTRIC LIGHT AND POWER INDUSTRY.** The output of energy of the electric light and power stations in 1932 was 77.5 billion kw.-hr., a decrease of about 10 per cent from 1931. The gross revenue was \$1,979,000,000, a decrease of 8 per cent. From these figures we see that the average price received per kw.-hr. was 2.56 cents. New plant capacity added was 600,000 kw., mostly in steam plants. The amount of coal used in the plants using coal was 1.51 lb. per kw.-hr., 3 per cent less than last year. Statistics show

that the average ratio of operating expenses to gross revenue was 43 per cent and that taxes took 10 per cent of the gross revenue.

New technical advances were the two new installations of mercury boilers and turbines at Kearny, N. J., and Schenectady, N. Y., the new 150,000 kw. turbine for steam at 1200 lbs. for Chicago, and the idea of the outdoor unit or integral power plant as exemplified at Schenectady. Here a unit consists of the turbine, its special boilers and controlling apparatus completely separated from any other unit or boiler. It is stated that a steam plant using steam at from 600 to 1200 lbs. can be built for from \$60 to \$80 per kw. and can generate energy for 0.3 cents per kw.-hr. for power station costs only. It is estimated that a mercury turbine plant would cost about \$75 per kw.-hr. and can deliver a kw.-hr. for 10,000 b.t.u. at a cost not yet known for lack of experience.

Among the financial and political activities were the investigation of the public utility holding companies by the Federal Government, the decision of a court that a holding company should not borrow money from one of its operating companies and the decision of a Federal Court that the rate for gas set by the Kansas Public Service Commission was unjust and confiscatory. The receivership for the Midwest Utilities Corp. involving many of the Insull properties was an outstanding piece of bad news about the utilities.

**ELECTRIC LIGHTING.** There were 546 million incandescent lamps sold in the U. S. in 1932, a decrease of 2 per cent from 1931. There was a noticeable increase in the percentage of lamps sold for operation at 120 volts instead of 115 volts. A new lamp of only 3 watts rating at 115 v. was added to the available choice. This is convenient for sign lighting. A new line of incandescent lamps of a low price-range was brought out to compete with importations. These run from 7.5 watts to 60 watts, have a life one-half that of the standard grade, an equal efficiency, and sell for 10 cents apiece. There were many small lamps of Japanese make put on the market at a low price. An authoritative test on these lamps was published which showed that they consumed much more power than they were labeled and were lower in efficiency than American made lamps.

An agreement is being arranged between European and American manufacturers to settle upon a standard base and socket. With the present forms European made lamps will fit in American made sockets but American made lamps will not fit in European sockets.

A new lamp, known as the Photoflood lamp, has been brought out which enables photographers to make movies or take time exposures conveniently indoors and at night. This is made in a bulb of the 60-watt size, operates on circuits of 105 to 120 volts and gives a quantity of light equivalent to a 750-watt lamp with an increased proportion of actinic light due to the higher temperature of operation. This is obtained by the sacrifice of the life of the lamp which is only 120 minutes.

A radically new portable Illuminometer was brought out which requires neither batteries nor standardized lamp. It makes use of what has been named the Photronic Cell which consists of a disk on which has been deposited a light-sensitive material so that when exposed to

light an electro-motive force is generated which is proportional to the intensity of the light. The voltage produced is read on a suitable sensitive voltmeter whose scale is calibrated for light intensity in foot-candles. A new pyrometer lamp was produced which will measure the temperature of incandescent masses, as in furnaces, with an accuracy of a few degrees. It consists of a carbon filament in a blackened bulb with small windows diametrically opposite, so, on looking through, the object to be measured and a portion of the lamp filament are both in the field of view, side by side. By varying the current in the filament until the brightness of the two is matched the value of the current in the filament is a measure of temperature.

Ultra-violet lamps for theurapeutic work have been improved, made more convenient for use, cheaper and have been vigorously pushed commercially. The newest lamp, the S-2, being smaller than previous sizes, is more suited to homes, is rated at 130 watts but requires a transformer which is placed in the base of the stand and the whole combination takes 175 watts at 115-120 volts. (Lamp described in 1929 YEAR BOOK.) Another source of ultra-violet light is the Black Lamp which gives light that cannot be seen by the human eye and is made in a black bulb, but it will take photographs and of more importance gives attractive fluorescent light from certain common materials.

The new music hall in Rockefeller Center has the most elaborate system of lighting and control yet installed. It is an enlargement of the system described in the 1931 YEAR BOOK. All the lighting of stage and auditorium is controlled from an organ console in a pit in the orchestra in front of the audience. Here by touching the key board all degrees of intensity, all groupings, and all color effects are produced. There are 314 separate dimming controls which may be preset for five scenes. The dimming is by saturable reactors in a.c. circuits. For control of color screens there are 91 master or transmitting Selsyn motors and 584 receiving or repeating Selsyns which move the color screens in front of the light sources.

The art of flood lighting of buildings has advanced with the popularity of the practice and considerable expense is incurred for special features of architecture which will contribute to the artistic effect at night. The new building at 60 Wall St., New York, is a good example of modern practice. This building is a little less than 1000 ft. in height and is the tallest building in the lower district. It is brought out at night by 10-inch projectors of 250 watts throwing beams upward on the pilasters and by a large lantern of opal glass, at the top, having 1300 sq. ft. of surface illuminated from inside by 25,000 watts. The Washington Monument is now floodlighted, the main portion by flood lights on the ground near-by rating 5000 watts for each of the four sides. The top is illuminated by two searchlights of 1500 watts placed on other Federal buildings, 765 and 1530 ft. distant and this effect is maintained all night long as a warning beacon to aeroplanes.

**ELECTRIC TRANSPORTATION.** The latest statistics of railroad electrification issued in 1932 show that the United States of America stands first in mileage electrified with 2055 route miles, 3597 miles of main line track and 4911 miles of all tracks. Switzerland came second, Italy third,

and France fourth. In the whole world there are 11,318 miles of main line track operated electrically.

The Pennsylvania R.R. is the most important and while not yet finished it is expected that the New York-Philadelphia section will be completed and in operation in the spring of 1933. The overhead construction is being put up between Philadelphia and Wilmington. The Reading R.R. has added thirty additional two-motor cars with improved design of motors and control equipment. The New York Central has added a 3000 kw. rectifier in its Wakefield Substation and operates it in parallel with a 2000 kw. synchronous converter.

The St. Gothard Ry. of Switzerland has built some single-phase electric locomotives to rate at 7200 h.p. for a two-unit locomotive. Each unit has four driving axles and power will be taken from an overhead trolley at 15,000 volts and 16.7 cycles. The Soviet Government has placed in operation on electric power a heavy grade section of the Trans-Caucasian Ry. between the Caspian and Black Seas. Two 145-ton locomotives for operation on 3000 volts direct current were shipped from this country and six more are to be built in Russia. The Paris-Orleans Ry. of France has ordered built in this country a locomotive of 147.5 tons for high speed passenger service to operate on 1500 volts direct current at 87 miles per hour. It will rate at 3600 h.p.

Improvement continues in the engineering features of the usual urban trolley car, higher speeds are being attained and better schedules by the use of new motors of greater power and no greater weight. Field shunting gives the higher speed with no decrease in acceleration. A speed of 45 m.p.h. is being attained. The new control is of the commutator type with a greater number of steps, the control and power brakes being foot operated.

Diesel electric cars for railroads are now built to run on pneumatic tires on railroad tracks giving the passengers more comfort and reducing maintenance of the equipment. An example is one built for the Reading R.R. having a capacity of 47 passengers and weighing only 11 tons including the 125 h.p. power plant and one motor. The car has two six-wheel trucks, one of which carries the power plant and the other the traction motor.

Air conditioning is popular on main line railways and is now made available for trolley cars. A complete unit is made which takes power from the overhead trolley and supplies conditioned air to the interior of the car. The use of trolley busses or trolley coaches has increased. These take power from a double overhead trolley but require no track. They have a capacity of 30 to 40 passengers.

Signaling on main lines of railways has developed into a new art of electrical communication. The signals are carried right to the cab of the locomotive and placed in front of the engineer and are given by a light or sound device. In the operation of these signal systems there are 12,000 electron tubes in regular service and the records from this service show a life expectancy of 3000 hours for the tubes.

**ELMIRA COLLEGE.** An institution for the higher education of women in Elmira, N. Y., founded in 1852 and operating under its present charter since 1855. The enrollment for the autumn of 1932 was 424. There were 55 members on the faculty. The endowment of the college amounted to \$1,147,248; and the income for the year was \$404,983. There were 35,000 volumes in the library. President, Frederick Lent, Ph.D., D.D., LL.D.

**EMERSON, BENJAMIN KENDALL.** An American geologist, died in Amherst, Mass., Apr. 7, 1932. He was born in Nashua, N. H., Dec. 20, 1843, and was graduated from Amherst College in 1865, and with the Ph.D. degree from the University of Göttingen in 1870. After serving as instructor in geology at Amherst he was appointed in 1872 professor of mineralogy and geology. In addition after 1878 he occupied for almost 35 years the corresponding chair at Smith College. From 1890 to 1896 he was assistant geologist and from 1896 to 1920 geologist of the U. S. Geological Survey, for which he prepared a number of valuable geological maps of Massachusetts. He was vice-president of the American Association for the Advancement of Science in 1896, vice-president of the International Geological Congress at St. Petersburg in 1897, and president of the Geological Society of America in 1899-1900. He retired as professor emeritus in 1917 but was engaged until two years prior to his death in chemical and geological research work and writing.

**EMIGRATION.** See IMMIGRATION.

**EMORY UNIVERSITY.** An institution for higher learning in Atlanta, Ga., coeducational only in the upper division of the college and in the graduate and professional schools (except the school of medicine), founded in 1836. The enrollment for the autumn of 1932 was 1189, distributed as follows: college of arts and sciences, 486; school of business administration, 95; graduate school, 71; school of theology, 60; school of law, 63; school of medicine, 221; library school, 44. The enrollment for the 1932 summer session was 665. The faculty numbered 261. The endowment amounted to \$5,171,519, and the income for the year was \$764,091. There were 129,000 volumes in the library. President, Harvey W. Cox, Ph.D., LL.D.

**ENGLAND, CHURCH OF.** The Established Church of England. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King is the supreme governor of the church, possessing the right to nominate to vacant archbishoprics and bishoprics. The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonries, and the Lord High Chancellor to certain canonries. For administrative purposes, the country is divided into two provinces: The Convocation of Canterbury and the Convocation of York, each under the control of an archbishop.

The church assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provisions in respect thereof," consists of three houses, composed of bishops, clergy, and laity, respectively, the laity being elected every five years by the lay members of the diocesan conferences, which consist of representatives elected by members of the church. Every measure passed by the church assembly must be submitted to an ecclesiastical committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both Houses of Parliament. Parochial affairs are managed by parochial church meetings of parishioners and by church councils elected by such meetings.

In 1931 there were 2,428,334 Easter communicants in the 43 English dioceses. Incumbents numbered 12,773 and assistant curacies, 4083. There were baptized during the year 408,458 infants and 10,124 persons of riper years. The total voluntary parochial contributions from all sources amounted to £6,529,160.

The joint conference of representatives of the Church of England and of the Federal Council of the Evangelical Free Churches, with a view to the promoting of Christian unity in England, issued a letter as the outcome of meetings at Lambeth Palace on Oct. 21, 1932. The statement, signed by the Archbishop of Canterbury and the Rev. W. Lewis Robertson, moderator of the Federal Council of the Evangelical Free Churches, recognized that much coöperation had already been established but that there was room for a very great development in that direction.

The Archbishop of Canterbury addressed the General Assembly of the Church of Scotland in May in support of the invitation of the Lambeth Conference of 1930 to the Church of Scotland to enter into free and unrestricted conference with the Church of England and the Episcopal Church in Scotland. The invitation was accepted. The Archbishop of York took part also in a conference of representatives of the three churches in November.

The convocations of Canterbury and York passed resolutions agreeing to the establishment of inter-communion between the Church of England and the Old Catholics, in accordance with the decisions arrived at by the conference at Bonn in July, 1931, between representatives of the Anglican Communion and the Old Catholic Churches. At St. Paul's Cathedral on Sunday, September 18, Dr. Johannes Berends, Bishop of Deventer, together with eight clerical and lay members of *Cor Unum et Anima Una*, the leading

Old Catholic theological society of the Netherlands, communicated at the midday service of Holy Communion. This ceremonial act of intercommunion was arranged in thanksgiving for the decisions arrived at the Bonn Conference.

The church assembly met in session in February, June, and November at the Church House, Westminster. On June 16 Royal assent was given to the fiftieth measure passed by the assembly, i.e. the Benefices (Diocesan Boards of Patronage) Measure, 1932, which had received final approval in the assembly at its Spring session. Other legislative business embraced the Benefices (Purchase of Rights of Patronage) Measure, which received the final approval in November, the Benefices (Application of Income during Vacancies) Measure, and the Clergy Pensions (Widows) Measure. The two latter received general approval, equivalent to second reading in Parliament, and will again come before the assembly in 1933.

At the June session the report of a commission set up by the assembly in 1929 to inquire into the mode in which the principles and practice of almsgiving might best be expounded in this generation was presented. The assembly decided to send the report to the diocesan conferences with a request that it should be discussed and remitted to ruri-decanal conferences and parochial church councils for consideration of the principles enunciated by the commission. The assembly agreed also to set up a commission to examine the relationships of home and overseas church finance, with a view to stimulating contributions to the latter, and requested the archbishops to set up a commission to consider the reform of the constitution of the ecclesiastical commission and Queen Anne's bounty.

The convocations of Canterbury and York each held sessions in January and June. Resolutions were passed asking for the appointment of joint committees to draw up a provisional form of service for unction and imposition of hands and a similar service for imposition of hands without unction. In addition the upper house of Canterbury requested the primate to refer the question of the ministrations of the church to the insane to the committee on spiritual healing. The convocation of Canterbury set up also a joint committee to inquire into the meaning and obligation of the oath of canonical obedience.

The increased interest in the cathedrals of England, to which attention was drawn a year ago, was sustained throughout 1932. Through "The Friends" of various cathedrals and similar bodies much was done to bring the cathedrals more and more into touch with the general life of the church and the nation. During the summer months large numbers of the general public visited the cathedrals. The Duke and Duchess of York attended a special service on November 3 to mark the restoration of Lincoln Cathedral, for which a sum of £130,000 had been raised. The problem of restoration and repair is still a serious one in several of the cathedrals and progress has been made at Chichester, Salisbury, Peterborough, Bristol, and Newcastle, while further repairs have been found necessary to Wakefield and Southwell Cathedrals. The building of Liverpool Cathedral has made considerable advance.

In their second annual report the commissioners appointed under the Cathedrals Measure, 1931, stated that they had been profoundly impressed by the financial embarrassments of most of the cathedrals. The prior claims of the fabric

and the maintenance of services, in some cases the fall in value of agricultural properties, the expense entailed by the upkeep of the precincts with large and often historically valuable residences, and, above all, the great rise in prices which had taken place since the amounts deemed suitable for stipends and other requirements were fixed, threatened to frustrate the laudable aims which the Cathedrals Measure sought to attain.

The number of candidates for ordinations from Advent, 1931, to Advent, 1932, was 585, the highest number since the year 1914. The Bishop of Manchester, chairman of the central advisory council of training for the ministry, stated at the summer session of the church assembly, that one problem which the church was facing at that moment in some dioceses was not that there were not enough candidates for Holy Orders nor an ability to train them, but that in the present economic stringency the saturation point of capacity to absorb them had been almost reached.

The church assembly at its Spring session passed a resolution regarding the work of the central council for women's church work as being of great value and commending it as worthy of the support of the church. The lower house of the convocation of York considered, at its January sitting, the functions of deaconesses and, while approving of deaconesses being entrusted with certain work in assisting parish priests, reserved its opinion with regard to preaching and the reading of morning and evening prayer and the litany in church until the matter had been fully considered by the commission referred to above. The church assembly at its Autumn session expressed the opinion that, seeing that the laity were deeply concerned about the proposed permission to deaconesses to minister in the ordinary services in church (other than Holy Communion), it was desirable that the house of laity should have an opportunity of expressing an opinion as to the acceptability of such ministry to the laity generally before such ministry is permitted.

At the 105th Islington Clerical Conference at Church House, Westminster, which discussed "Protestantism Today," Prebendary Hinde announced the opening of a new Evangelical Theological College at New Barnet. The fourteenth Conference of Evangelical Churchmen at Oxford in April dealt with "The Way of Renewal" and adopted a resolution on intercommunion, recognizing the great need of reunion with Free Churchmen and believing that unity is promoted by giving sacramental expression to fellowship already existing. "The Reformation" was the subject at the nineteenth Conference of Modern Churchmen at Bristol in September. The Anglo-Catholic Congress Committee has been engaged throughout the year in connection with the celebration of the centenary of the Oxford Movement from July 8 to July 17, 1933.

Among the anniversaries celebrated during the year was the 1500th of the coming of St. Patrick, which was marked by a special service at Armagh in June at which the Archbishop of Canterbury preached and which was attended by the Primus of Scotland, the Primate of Wales, the Primate of All Ireland, the Primate of Ireland, and the Moderator of the Presbyterian General Assembly. In July the Archbishop of York took part in a commemoration service in connection with the 800th anniversary of the foundation of Rievaulx Abbey, while the Duke and Duchess of York were

present at a similar service to mark the 800th anniversary of Fountains Abbey. Another notable celebration was the Wren Tercentenary at St. Paul's Cathedral.

Several changes took place in the episcopacy during 1932. The Rt. Rev. C. F. Garbett, D.D., was translated from Southwark to Winchester, which see became vacant by the death of the Rt. Rev. F. Theodore Woods, D.D. The Rt. Rev. R. G. Parsons, D.D., Suffragan Bishop of Middleton, became Bishop of Southwark, the Rev. G. F. Fisher, M.A., headmaster of Repton, was appointed Bishop of Chester, following the resignation of the Rt. Rev. H. L. Paget, D.D., and the vacancy in the see of Lincoln, due to the retirement of the Rt. Rev. W. S. Swayne, D.D., was filled by the translation of the Rt. Rev. F. C. N. Hicks, D.D., from the Bishopric of Gibraltar.

The officers of the church assembly in 1932 were: chairman, the Archbishop of Canterbury; vice-chairman, the Archbishop of York; secretary, Sir Philip W. Baker-Willbraham; assistant secretary, Guy H. Guillum Scott; chairman of the house of bishops, the Archbishop of Canterbury; chairman of the house of clergy, the Dean of Norwich; chairman of the house of laity, the Earl of Selborne. Headquarters are at 8 Dean's Yard, Westminster, S. W. 1, London.

**ENGLISH ARCHITECTURE.** See ARCHITECTURE.

**ENGLISH LITERATURE.** See LITERATURE, ENGLISH AND AMERICAN.

**ENGLISH STUDIES.** See PHILOLOGY, MODERN.

**ENROLLMENT IN COLLEGES.** See UNIVERSITIES AND COLLEGES.

**ENTOMOLOGY, ECONOMIC.** In the field of applied entomology the year 1932 was marked by the appearance in North America of several Old World pests of importance, particularly a European sawfly in the spruce forests of Quebec, and the spread of other long established major forms into new territory. The latter included an outbreak of the pink bollworm in Florida, of the gipsy moth in Pennsylvania, of the alfalfa weevil in the San Joaquin valley of California as well as the continuous extension of others. Marked success has followed application of the biological method of insect control, through the establishment of natural insect enemies, especially that attending work with the citrophilus mealy bug in the citrus orchards of California and the citrus black fly in Cuba. Work with insecticides which has resulted in the discovery of more effective compounds that can be used with a reduced hazard to human life and at a reduction in cost is of far reaching importance.

**CODLING MOTH.** The codling moth was reported as from moderately to very abundant throughout the greater part of the country. It was particularly abundant in the central States having been more so in Illinois than at any time during the last 10 years. The fact that it was unusually destructive in Kansas was attributed to the heavy carry-over of moths from the preceding season, weather conditions favorable to the moth, and a very light set of fruit. Four years of work in Pennsylvania with codling moth bands had shown by the close of 1931 that properly prepared beta-naphthol, red-engine oil bands of corrugated strawboard prepared at a meagre cost prevented at least 95 per cent of the expected emergence of midsummer moths. Its toxicity persisted throughout the season, in large part pre-

venting emergence of moths from overwintering larvae.

**ORIENTAL FRUIT MOTH.** This moth was much more serious than usual as a result of the short crop of peaches and is on the increase throughout the Middle Atlantic, South Atlantic, and East Central States. Its spread continued having been found for the first time in Kansas. The work of colonizing the important fruit moth parasite *Macrocentrus ancylivora* in the eastern States over a period of three years has resulted in its becoming more abundant and widespread than ever before. In several peach growing localities it gives promise of becoming as valuable a check on the fruit moth as it continues to be in southern New Jersey and Delaware. Several parasites imported from Europe were liberated in various peach sections of the United States. Large scale bait-trap control work indicates in both Indiana and Georgia experimental areas that a reduction of 50 per cent or more in fruit infestations is possible by baiting large areas with traps in half of the trees.

**MEXICAN FRUIT FLY.** The Mexican fruit fly which was first discovered in southern Texas in 1927 appeared in the lower Rio Grande Valley in the late winter and early spring of 1932 in greater numbers than in any previous season. The infestation while still too light to cause direct damage of economic importance was scattered over a distance of approximately 70 miles, extending from Mission eastward to Brownsville. Fifty-two groves were found infested in Hidalgo County and nine in Cameron County. The mild winter and the large amount of fruit left on the trees until late in the season are considered to have been important factors in the increase. Outstanding in importance was the discovery that nicotine sulphate is an effective poison for use in place of the arsenical bait spray for the adult flies and a spray consisting of nicotine sulphate 0.5 per cent, molasses 10 per cent, and water 89.5 per cent, was used extensively in combating the pest.

**JAPANESE BEETLE.** The spread of the Japanese beetle, which has been continuous since its discovery in New Jersey in 1916, has in recent years increased in rapidity until at the end of the season of 1932 the area of continuous infestation covered some 7000 square miles. The practicability of traps as a supplement to lead arsenate application in reducing or checking infestation at points isolated from continuous infested zones was amply demonstrated. Placed during the summer outside the quarantined area, they captured Japanese beetles as far north as Augusta, Maine, Concord, N. H., White River Junction, Vt., and Detroit, Michigan. At a public conference held on March 25 to consider the advisability of revoking the quarantine maintained against the pest almost unanimous sentiment was expressed in favor of the restrictions and a decision, to such effect, was announced on June 7. An extension of the quarantine to cover parts of New Hampshire, Vermont, and enlarge the regulated areas in Virginia, Maryland, Massachusetts, New York, and Pennsylvania to become effective Jan. 1, 1933, was announced late in December.

**EUROPEAN CORN BORER.** Conditions favored the hibernation of the European corn borer, and its survival in the western area of its distribution was practically 100 per cent. It met with favorable conditions during the spring, but excessive heat and drought during July and August de-

stroyed the eggs and young larvæ on the corn leaves and prevented a notable increase. The two-generation strain spread in 1931 from the New England States southward and was found generally though sparsely scattered throughout the greater part of New Jersey and for shorter distances in other directions, resulting in a modification of the Federal quarantine, effective February 5. The spread of the one-generation strain occurring from New York State westward was less extensive, and the regulated area extended included only limited additions in sections of Indiana, Ohio, Pennsylvania, and West Virginia. Isolated infestations were found at one point in eastern Virginia, one in Kentucky, one in southwestern Indiana, and two in Wisconsin. Attempts were made to eradicate these infestations and they were not included within the quarantined area. The domestic quarantine and restrictions that had been maintained against the borer were revoked as of July 15, due to the failure to obtain funds sufficient to maintain effective control. All Federal restrictions on interstate shipments under that quarantine were cancelled on that date. In November the borer was found on five farms in two counties on the eastern shore of Maryland.

**MEXICAN BEAN BEETLE.** The winter survival of the Mexican bean beetle was the highest on record and three times as heavy as that of the previous year which also was a record year. This survival resulted in heavy beetle infestation and the extension of its range, particularly northward into Vermont, New Hampshire, and Maine. It spread westward into Illinois and now occupies the central part of that State 30 to 50 miles from the Indiana State line. It was well established over the southern quarter of Michigan. Work with various insecticides was continued, but the spray application of magnesium arsenate remains the most effective, with synthetic cryolite spray the best substitute.

**GIPSY MOTH.** Wind spread of first-stage gipsy moth caterpillars from territory to the east of the 30-mile-wide barrier zone along the New York-New England border was responsible for the infestation of new territory in southwestern Massachusetts and northwestern Connecticut. This necessitated more intensive scouting and treatment, including spraying. The eradication campaign against infestation discovered on Long Island in December, 1929, progressed satisfactorily. Late in July an infestation was discovered in an outstanding mountain district near Pittston, in northeastern Pennsylvania, which covered an area more than 8 miles long and 4 miles wide.

**MEXICAN BOLL WEEVIL.** The boll weevil continued to be the most important pest of cotton from middle Texas eastward. The very mild winter of 1931-32 allowed it to remain active and even in some areas to continue breeding throughout the usual hibernation period resulting in a carryover of from 4 to 18 per cent or the greatest recorded in 17 years, the average for which is about 1 per cent.

**THURBERIA WEEVIL.** The thurberia weevil which thrives under arid conditions that are fatal to the Mexican boll weevil and has long existed on thurberia plants which grow in canyons in the mountains of southern Arizona has in recent years adapted itself to cultivated cotton. The attempt to prevent its spread from eastern Arizona to other arid localities in western Texas, New Mexico, and Arizona where cotton is grown under irrigation was pressed. The finding of in-

festations in two fields in Pinal County led the State authorities to extend the quarantine line.

**ALFALFA WEEVIL.** The alfalfa weevil which has been present in the northeastern edge of California east of the Sierras for many years was discovered in the northern end of the San Joaquin Valley on May 12 and was later found to infest the alfalfa area in five counties. Steps were at once taken to introduce a well-established insect enemy of demonstrated utility from Nevada, where the parasite is well established. This parasite, *Rhyssalus curculionis*, introduced from Europe in 1911, is now considered as one of the controlling factors in much of the older infested territory.

**PINK BOLLWORM.** The pink bollworm, which next to the boll weevil presents the most serious menace to the American cotton crop, was discovered in June to infest cotton in southern Florida. Following the initial discovery of its occurrence in a two-acre plot of cultivated cotton at the Federal Plant Introduction Gardens near Miami, it was found infesting all of the wild cotton growing along the shore territory from Miami to Key West. Since the infested region was some 400 miles from cotton growing areas, there was considered to be little danger of spread to cultivated cotton. At a meeting of Federal and State officials of near-by cotton-growing States held on June 11 it was decided to take immediate steps to eradicate the infestation and to prevent any spread during the eradication work. The removal of wild cotton plants was immediately commenced by Federal and Florida State officials cooperating. Early in October it was found infesting cotton at several points in northern Florida and on October 29 six counties of north central Florida were placed under a quarantine in addition to five counties in southern Arizona, seven counties in southern New Mexico, and 16 counties and parts of one additional county in western Texas. In the Valley of the Upper Rio Grande and notably the Big Bend area it increased in 1932 and the infestation was heavier than ever before, following the considerable increase in 1931. This is the only district in the country where it has increased sufficiently to become a real factor in commercial cotton production.

**DATE SCALE ERADICATION.** The eradication of the date scale in the extreme Southwestern States approached completion and apparently had already succeeded in Arizona. In California two infested date palms were found on two properties in the Coachella Valley and 14 infested date palms and 43 other palms on seven properties in the Imperial Valley.

**GRASSHOPPER MENACE.** Grasshoppers representing several species which caused such unprecedented devastation in the Great Plains States the preceding year were again the source of much loss. The devastation threatened by the widespread egg deposition that took place in the fall of 1931, of which nearly 100 per cent survived the winter, was checked by the cool and backward spring in South Dakota, Nebraska, and Iowa, as well as in other States, causing the grasshoppers to hatch out from 2 to 4 weeks later than in 1931. During the late spring, and particularly May and June, there were abundant driving rains over much of the infested area which served to destroy many at or shortly after their hatching out and delay the hatching of others well into or through June. Such conditions were favorable to the growth of abundant roadside and grassland

vegetation where the hatching was taking place and held the young grasshoppers long enough to permit the small grain crops to mature and be harvested in good condition. The very abnormal climatic conditions which produced the natural control must be looked upon as strictly providential. The excessive rainfall with the resulting destruction of young grasshoppers did not extend to North Dakota and Minnesota, where growing crops were subjected to the full attacks of the insects. The control obtained in these States was due altogether to the very extensive distribution of poison bait throughout the more heavily infested sections. In some instances, single applications of the bait covered the ground with what amounted to almost a mulch of dead grasshoppers. The results of such poisoning fully demonstrated the utility of this means of control. Experimental work led to the important discovery that when eggs are covered with four inches of soil there is no spring or summer emergence.

**NEW INSECT PESTS IN THE UNITED STATES.** From time to time new insects appear or are recognized for the first time through their becoming of importance by the attack of economic plants or animals. Some may be indigenous forms that have adapted their habits to attack new food plants and others may have been unwittingly introduced from abroad. Among such is the gladiolus thrips, *Taeniothrips gladioli*, which first appeared in the United States in 1931 and has caused serious damage in the North Eastern and North Central States by its attack upon the flowers and foliage. It was quite generally reported in 1932 as damaging gladioli from New England through the Middle Atlantic States and in Tennessee and Minnesota. The pear-leaf-curling midge, *Dasyneura pyri*, a European pest of considerable importance, was discovered in May, 1931, attacking pears in orchards in the Hudson Valley of New York. A lily bulb thrips, *Liothrips vanecckei*, introduced from the Old World and first reported in the United States from New York in 1925, has become quite generally distributed and the source of some injury. The well known cottony cushion scale was found in 1931 to have been introduced into Puerto Rico. A new curculionid weevil, *Anacetrinus subnudus*, appeared in Louisiana as an enemy of sugar cane. A European sawfly, *Diprion polytomum*, was discovered in the Gaspé Peninsula of the Province of Quebec in November, 1930, partially defoliating stands of white and black spruce. In an airplane survey made in 1931 it was found to infest more than 2000 square miles in a territory where some 6 per cent of the trees had already been killed by the eastern spruce beetle.

**INSECTICIDES AND INSECT CONTROL.** Progress continued to be made in the search for new and improved insecticides. Rotenone has been found to be 15 times more toxic than is nicotine, which has been one of our most important insecticide materials, and 30 times as toxic as lead arsenate, to certain caterpillars and at the same time harmless to man and domestic animals when taken by the mouth. It appears to approach the nearest of any known material to the requirement for an ideal insecticide. The use of pyrethrins which are effective contact insecticides and are non-poisonous to man appears to be limited by their high cost. The discovery of rotenone in the devil's shoestring, a weed of the pea family found quite generally distributed in the eastern United States, was reported in November. It is

believed that the discovery will render it possible to obtain this insecticide from a plant grown easily in the United States and its cost be greatly reduced. Ethylene oxide, ethylene dichloride, and propylene chloride alone or preferably in admixture with carbon dioxide are the newest, most effective and probably the safest materials for fumigating foodstuffs. A mixture of three parts by volume of ethylene dichloride and one part by volume of carbon tetrachloride previously reported as effective against stored product pests has now been shown to serve as a safe, convenient, and practical household fumigant for clothes moths and carpet beetles. Work brought to a conclusion after several years of effort has shown that carbon disulphide can be used as a practical, efficient means of control for wireworms when a dose of at least one ounce is placed at a depth of 4 inches in a loose damp soil with a diffusion distance of 17 inches.

**PARASITES AND INSECT CONTROL.** One of the outstanding successes in the natural control of economic insects was registered in the suppression of the citrus black fly in the American tropics through the introduction and establishment of important Malayan insect parasites and predators. For many years a serious obstacle to the citrus industry in Cuba and elsewhere in the American tropics following its discovery in Jamaica in 1913, its threat to the citrus industry of the United States led to the introduction of insect enemies of which the wasp-like parasite *Eretmococcus serius* has effected commercial control in most of the groves in Cuba where early liberations were made. The Sicilian mealybug parasite *Leptomastidea abnormis* introduced into California in 1914 and into Florida in 1917 to combat the citrus mealybug was found parasitizing the Mexican mealybug in greenhouses at Urbana, Ill. The woolly aphis parasite *Aphelinus mali* introduced into Oregon from Michigan in 1929 has now become thoroughly established in over 40 Hood Valley orchards and is spreading rapidly. The continued control of the citrophilus mealybug by the two wasp-like parasites introduced into California from Australia which became generally established by 1929 was reported in March. The annual saving to the citrus industry brought about by these parasites in Orange County alone was found in the course of a survey to be more than half a million dollars. The discovery that a wasp-like parasite *Perilitus* attacks adult flea beetles was reported, field collections in Ohio having shown a parasitism of approximately 70 per cent.

**NECROLOGY.** The year saw the passing of the dean of American entomologists in the death of Dr. W. J. Holland at his home in Pittsburgh on December 13, at the advanced age of 84. Dr. Holland, who at the time of his death was Director Emeritus of the Carnegie Museum of Pittsburgh, was best known as author of *The Butterfly Book* and *The Moth Book* which contain descriptions and colored plates illustrating nearly all of the North American forms of butterflies and a large proportion of the larger moths. The death of Sir Ronald Ross, famed for his discovery of the transmission of malaria by the anopheline mosquitoes, occurred in London on September 16, in his 76th year. Prof. Anthony Spuler, well known as an investigator of fruit insects in the State of Washington, was accidentally drowned on May 30, at the age of 42.

**BIBLIOGRAPHY.** Works on entomology included:

E. Balfour-Browne, *A Test Book of Practical Entomology* (London, 1932); C. T. Brues and A. L. Melander, *Classification of Insects* (Cambridge, Mass., 1932); A. H. Clark, *The Butterflies of the District of Columbia and Vicinity* (Washington, D. C., 1932); Compiled, *Iconographia Insectorum Japonicorum* (Tokio, 1932); K. Escherich, *Die Forstinsekten Mitteleuropas. Ein Lehr- und Hand Buch* (Berlin, vol. 3, 1931); J. R. Eyer, *Laboratory and Field Manual of Economic Entomology* (Ann Arbor, Mich., 1932); E. P. Felt and W. R. Rankin, *Insects and Diseases of Ornamental Trees and Shrubs* (New York, 1932); R. Matheson, *Medical Entomology* (Springfield, Ill., 1932); C. L. Metcalf and W. P. Flint, *Fundamentals of Insect Life* (New York and London, 1932); H. Ross, *Practicum der Gallenkunde (Cecidologie)* (Berlin, 1932); S. Rostrup and M. Thomsen, *Die Tierische Schädigung des Ackerbaues* (Berlin, 1932); F. X. Williams, *Handbook of the Insects and Other Invertebrates of Hawaiian Sugar Cane Fields* (Honolulu, 1931).

**ERITREA**, *ä'rë-trë'a*. An Italian colony on the African coast of the Red Sea, extending 670 miles from Cape Kasar to Cape Dumeirah on the Strait of Bab-el-Mandeb. Area, 45,754 square miles; population (1931 census) 621,776. The capital is Asmara, with a population of 23,500 (3500 Europeans). Massawah is the principal trade centre, with a population of 12,275. The natives are chiefly Coptic Christians and Mohammedans. The culture of coffee, cotton, tobacco, flax, bananas, and agave (a fibre plant) has been successfully introduced. Gold in appreciable quantities was found around Asmara during 1932 and the Bank of Italy purchased 25 pounds of Eritrean gold. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products.

Imports by sea and land in 1930 were valued at 176,814,828 lire (about \$9,194,370) and exports at 74,982,297 lire (\$3,899,000). The lire averaged \$0.0521 in 1931. The budget for the 1931-32 fiscal year estimated colonial revenue at 51,085,630 lire, the contribution from the Italian government at 27,700,000 lire, civil expenditures at 35,346,580 lire, and military expenditures at 15,739,050 lire. There is a military force of 200 Italian officers and 4000 native troops. King Victor Emmanuel visited Eritrea during the summer. Governor in 1932, Riccardo Astuto.

**EROSION**. See SOILS.

**ESKIMO**, ORIGIN OF. See ANTHROPOLOGY.

**ESSAYS**. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE, ETC.

**ESTONIA**. A republic on the eastern shore of the Baltic, bounded by the Gulf of Finland on the north, Union of Soviet Socialist Republics (Russia) on the east, and Latvia on the south. Capital, Tallinn (Reval).

**AREA AND POPULATION**. The total area is about 18,358 square miles and the estimated population in 1931 was 1,120,000 (1,107,059 at the 1922 census), of whom about 87.7 per cent were Estonians, 1.7 per cent Germans (Balts), and 10.6

per cent Russians and others nationalities. The populations of the chief cities at the 1922 census, with 1930 estimates in parentheses, were: Tallinn (Reval), 122,419 (131,429); Tartu (Dorpat), 50,342 (60,933); Narva, 26,912 (25,205); Pärnu, 18,499 (20,885). Births averaged 19,653 annually for the period 1926-30 and deaths, 18,393. Five-sixths of the population are Lutherans.

**EDUCATION**. Primary education is free and compulsory. In 1929-30, there were 1292 primary schools, including 29 private schools; 78 middle schools (25 private), and various special and professional schools. Tartu (Dorpat) University had 3474 students in 1930 and the Technical Institute at Tallinn, 539. At the 1922 census, 5.6 per cent of the population over ten years of age were illiterate.

**PRODUCTION**. About 70 per cent of the population is engaged in agriculture and dairy farming. Arable land in 1930 totaled about 2,537,000 acres; meadow and pasture, 4,379,000 acres; forests, 2,220,000 acres. At the beginning of 1931, there were 33,093 workers employed in 757 large and medium-sized industrial enterprises, the chief industries being the production of textiles, paper, and timber. Production of the chief crops, in metric tons, in 1931 was: Wheat, 46,000; rye, 147,000; barley, 128,000; oats, 164,000; mixed grain, 92,000; flax fibre, 5647; flax seed, 6400; potatoes, 854,000.

Production of the chief crops in 1931, in bushels except as indicated, was: Wheat, 1,738,000; rye, 5,820,000; barley, 5,918,000; oats, 11,296,000; potatoes, 31,398,000; linseed, 253,000; flax fibre, 269,100,000 pounds. Livestock in 1931 included 669,000 cattle, 479,000 sheep, 323,000 swine, and 207,000 horses. Industrial production in 1930 included: Cotton fabrics, 24,617,000 yards; cotton yarn, 10,644,000 pounds; wood pulp, 17,682,000 metric tons; cellulose, 56,253,000 metric tons; paper, 77,152,000 pounds; sawn timber, 9,573,000 cubic feet; matches, 119,000,000 boxes; hides and skins, 612,000; oil shale, 498,000 metric tons. The number of registered unemployed was 9055 on Dec. 31, 1931, and about 5000 on June 30, 1932.

**COMMERCE**. Imports in 1931 were valued at 61,224,000 crowns (98,369,500 in 1930) and exports at 71,073,000 crowns (96,433,800 in 1930). The crown, or kroon, equals \$0.268 at par. Dairy produce, timber, textiles, and paper were the leading exports; grain and flour, raw cotton, fish, textile products, metals, and machinery were the leading imports. The United Kingdom and Germany are Estonia's leading customers, while imports are supplied chiefly by Germany, the Soviet Union, the United Kingdom, Poland, and Sweden.

**FINANCE**. Budget operations for the three years 1930-31 to 1932-33 are shown in the accompany-

#### ESTONIAN BUDGET OPERATIONS

	Revenues		
	1930-31 (actual)	1931-32 (budget)	1932-33 (budget)
Current accounts ..	83,520,000	83,831,000	77,738,000
Capital accounts ..	13,659,000	6,453,000	4,718,000
Total .....	97,179,000	90,284,000	82,456,000
	Expenditures		
	1930-31 (actual)	1931-32 (budget)	1932-33 (budget)
Current accounts ..	83,013,000	80,614,000	73,501,000
Capital accounts ..	13,955,000	9,430,000	8,755,000
Total .....	96,968,000	90,044,000	82,256,000

ing table, in Estonian crowns (kroons), worth \$0.2680 at par. The fiscal year ends March 31.

The total public debt Mar. 31, 1931, was equivalent to \$33,193,000, including the internal debt of 5,319,000 kroons (\$1,425,000).

The foreign debt on Jan. 1, 1931, was distributed as follows: Owed in United States, \$16,466,012; in United Kingdom, £1,211,224; in Sweden, 8,357,408 kronor.

**COMMUNICATIONS.** Estonian railways (extending 1175 miles in 1930) and the telegraph and telephone systems are state owned. Highways in 1930 totaled 14,424 miles. A total of 2648 vessels, of 978,047 tons, entered the ports during 1930, and 2637 vessels, of 970,302 tons, cleared. Tallinn (Reval) is the chief port. The merchant marine (1931) comprised 93 steamers of 70,353 tons, and 280 sailing vessels, of 25,018 tons.

**GOVERNMENT.** According to the constitution of Dec. 21, 1920, executive power is in the hands of a state head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. Provision is made for referendum and legislative initiative. The composition of the State Assembly following the elections of May 11-13, 1920, was as follows: Socialists, 25; Farmers Union, 24; Settlers, 14; Radicals, 10; Populists, 9; Workers' party, 6; Minority Nationals, 5; Christian party, 4; and Houseowners, 3. Prime Minister and State Head at the beginning of 1932, Konstantin Päts (Agrarian), leading a coalition of Agrarians, Socialists, and others formed Feb. 12, 1931. For 1932 changes, see *History*.

**HISTORY.** Three cabinet overturns and the election of a new State Assembly featured Estonian political developments during 1932. The drastic measures adopted by the Päts Cabinet in 1931 in an effort to maintain the gold standard achieved their major object but failed to improve perceptibly the economic condition of the country. To improve the situation of the farmers, the government early in the year took steps to reduce the legal interest rate from 11 to 8 per cent. The opposition of industrial workers to the government policy of reducing salaries and curtailing budget expenditures led to mass meetings of the unemployed in Narva, Parnu, and Tartu on January 10. Later in the month the coalition supporting the government was weakened by a reshaping of the political parties and on January 29 the Päts Cabinet resigned.

It was February 21 before a new cabinet was formed under former State Head Jaan Teemant (Agrarian). Composed of representatives of the new Agrarian party (a coalition of Agrarians, Settlers, and Houseowners) and of the new National Centre party (coalition of Workers, Nationalist, and Christian parties), the Teemant Cabinet was merely a stopgap affair. It held office until the State Assembly, elected May 21-23, appointed a new government on July 21, which was headed by Karl Einbund (Agrarian), a former Minister of Interior. It was the 25th ministry to hold office since Estonian independence was proclaimed in 1918.

The May elections resulted in a gain of four seats for the Agrarian party, a loss of two seats by the National Centre, a loss of three seats by the Socialists, and a gain of three by the Russian minority party. The composition of the new As-

sembly was: Agrarian, 42; Centre, 23; Socialist, 22; Left parties, 5; Russian minority, 5; German minority, 3. Failing to maintain a working majority in the State Assembly, the Einbund Ministry resigned late in October and on November 1 a National cabinet was formed representing a coalition of the Agrarian, Socialist, and Populist parties. The leading figures in the new government were: Konstantin Päts (Agrarian), State Head; August Rei (Socialist), Minister of Foreign Affairs; and Ado Anderkopp (Populist), Minister of Justice and Interior. The economic programme of the Päts Cabinet called for a considerable extension of governmental control over privately-owned enterprises.

With the exchange of ratification documents at Tallinn Aug. 18, 1932, an Estonian-Soviet non-aggression pact signed May 4 and a conciliation convention signed June 16 both went into effect. In September, 1932 the Estonian government notified the U. S. Treasury Department that it would take advantage of the option granted in the debt-funding agreement by postponing for two years the payment of principal on its debt to the United States, \$90,000 of which was due Dec. 15, 1932.

**ETHIOPIA (ABYSSINIA).** A landlocked empire of East Africa, bounded by the Anglo-Egyptian Sudan on the west, Eritrea and French and British Somaliland on the north and northeast, Italian Somaliland on the southeast, and Kenya Colony on the south. Capital, Addis Ababa, with a population of about 65,000. Emperor in 1932, Haile Selassie I.

**AREA AND POPULATION.** With an area of about 347,490 square miles, approximating the combined area of Texas and New Mexico, Ethiopia has a population of approximately 10,000,000. The Abyssinians proper, Christians of Hamitic origin who constitute the ruling race, number less than 3,000,000. The Gallas, comprising two-thirds of the population, Somalis, and Danakil are other important tribes. Besides the capital, Dire Dawa, with about 40,000 inhabitants, and Harar, with 30,000, are the chief cities.

**PRODUCTION.** Agriculture and stock raising are the principal industries. The chief export products, in order of importance, are coffee, hides and skins, beans, flour, wax, civet, and ivory. Coffee is cultivated in Harar Province, eastern Ethiopia, but grows wild in the western districts. Grain, cotton, sugar cane, dates, and grapes are grown for local consumption. Valuable forests and mineral deposits remain largely unexploited due to lack of transportation facilities. The minerals found include iron ore, placer gold, potash, coal, copper, silver, and platinum.

**COMMERCE.** Foreign trade is carried on chiefly over the Franco-Ethiopian Railway from Djibuti on the coast of French Somaliland to Addis Ababa. In 1931, exports via this route totaled 27,792 metric tons (24,950 in 1930) and imports amounted to 32,685 metric tons (42,162 in 1930). Over other trade routes, via the Anglo-Egyptian Sudan, French and British Somaliland, Eritrea, and Kenya Colony, exports in 1930 were reported at about 8300 metric tons (7180 in 1929) and imports at 14,000 tons (16,364). The leading imports were cotton piece goods, kerosene, salt, sugar, and building materials.

**FINANCE.** Government revenues consist chiefly of taxes in kind and cash; the former are roughly estimated at between \$5,000,000 and \$6,000,000 annually, and the latter around \$1,000,000. The

Maria Theresa silver dollar (thaler) is the only currency in general use; the exchange value depreciated from \$0.30 in January, 1930, to \$0.2145 in December, 1931. On Oct. 12, 1931, the government took over the Bank of Abyssinia and the name was officially changed to the Bank of Ethiopia.

**COMMUNICATIONS.** The only railway is that from Djibuti to Addis Ababa, a distance of 488 miles. A highway (35 miles long) from Dire Dawa, on the railway, to Harar was completed in 1931 and work was begun on a projected 175-mile highway from Addis Ababa to Jiren in Jimma Province. Primitive roads and caravan tracks total about 2050 miles. A bus line between Addis Ababa and Addis Alem (40 miles to the west) was inaugurated in 1931. Telegraph and telephone lines linked the capital with the other leading cities.

**GOVERNMENT** Ethiopia is an hereditary and virtually absolute monarchy, although after 1907 the ruler was assisted by a cabinet and, after 1910, by a council of elders. On July 16, 1931, Emperor Haile Selassie I promulgated a constitution, establishing a two-chambered parliament with responsible Ministers to carry out its decisions, subject to approval of the Emperor. Members of Parliament were to be designated by the Provinces, subject to royal consent. The Crown was secured to the ruling dynasty.

**HISTORY.** Considerable discontent was manifested by the powerful nobles and tribal chieftains during 1932 at the centralizing policy of the Emperor, who was gradually taking over many of the powers formerly exercised by rulers of various regions. In view of this discontent the escape in June of Lij Yasu, the former Emperor, from the custody of his cousin Ras Kassa, who had held him as a state prisoner since 1921, was considered significant. Lij Yasu fled to the Province of Gojjam but on the orders of the Emperor was arrested June 11. Later Ras Hailou, governor of Gojjam, was arrested on a charge of plotting against the Emperor and was convicted by 500 peers and the Ethiopian Parliament. The Emperor commuted the death sentence but banished the prisoner and confiscated all his feudal rights and privileges, appointing Ras Emerou as Governor of the Province. On October 10, it was reported that the son of Ras Hailou had revolted against the Emperor and seized Debra Marcos, the former residence of his father. The revolt was subsequently crushed.

The Emperor's turbulent subjects embroiled him in difficulties with several foreign governments during the year. Addison E. Southard, United States Minister in Addis Ababa, was knocked down in a scuffle in a village near the capital January 18 after his automobile had struck and slightly injured a woman. On representation of the American State Department, the Ethiopian government tendered apologies and sentenced ten of the natives involved to the equivalent of life imprisonment. Secretary Stimson asked for a measure of clemency for those sentenced. On March 21 and 22, some 600 Ethiopians of the Gila Anuak tribe raided the Upper Nile Province of the Anglo-Egyptian Sudan, carrying off 800 cattle and 82 natives.

Early in the year Lords Noel-Buxton and Polwarth visited Addis Ababa to investigate slavery in Ethiopia on behalf of the Anti-Slavery and Aborigines Protection Society of Great Britain. In response to their representations, Emperor

Haile Selassie promised to bring slavery, which was an integral part of the social life of the country, to an end within 15 or 20 years. As steps toward the abolition of slavery through propaganda, rather than by force, the Emperor set up over 50 special slavery courts, brought Deputies from the Provinces to hear slavery reforms discussed in Parliament, and emancipated outright a few hundred slaves. He had furthermore adopted most of the transitional measures suggested by the Temporary Slavery Commission of the League of Nations in 1925.

The reconnaissance report of the American engineers who surveyed the Lake Tsana dam site in 1930 and 1931 was submitted to the government early in 1932, but no decision was made regarding further development of the project.

**EVANGELICAL CHURCH.** A denomination formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a movement started in 1800 by the followers of Jacob Albright for the religious and spiritual awakening of the German communities in Pennsylvania. In 1892 a number of ministers and members organized themselves into a separate denomination, known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions which drew up the so-called enabling act. The new organization was officially established in Detroit, Mich., in 1922.

In 1932 the denomination had 25 conferences in the United States, two in Canada, one in Japan, three in Germany, and one in Switzerland. There was a total membership of 265,245, of whom 227,472 were in the United States and Canada. Churches numbered 2579, of which 2078 were in the United States and Canada; they were served by 1959 itinerant preachers and 459 local preachers. The enrollment in 2777 Sunday schools was 373,545. The Christian Endeavor Society membership was 64,790. There were also 1180 women's missionary societies in the United States and Canada with a membership of 35,973, working under the general direction of the board of missions. The total value of all church property was \$36,621,889, while the amount of money raised during the year was \$5,568,825.

The chief schools of the denomination are: North Central College and the Evangelical Theological Seminary in Naperville, Ill.; Western Union College in Le Mars, Iowa; Albright College and the School of Theology in Reading, Pa. It maintains also two orphanages and five old people's homes in the United States, as well as

several hospitals. Official periodicals are the *Evangelical-Messenger* and *Christliche Botschafter*, published in Cleveland, Ohio. A quadrennial general conference was held in Milwaukee, Wis., in October, 1930. All questions of law in the interval between general conference sessions are decided by the board of bishops, which in 1932 consisted of Bishops L. H. Seager, M. T. Maze, J. F. Dunlap, J. S. Stamm, G. E. Epp, and S. J. Umbreit. Headquarters are at the Evangelical Press, 1900 Superior Avenue, Cleveland, Ohio, and in Harrisburg, Pa.

**EVANGELICAL SYNOD OF NORTH AMERICA.** THE. A religious communion strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. When they disagree the Evangelical Synod adheres to the pertinent passages of Holy Scripture and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was founded in 1840 at Gravois Settlement, Mo., and was consolidated in 1877 with similar communions. It is organized into 20 districts and has a synodical administration, with legislative powers vested in the biennial district conferences and the quadrennial general conference; the congregations are self-governing in strictly local affairs.

The Evangelical Synod of North America, in 1931, had 1244 congregations, 1197 pastors, and 259,896 individual members, also 1160 Sunday schools with an enrollment of 210,346. Money raised by the congregations for all purposes amounted to \$5,099,461, while the total value of church property was \$44,070,192. The home mission board, which reported a total income of \$115,526, employed 113 pastors in 126 fields in the United States. The foreign mission board, which reported a total income of \$175,904, employed 36 missionaries and 345 native helpers in India and 12 missionaries in Honduras.

The denomination supports three educational institutions: Eden Theological Seminary in Webster Groves, Mo.; Elmhurst College in Elmhurst, Ill.; and Oakwood Institute, Cincinnati, Ohio. It publishes also the following periodicals: the *Evangelical Herald*; the *Tidings*; the *Light Bearer*; and *Der Friedensbote*. The Rev. C. W. Locher, D.D., was president in 1932. Headquarters of the synodical administration and of the administrative boards are in the Evangelical Synod Building, 1720 Chouteau Avenue, St. Louis, Mo.

**EVERMANN, BARTON WARREN.** An American ichthyologist, died in Berkeley, Calif., Sept. 27, 1932. He was born in Monroe Co., Iowa, Oct. 24, 1853, and was graduated from Indiana University with the B.S. degree in 1886 and the Ph.D. degree in 1891. After serving for 10 years as teacher and superintendent of schools in Indiana and California, he was made in 1886 professor of biology at the Indiana State Normal School. Two years later he entered the service of the U. S. Bureau of Fisheries, becoming ichthyologist in 1891. During 1902-03 he was also chief of the division of statistics and methods of fisheries and during 1903-10 had charge of the division of scientific inquiry. From 1910 to 1914 he was chief of the Alaska Fisheries Service of the U. S. Bureau of Fisheries. He had previously served in 1892 as a United States fur-seal commissioner and had been made in 1908 chairman of the fur-seal board.

After 1914 he was director of the Museum of the California Academy of Sciences, and after 1921 director of the Steinhart Aquarium in San Francisco. He lectured at Stanford University during 1893-94, at Cornell during 1900-03, and at Yale during 1903-06. He was president of the Biological Society of Washington (1902-04), the Western Society of Naturalists (1915-17), the Pacific Fisheries Society (1917-19), and the Pacific division of the American Association for the Advancement of Science (1922), and at the time of his death was chairman of the committee on Conservation of the Marine Life of the Pacific. His works include: *Animal Analysis* (1886); *Report upon Ichthyological Investigations in Montana, Wyoming, and Texas* (1892); *Studies of the Pacific Coast Salmon* (1894-97); *The Fishes of Porto Rico* (1900); *Lopho, the Quail* (1902); *American Food and Game Fishes* (1902); *Nerka, the Blueback Salmon* (1902); *Modesty Itself, the Brown Towhee* (1903); *The Alaska Salmon Fisheries* (1903); *Fishes of the Philippines* (1906); *The Golden Trout of the Southern High Sierras* (1906); *The Fishes of Alaska* (1907); *The Fishes of Peru* (1915). In collaboration with S. E. Meek he wrote *A Revision of the Genus *Gerrus** (1886); with O. P. Jenkins, *The Fishes of the Bay of Guaymas, Mexico* (1891); with David Starr Jordan, *The Fishes of North and Middle America* (4 vols., 1896, 1900), and *The Aquatic Resources of the Hawaiian Islands* (1903); and with H. Walton Clark, *Lake Mawinkuckee, a Physical and Biological Survey* (1920).

**EXCISE TAX.** See TAXATION.

**EXHIBITIONS.** See ART EXHIBITIONS.

**EXPEDITIONS.** See ANTHROPOLOGY; ZOÖLOGY.

**EXPERIMENT STATIONS.** See AGRICULTURAL EXPERIMENT STATIONS.

**EXPLORATION.** Exploration and allied activities were carried on extensively during 1932, considering the unfavorable conditions resulting from the world depression. The Smithsonian Institution at Washington sent out or participated in 25 expeditions, which visited 13 States in America and several European countries, besides Canada, Alaska, Mexico, Haiti, Jamaica, British Guiana, and Southwest Africa. Other scientific institutions carried on their researches on a somewhat smaller scale. Expeditions to the Arctic and Antarctic regions are discussed under POLAR RESEARCH, while anthropological and archaeological investigations are described under their separate headings.

As in 1931, the unknown interior of the Arabian peninsula was again the scene of the outstanding exploration of 1932. The Englishman, H. St. John Philby, arrived in Mecca early in April after traversing a vast extent of the Ruba-el-Khali, or Great Southern Desert of Arabia, and rediscovering two sites of great historical interest. The Ruba-el-Khali was first crossed by Bertram Thomas in 1931 (see 1931 YEAR BOOK). Leaving Hofuf in Hasa, near the Persian Gulf, early in January, Mr. Philby reached the distant outpost of Jabrin on January 21. From there he struck southward into the desert in search of ancient and immensely deep wells at the oasis

of Magainma, which Major R. E. Cheesman, the first European to reach Jabrin, had heard of there in 1924. Philby found Magainma, where a well 171 feet deep provided excellent water. To some archaeologists, the name Magainma suggested an identification with the capital of an ancient kingdom called Magan, mentioned in Babylonian inscriptions.

Continuing southward across the Ruba-el-Khali, Mr. Philby discovered what he described as the long-sought site of the legendary city of Ubar (Wabar). It consisted of two meteorite craters. Turning westward, he reached the water-hole of Shanna touched by Thomas in 1931 and continued in a northwesterly direction through some 350 miles of waterless territory. On March 15, his caravan reached Sulaiyil, in the Wadi Dawasir, from where he proceeded to Mecca.

**NORTH AMERICA.** Notable progress was made in aerial survey work in various parts of the continent. The Maine coast was mapped for the U. S. Geological Survey by Capt. A. W. Stevens and Lieut. J. F. Phillips, U. S. Army Air Corps. Flying at 20,000 feet, with a five-lens camera capable of covering an area 20 miles wide by 75 miles long at each exposure, they surveyed an area of 3600 square miles in 15 hours. The U. S. Navy's third aerial survey expedition to Alaska mapped 4500 square miles of the Alaskan coast from Chignik Bay to Resurrection Bay. The Hydrographic Office of the Navy completed a 25-year survey of Cuban waters and published a new chart of the results. It also surveyed, by sea and air, some 1700 square miles of the coastal waters of Venezuela and Panama. See PHOTOGRAPHY.

Dr. John M. Cooper, anthropologist and ethnographer of the Catholic University of America, traveled during the summer by open boat from Moose Factory some 300 miles northward along the east coast of James Bay. Both peaks of Mount McKinley, Alaska, were climbed for the first time by one expedition on May 7 and May 9. The party consisted of Harry J. Liek, superintendent of Mount McKinley Park, Alfred D. Lindley, and two associates. On the descent from the second peak they found the body of Theodore Koven, who with Allen Carpe, was lost while conducting a cosmic ray expedition a short time before. An effort to map the glacial area between the Mount Fairweather, Alaska, range and the sea was made during the summer by a group of Harvard students led by H. B. Washburn, Jr.

**SOUTH AMERICA.** Exploration in South America during the year was featured by the extensive work of the German Andes Expedition. The expedition returned to Hamburg on December 6, after combining mountain climbing with the exploration and mapping of the high Andes and other scientific research. Members of the expedition climbed the peaks of Aconcagua (23,100 feet); Hualcan (about 20,000 feet), where Herr Hoerlin remained for eight days to measure cosmic rays; and Tchopikalki (about 21,650 feet). They discovered a path into the legendary Quitarosa Valley and in it many previously unknown Inca ruins.

A British expedition, headed by Robert Churchward, spent nearly four months in the Matto Grosso region in search of Col. P. H. Fawcett, who disappeared while exploring that region in 1925. They returned to Para, Brazil, in October without finding a clew to the whereabouts of the missing explorer. Ralph F. Donaldson and Stephan Rattin led two other parties in search of

Fawcett. The Brooklyn Museum Brazil Expedition, led by Desmond Holdridge, concluded 15 months of exploration and research in Northern Brazil. They explored the Marajo burial grounds in the delta of the Amazon and penetrated to the Sierra Parima Mountains. Their work served to corroborate Dr. Herbert Dickey's report that the source of the Orinoco River was some 50 miles southeast of this range. They found hundreds of square miles of virgin grass lands in the Amazon basin, capable of agricultural development. Commander G. M. Dyott, accompanied by Capt. E. Erskine, a retired British Army officer, and Walter Lewisohn of New York, surveyed the possibilities of colonization in the forest region of Ecuador.

Professor J. W. Gregory's geological reconnaissance of the main Andean range in Peru was ended by his death in the rapids of the Pongo de Mainique while descending the Urubamba River by canoe. Many of the specimens and other valuable material collected by his expedition was lost when his canoe capsized. The San Blas Indians of Panama, and natives of the interior of Ecuador and Brazil were studied by the Latin-American Expedition, Inc., of which Dr. Matthew W. Stirling, Chief of the Bureau of Ethnology, U. S. National Museum, was a member. Two scientists of the Carnegie Institution of Washington, Drs. Ralph W. Chaney and Erling Dorf, found in the highlands of Venezuela a temperate rain forest, similar to those which flourished in western North America in remote ages. Dr. Herbert S. Dickey was in the field with another party, but entered no unexplored territory.

**AFRICA.** The Belgian Scientific Mission to the Ruwenzori Mountains, Belgian Congo, headed by Comte Xavier de Hemricourt de Grunne, made a complete exploration of the zoological, botanical, and geological aspects of the western slopes of the range. They ascended Alexandra and Margherita peaks and finding that the summit of Mount Stanley was divided into three peaks, equidistant from one another, they named the highest peak (16,733 feet) Albert Peak in honor of their King. The party returned to Belgium by airplane in September. They announced November 21 that they had discovered gold and had brought back enough specimens to cover the cost of the expedition. The Umberto Peak in the Ruwenzori range (15,754 feet) was climbed for the first time since 1906 by Dr. Noel Humphreys, of Great Britain, and Harry Tunmer, a South African.

Major R. A. Bagnold again headed a motor expedition into the Southern Libyan Desert. Leaving Cairo September 27 with four cars, the expedition covered over 6000 miles, of which 2000 miles were through uninhabited territory. They touched the "Unknown Oasis" of Oweinat and continued west to Tekro in French Equatorial Africa, returning to Cairo at the end of November. They reported traces of paleolithic man in various parts of the desert. Two young Englishmen, William Donkin and Norman Pearn, crossed the Sahara by camel during the summer, covering the 1700 miles from Tuggurt in Algeria to Kano in French West Africa in four months. Taudeni, the slave-worked salt-mining centre of the Sahara, was visited for the first time by Europeans when two French Reserve Officers, Leo Gerville-Reache and J. Roger-Mathieu, made the dangerous trip across uncharted sands from Colomb Bechar, Morocco, by motor car. They

completed the round trip in ten days, as compared with the two months ordinarily required by caravan.

**ASIA.** On Feb. 12, 1932, the Citroen-Haardt Trans-Asiatic Expedition, begun in 1931, successfully reached Peiping after traveling in 315 days from the Mediterranean to the Yellow Sea. For further information of this expedition see under **GEOGRAPHIC SOCIETY, NATIONAL.**

A number of expeditions were in the Himalayas. A German-American expedition, headed by Wilhelm Merkl, of Munich, and including Rand Herron and Elizabeth Knowlton of New York and Boston, attacked the unclimbed peak of Nanga Parbat (26,630 feet) in the western Himalayas, but were forced to withdraw at the 23,000-foot level. They made two ascents of Chongra Peak (21,013 feet). A Britisher, Hugh Ruttledge, in May and June explored the col at the head of Sunderdhunga valley in an effort to find a shorter route to Nanda Devi Peak in the Garhwal Himalayas, which has repulsed nine separate assaults. Finding the Sunderdhunga col impassable, the party withdrew and ascended the Pindari valley from which they attempted to climb an unnamed peak 21,624 feet high. They were again forced to withdraw when within 3000 feet of the summit. A group of German and American scientists representing the Philadelphia Academy of Natural Sciences and led by Brooke Dolan, 2d, returned in June, 1932, from a year's work in Tibet and western China. They brought back many specimens of rare animals and birds and 28,000 feet of motion-picture film.

An unheralded feat was the ascension of Mount Minya Konka, a previously unscaled granite peak about 24,000 feet high in the western Chinese Provinces of Sikong, by three American youths, Richard Burdsall of Port Chester, N. Y.; Terris Moore, of Philadelphia; and Theodore Young, a Chinese born in Honolulu. The party, which also included Arthur Emmons of Dover, Mass., left Shanghai in July and spent several months in the Minya Konka country before making the climb in October and November. In his third expedition to the Karakoram mountains, P. C. Visser discovered new and gigantic glaciers. A Soviet expedition, headed by Nikolay Krylenko, conducted a geographical and geological exploration of the almost inaccessible Garmo Peak in the Eastern Pamir. They extended the map of the Eastern Pamir made by the German scientist Finsterwalder in 1928 and discovered a new pass uniting the valley of Garmo with the valley of the Vanch River.

At the end of the year, preparations were under way for a new British Everest expedition, the Tibetan government having given its permission. Hugh Ruttledge was named leader of the party of eleven. Besides this effort to scale the world's highest mountain on foot, preparations were under way to fly over the summit of Everest (29,141 feet) by airplane, with the Marquis of Clydesdale as chief pilot. **FALKLAND, fôk'lând, ISLANDS.** A British crown colony in the South Atlantic 300 miles

east of the Strait of Magellan, consisting of: East Falkland, 2580 square miles; West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia, about 1000 square miles, and other dependencies, including the South Shetlands, the South Orkneys, the Sandwich group, and Graham Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. Title to the Falkland Islands also is claimed by Argentina. Population (census of 1931) was 2392, exclusive of the whaling settlement of South Georgia which had 562 inhabitants including only one female. Stanley, the capital and chief city, had 1213 inhabitants in 1931.

Sheep raising, whaling, and seal hunting are the chief occupations. A total of 606,882 sheep were pastured on about 2,248,000 acres in 1930. In the same year 611,497 barrels of whale oil were exported and sealing operations yielded 12,962 barrels of oil. Exports in 1931 totaled £1,895,420; imports, £422,163; revenue, £120,530; expenditure, £103,805. There is no public debt. Governor in 1932, Sir James O'Grady.

**FAROE ISLANDS, fâr'ô; fâr'ô.** A group of 21 islands belonging to Denmark and lying midway between the Shetlands and Iceland. Area, 540 square miles; population in 1930, 24,200. The capital is Thorshavn, with 3200 inhabitants. Sheep farming and fishing are the main occupations. Administration is under a prefect named by the Danish King. There is a local parliament (Lagting) of 23 elected members, which elects one representative to the Danish Landsting (upper chamber). The people elect one deputy to the Danish Folketing (lower chamber). An autonomist movement has been gaining ground in recent years. The Faroe Lagting elected in 1927 included 10 autonomists, 10 unionists, 2 Social Democrats and 1 independent. Prefect in 1932, H. Ringberg. See **DENMARK.**

**FASCISM.** See **FINLAND, ITALY, GERMANY, AUSTRIA, HUNGARY, JAPAN under History**; **CELEBRATIONS.**

**FEDERAL CAPITAL TERRITORY, AUSTRALIAN.** An area of 940 square miles within the state of New South Wales, set aside in 1909 as the site of a Federal capital for the Australian Commonwealth. Estimated population on Mar. 31, 1932, was 9245 (exclusive of full-blood abo-

riginals), of whom about 7045 resided in Canberra, the seat of the Federal government since May 9, 1927. See AUSTRALIA.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1932 it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention; Free Baptists; Seventh-Day Baptists; Churches of God in North America (General Eldership); General Council of the Congregational and Christian Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; United Brethren in Christ; United Presbyterian Church of North America; United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council coöperates in certain specified areas of work.

The total number of local churches included in the constituency of the Federal Council, according to the *Yearbook of the Churches*, 1932, was 110,665. Clergymen numbered 134,246, while the total communicant membership (persons 13 years of age or over) was 21,059,315.

The council, made up of members designated by the several denominations to act for them, met for its quadrennial session in Indianapolis, Ind., Dec. 6-9, 1932. In accordance with the new plan of organization adopted at that session, the executive committee, of about 80 members, was to meet monthly, unless otherwise determined by its own vote, usually in New York City. It was to include two representatives officially appointed by each of the denominations, with an additional representative for every 500,000 of the communicant members after the first 500,000. It was to include also, as consultants, representatives of the coöperative agencies carrying on specialized work for the churches, among which are the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Student Volunteer Movement for Foreign Missions, and the International Council of Religious Education.

Under the new plan the work of the council, formerly entrusted to commissions, was organized into eight major departments, under the direction of the executive committee. The tasks of these departments may be summarized as follows:

The department of evangelism develops a united approach to the evangelistic work of the churches.

The department of social service is the centre through which the churches deal unitedly with social issues, giving particular attention to the developing of better relations in industry. It serves also as a connecting link between the

churches and the national social agencies, such as the American Red Cross, the child welfare organizations, and the U. S. Bureau of Public Health. During 1932 it carried on an educational campaign in the field of Christian family life, including a study of "mixed marriages."

The department of research and education issues a weekly information service bulletin, in which contemporary social questions are discussed from the standpoint of Christianity. In addition it makes special studies, the outstanding one in 1932 being an inquiry into the relation of church and state, including a consideration of the controversial question of church activities in the field of political problems.

The department of race relations furthers efforts of the churches in promoting coöperation and good will between the white and colored peoples in the United States.

The department of international justice and good will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation. During 1932 it devoted its attention especially to the development of a good will project between children of the United States and China, to the promotion of the reduction of armaments, to support of American membership in the Permanent Court of International Justice, and to a solution of the war debts problem.

The department of relations with churches abroad fosters coöperation between the religious bodies of the United States and those of other lands.

The radio department sponsors nationwide religious broadcasts, including three Sunday afternoon messages each week and a devotional service each week-day morning.

The field department establishes and strengthens the organized coöperation of churches in local communities.

The programme of the council is carried on in part with funds contributed by individuals interested in the work and in part by appropriations from the various denominations. The official organ is the *Federal Council Bulletin*, issued monthly and furnishing general religious news.

As a result of the reorganization plan adopted at the Indianapolis meeting the council was hereafter to meet biennially instead of quadrennially. The officers elected for 1933-34 were: President, the Rev. Albert W. Beaven, president of the Colgate-Rochester Divinity School, Rochester, N. Y.; and vice-president, the Rev. Lewis Seymour Mudge, stated clerk of the Presbyterian Church in the United States of America. They were also to serve as chairman and vice-chairman of the executive committee.

The council's national offices are at 105 East Twenty-second Street, New York City, the general secretary being the Rev. Samuel McCrea Cavert. Regional offices are maintained in the Woodward Building, Washington, and at 77 West Washington Street, Chicago. See PEACE.

**FEDERAL FARM BOARD.** See AGRICULTURE; UNITED STATES under Administration.

**FEDERAL INCOME TAX.** See TAXATION.

**FEDERAL POWER COMMISSION.** See WATER POWER.

**FEDERAL PRISONS.** See CRIME.

**FEDERAL RECEIPTS AND EXPENDITURES.** See PUBLIC FINANCE.

**FEDERAL RESERVE BANKS.** See BANKS AND BANKING.

**FEDERAL WATER POWER ACT.** See WATER POWER.

**FEDERATED MALAY STATES.** A group of Malay states under the protection of Great Britain, constituting a large part of the Malay Peninsula. They comprise:

State	Area sq miles	Population (1921)	Capital
Perak .....	7,875	599,055	Taiping
Selangor .....	3,195	401,009	Kuala Lumpur
Negri Sembilan ..	2,573	178,762	Seremban
Pahang .....	14,006	146,064	Pekan
Total .....	27,649	1,324,890	

The 1921 population included 510,821 Malays, 494,548 Chinese, 305,219 natives of India, 5686 Europeans, and 3204 Eurasians. The 1931 census population totaled 1,711,793. The principal cities are Kuala Lumpur with 111,738 inhabitants in 1931 and Ipoh, with 53,863. Port Swettenham is the principal port. In 1930, there was a total of 1475 schools, with an average attendance of 92,439.

**PRODUCTION.** Tin mining and the growing of rubber are the chief industries. The production of tin for the Federated Malay States in 1932, under the quota system, was limited to 38,904 metric tons, which was about 56 per cent of the 1929 (quota basis) production of 69,366 metric tons. On Jan. 1, 1932, there were 1188 tin mines in operation of which 784 employed less than 50 men and no machinery. In December, 1931, a tin duty of 5 cents per picul (133.3 pounds) was imposed on all shipments from the Federated Malay States to provide revenues for tin research. The leading agricultural products are rice, coconuts, rubber, sugar, tapioca, pepper, gambier (a wood extract used in tanning and dyeing), and nipa palms. The forests produce resins, canes, and gutta-percha. Gold and coal are mined extensively; lead, iron, copper, tungsten, manganese, silver, zinc, plumbago, mercury, and arsenic deposits have been found.

**COMMERCE AND FINANCE.** Excluding bullion and specie, imports in 1931 were valued at £12,390,142 (£19,602,382 in 1930) and exports (including reexports) at £14,604,001 (£24,926,067 in 1930). Revenue in 1931 amounted to 52,348,659 Straits dollars; expenditure, 62,163,328 Straits dollars. The public debt on Jan. 1, 1932, was 96,185,714 Straits dollars (80,185,714 in 1930). Ships numbering 13,021 with a total tonnage of 8,485,778, and exclusive of native craft, entered and cleared the ports of the Federated Malay States in 1930. The Straits dollar (par value, \$0.5678) exchanged at \$0.5244 in 1931.

**COMMUNICATIONS.** Railway mileage open for traffic in 1931 totaled 1089 miles. All railways are government owned or controlled. During 1932 a new \$8,000,000 railway terminal system was completed on Singapore Island. Roads surfaced with broken stone extended 2780 miles (1930) and there were 3052 miles of bridle roads and paths.

**GOVERNMENT.** The states are governed by the Federal Council in matters common to the four states. State councils legislate in individual state matters. The Federal Council consists of the Governor of the Straits Settlements (who is *ex officio* High Commissioner) as President, 13 government officials, and 12 unofficial members who are nominated by the High Commissioner with the approval of the King. There is a native ruler,

assisted by a British Resident, in each of the four states. High Commissioner in 1932, Sir Cecil Clementi. See BRITISH MALAYA.

**FEDERATION OF LABOR.** See LABOR, AMERICAN FEDERATION OF.

**FELLOWSHIPS.** See PAINTING; UNIVERSITIES AND COLLEGES.

**FENCING.** Joseph C. Levis, of the Boston Athletic Association, was the outstanding fencer in 1932, winning the national foils championship and then reaching the final strip in the foils competition in the Olympics at Los Angeles and by so doing helped the United States reach higher than ever before in Olympic competition. In the Olympics, Levis was beaten by Gustavo Marzi of Italy for the individual foils title. Previously he surprised everyone by defeating Lt. George C. Calnan, U.S.N., six times champion, for the national title. In the Olympics Calnan, who took the Olympian oath of amateurism for the entire band of athletes competing in the games, gained sixth place in the foils. Dr. John R. Huffman, of the New York Athletic Club, who retained his national sabre title, also placed sixth with his weapon. Leo Nunes, also of the New York Athletic Club, won the national épée championship, displacing Miguel A. deCapriles, professor of economics at New York University, who did not even reach the final strip. Another outstanding achievement for the United States in the Olympic games was the gaining of third place by the American foils team, of Calnan, Levis, Hugh Alessandrioni, and Dernel Every, behind France and Italy. To retain his national sabre crown Huffman defeated Norman Cuthbert Armitage.

The defeat of Miss Marion Lloyd at the hands of Miss Dorothy Locke was the feature of the national women's foils competition. Miss Lloyd, Miss Locke, and Miss Muriel Guggolz teamed to win the national women's team title for the Salle D'Armes Vince. Miss Guggolz won the national junior foils championship.

Yale gained most of the intercollegiate honors at the tournament held in New York City in April, winning the three-weapon championship, the épée team title, the individual foils and épée crowns. The members of the intercollegiate three-weapon championship team were Archibald Busby Jr., John Potter and Norman Bullard, foils; Joseph B. Ullman and Frank Walter, sabres; Rockwood Chin and George W. Thompson, épées. Chin and Thompson teamed to win the épée team title for Yale. Charles Murray, George Lathrop and John Honeycott made up the Army foils team, winner in that division, and sabre team honors went to the Naval Academy team of Andrew Adams Jr. and William Dimitrejevic. Potter was crowned individual foils champion, Chin épée champion and Maurice E. Kaiser, of the Navy, individual sabre champion.

The national three-weapon title went to the Fencers Club team of Alessandrioni, Tracy Jaeckel and Armitage. Huffman won the President's Three-Weapon tournament, practically a national championship. The Fencers Club captured both the national senior foils team and épée team honors. The team for the former was composed of Alessandrioni, Calnan and Every, and the épée team had Calnan, Jaeckel and Lt. Gustave Heiss as members. The sabre team honors went to the New York Athletic Club trio—Huffman, Nunes and Nicolas Muray. Ensign

John Howard of the Fencers Club captured the national junior foils crown; Lieutenant Heiss, the épée title; Lt. Fred R. Weber, the sabre title; and the University Fencers Club team of Jose R. D. de Capriles, Gilbert Weil and Albert di Giacinto, the junior foils champion team championship; the Fencers Club trio—Heiss, Jaeckel and Denholm D. McKie—the épée team laurels; and the New York Athletic Club team of Lorain Berz, Bernardo de la Guardia and Vito La Rocca, the junior sabre team honors.

**FENN, WILLIAM WALLACE.** An American theologian, died in Cambridge, Mass., Mar. 6, 1932. He was born in Boston Feb. 12, 1862, and was graduated from Harvard University in 1884, receiving the S.T.B. degree in 1887. Entering the ministry of the Unitarian church, he held pastorates in Pittsfield, Mass. (1887-91) and Chicago (1891-1901). He was also lecturer on Biblical literature at the Meadville Theological School (1892-1901, 1905-07) and preacher to Harvard (1896-98, 1902-05). After 1901 he was Bussey professor of systematic theology at the Harvard divinity school and was dean from 1906 to 1922. He was the author of *Lessons on Luke* (1890); *Lessons on Acts* (1894); *The Flowering of the Hebrew Religion* (1894); *Lessons on Psalms* (1900); *Theism and Immortality* (1921); and *The Christian Way of Life* (1924).

**FERRIÉ, GEN. GUSTAVE AUGUSTE.** A French military engineer, died in Paris, Feb. 16, 1932. He was born at Saint Michel-de-Maurienne, Nov. 19, 1868, and attended schools in Digne and Draguignan and the École Polytechnique in Paris. Entering the engineering corps of the French Army, he followed with interest Marconi's early experiments with wireless telegraphy, which he applied and developed during the next 40 years not only for military but non-military purposes in France and her colonies. Under his direction the Eiffel Tower was equipped as a wireless station, and he devised the system of time signals from that tower. Also, he was responsible for the establishment of the powerful stations at Lyons and Croix-d'Hins. He invented the electrolytic detector and various other devices, and was a pioneer in the theory of television and wireless photographic transmission. At the time of his death he was general inspector of the French military telegraph services and transmissions. He was president of the committee on longitudes of the International Astronomical Union and presided during 1921-29 over a series of international technical commissions at Paris, Washington, and elsewhere. He was also a member of the Academy of Sciences of the French Institute and an officer in various orders, including the Legion of Honor, British Order of St. Michael and St. George, Order of the Crown of Italy, Order of the Star of Rumania, Order of Leopold of Belgium, and Order of the Rising Sun of Japan.

**FERTILIZERS.** Due to the continued low purchasing power of agriculture, the total consumption of fertilizers for the year in the United States dropped considerably below the previous low consumption recorded for 1931. According to the Bureau of Foreign and Domestic Commerce the consumption of artificial fertilizers in Germany, considered to be the world's largest consumer market, declined 14 per cent in nitrogen, 18 per cent in phosphoric acid, and 23 per cent in potash during the nine months' period ended Mar. 31, 1932. Fertilizers suffered the most substantial decline of all groups of the chemical

industry in Germany, with a value loss of 32 per cent and a quantity decrease of 24 per cent. There was, in general, a further sharp decline in the world production of fertilizers over the previous year, due both to decreased consumption and increased international competition, which again was accompanied in most quarters by marked declines in wholesale prices, especially in the nitrogen and phosphate industries. The potash industry, particularly in Europe, was experiencing considerable difficulty in maintaining prices in the face of decreased exports and increasing reserve supplies. Importers of sodium nitrate to the United States announced a new schedule of prices for fall delivery representing a decrease of about 30 per cent. According to the National Fertilizer Association, the foreign market for ammonium sulphate almost vanished, whereas the imports to the United States from Germany, England, Poland, Belgium, Holland, and Japan more than quintupled for the year ended July, 1932, and the price dropped nearly 44 per cent.

Shipments of superphosphates to consumers and dealers in the United States for the first six months of 1932 were 40 per cent less than for the same months of 1931. Several of the principal fertilizer consuming nations, previously large importers of phosphates, became exporters and the United States exports of phosphate rock dropped to a low figure during the year ended July, 1932, according to the National Fertilizer Association. The production and consumption of superphosphate were very nearly balanced in Spain, according to the Bureau of Foreign and Domestic Commerce, and the efforts of the New Zealand government to aid primary production by granting a subsidy on the purchase of phosphatic fertilizers resulted in a satisfactory increase in the use of superphosphate at a reduced price to farmers.

Total sales of German potash for the first half of the year were only about 16 per cent under the corresponding period of 1931, and the turning point in sales for the better was reached in September, 1932. The production of superphosphates in France was badly affected by subnormal consumption and increased foreign competition, and prices in consequence were low. Sales of nitrogenous fertilizers were maintained but the output was curtailed and price drops prevented by the establishment of import licenses in both France and Japan. According to the National Fertilizer Association, the October tag sales of fertilizers in the 16 tag sale States of the United States showed an increase over the sales of October, 1931, indicating that a turning point for the better was reached.

Owing to the increasing acuteness of the competition in international trade in fertilizers and the necessity for retrenchment in many quarters, several of the larger chemical companies of the United States and of European countries were reorganized to consolidate the resources and activities of their existing subsidiaries and several of the fertilizer producing nations took governmental action to rehabilitate and protect their industries. The German government authorized the extension of credit guarantees aggregating 14,200,000 marks on purchases of fertilizers by farmers during the fall season. The Chilean government increased from 10 million pesos to 25 million pesos, the credit available to aid the independent sodium nitrate producers. The Polish

government set up a fund of about \$673,000 as a guarantee against losses on domestic sales of fertilizers up to 15 per cent of the credits extended. A tentative agreement for the control of nitrogen production, price, and allotment of export during the year July, 1932, to July, 1933, was reached by Chilean and European nitrate producers. Each country reserved its domestic market for itself and all exports from European countries were to be handled through a central office. The Polish government approved a five-year commercial agreement between German and Polish potash producers by which the Polish producers were to receive a quota of 4 per cent in the world market, which has been dominated by Franco-German interests. The National Technical Committee of the Italian fertilizer trade voted the formation of an association to organize and direct the movement of trade in fertilizer materials through dealers and to protect the interests of individual fertilizer merchants. An agreement was entered into by the Chilean and French governments under which 40 per cent of the amount due on whatever allotment is fixed for the importation of Chilean nitrate into France the coming year will be paid in pesos, thereby liquidating frozen commercial credit in Chile.

The development of better methods of fertilizer production continued, and the fertilizer industry was taking advantage of these developments, especially of new fertilizers, including the more concentrated materials. The research programme of the Bureau of Chemistry and Soils was concentrated largely on the development of promising new processes, the improvement of old methods, the production of new materials, the investigation of various raw materials, and the determination of the properties of new products suggested for fertilizer use. The position of the United States continued to improve with reference to its supply of raw materials, maintaining its independence in phosphate supplies and reaching a strong position in regard to nitrogen. Much was still to be desired in regard to potash.

In spite of the general world overproduction, European countries were continuing plans to increase their production of nitrogen, expansion being in progress especially in Latvia, Hungary, Bulgaria, and Greece. The Netherlands became a world factor in the ammonium sulphate industry and trade, occupying third place in the world trade. New plants for the manufacture of nitric acid, synthetic ammonia, employing the Montecatini process, and ammonia nitrate began operation in France, and the production of cyanamid was begun in a new plant in Italy. Norway continued to be an important producer and exporter of nitrogen and the first nitrogen fixation plant in the Southern Hemisphere was nearing completion in South Africa.

Progress continued in the development of synthetic fertilizers, especially in the United States, with reference to the fixation of atmospheric nitrogen and information continued to accumulate regarding the catalysts and catalytic reactions involved, thereby enabling the industry to choose catalytic materials for various industrial chemical processes more effectively. The work of the year supported the theory that the iron catalysts are particularly active in ammonia synthesis. The commercial utilization of gases in reactions at high pressures and temperatures, as in

the synthesis of ammonia, created a demand by the industry for more accurate physical data. During the year information accumulated on the solubility of nitrogen in water at wide temperature and pressure ranges which was of importance in the process used in gas purification. The Bureau of Chemistry and Soils also succeeded in calculating from compressibility data the heat capacities and the cooling by expansion of gases, thereby obviating direct measurements and making possible a very appreciable annual saving to the industry. Information continued to accumulate on the conditions favorable to urea synthesis from ammonia and carbon dioxide. It was demonstrated that the product, obtained either by employing double the amount of ammonia in the conversion or by adding ammonia after the conversion, may be utilized directly as a nitrogen constituent in preparing mixed fertilizers. This resulted in considerable economy in producing urea for fertilizer use and permitted the direct addition of larger amounts of nitrogen to mixed fertilizers, thereby producing a more concentrated material.

The supply of nitrogen produced by industrial processes continued to be but a small part of that constantly being fixed in the soil by natural agencies. The Bureau of Chemistry and Soils estimated that at least 2,500,000 tons of nitrogen are now fixed annually in the soils of the United States by organisms, which is worth \$350,000,000 annually. Marked progress was made during the year in determining the nature of the chemical reaction involved in the first step in the process of nitrogen fixation by bacteria. Humus also was found to stimulate the growth of nitrogen fixing bacteria, due primarily to its iron content. Agriculture continued to be the largest user of nitrogen and led also in the variety of forms used.

In spite of the natural potash resources and the progress made in their exploitation, the United States continued to be dependent largely on imports of potash. However, the status of domestic materials gave assurance that a shortage such as that of the war years would never occur again. The Federal five-year programme of potash exploration stimulated private exploration and actual exploitation of potash salts in the Permian Basin of New Mexico and Texas, and demonstrated the presence of great reserves of polyhalite and of at least one rich body of sylvite in the same general region. The production of potash from the waters of the Dead Sea in Palestine steadily increased, it being estimated that the output during the year would reach a total of from 3000 to 4000 tons. Russia made steady progress in the development and exploitation of the extensive potash deposits in the Ural district, especially in the vicinity of Solaminsk, and the production of potassium sulphate for the export trade was begun in a new plant in the province of Limbourg in Belgium. Progress continued in the development of acid extraction methods of recovering potash from minerals. Satisfactory extraction of Wyoming leucite was possible by treatment with cheap industrial nitric acid resulting in potassium and aluminum nitrates. A method of separating these products from impurities was developed resulting in potassium nitrate and high grade alumina. The practicability of a commercial method applicable likewise to Georgia shale also was demonstrated, and the nitration of

cement potash, a new product collected from cement kilns, was found to proceed with facility and yield a product containing 18 per cent potash and 9 per cent nitrogen. Information continued to accumulate on cheap and efficient blast furnace processes for the volatilization of potash from various minerals, especially leucite, alunite, and New Jersey greensands.

The production of superphosphate in the United States during the first half of 1932 was 44 per cent less than for the same period of 1931, and Italian production declined 37 per cent during the first quarter. The Netherlands became a leading world producer of superphosphate and began the manufacture of ammonium phosphate. Large fields of high grade lime phosphate were discovered in northeast Transvaal. However, efforts were continued in the United States to develop methods for more economically converting phosphate-bearing minerals into suitable available fertilizer materials with the conservation of important by-products. It appeared possible to eliminate artificial drying in the manufacture of triple superphosphate by treating the wet product of acid treatment of the raw rock with anhydrous ammonia. Such procedure resulted in superphosphates containing up to 30 per cent or more of available phosphoric acid and up to 10 per cent of ammonia. The furnace extraction methods used in potash manufacture again were applied successfully to the production of phosphoric acid with certain improvements, it being found that blast temperature is the determining factor in the cost of the process.

The Department of Agriculture and the State Agricultural experiment stations continued the experimental comparison on prominent soil types of new concentrated fertilizers with fertilizers of ordinary strength. The development of the mechanical placement of fertilizers also continued. Progress was made in unifying fertilizer control practices in the northeast and middle Atlantic States with special reference to the substitution of the term nitrogen for ammonia in guarantees, the use of even units, and adoption of the order nitrogen, phosphorus, potassium in fertilizer formulas.

**BIBLIOGRAPHY.** Sources of information regarding progress in the production and use of fertilizers are numerous. Current progress is recorded in *The Fertilizer Review* published by the National Fertilizer Association at Washington, D. C., and in *The American Fertilizer* published in Philadelphia, Pa. Statistics of the fertilizer trade and industry will be found in reports of the Bureau of Foreign and Domestic Commerce, especially in the weekly *Commerce Reports* and of the Census Bureau of the Department of Commerce. Other recent publications of interest are *Progress Report on Mechanical Application of Fertilizers to Cotton* in South Carolina, U. S. Department of Agriculture Circular No. 192, Washington, D. C., 1932; *Fertilizers for Cotton Soils*, U. S. Department of Agriculture, Miscellaneous Publication No. 126, Washington, D. C., 1932; *Conservation of Fertilizer Materials from Minor Sources*, U. S. Department of Agriculture, Miscellaneous Publication No. 136, Washington, D. C., 1932; *American Fertilizers*, by P. E. Howard, U. S. Department of Agriculture Miscellaneous Publication No. 143, Washington, D. C., 1932; *Chemical Encyclopedia* by C. T. Kingsett, New York, 1932; *Aéro Cyanamid*, American Cy-

anamid Company, New York, 1932; *Handbook of Fertilizers* by A. F. Gustafson, New York, 1932; *Fertilizer Suggestions for Idaho Farmers*, Idaho Agricultural College Extension Bulletin No. 88, Moscow, 1932; *Manures and Fertilizers—Their Nature, Functions and Application*, by F. T. Shutt, Canadian Department of Agriculture, Bulletin No. 145, Ottawa, 1932; *The Influence of Fertilizers on Crop Quality* by B. L. Hartwell, Washington, D. C.; *Fertilizer Materials and Mixed Fertilizers* by A. W. Blair, New Jersey Agricultural Experiment Station Bulletin 541, New Brunswick, 1932; the *Use of Fertilizers in Tropical and Subtropical Agriculture*, by A. Jacob, London, 1931; and *Die Analysenmethoden der Dungemittel* by A. Suchier, Berlin, 1931.

**FESSENDEN**, REGINALD AUBREY. An American electrical engineer and inventor, died in Flatts Village, Bermuda, July 22, 1932. He was born in Bolton, Quebec, Canada, Oct. 6, 1866, and attended Trinity College School, Port Hope, Ont. From 1887 to 1890 he was head chemist at the Edison laboratory in West Orange, N. J., where he conducted experiments to discover some substance which should have the properties of India rubber but be fireproof. He then became associated as chief electrician with the branch of the Westinghouse Electric & Manufacturing Co. in Newark, N. J. In 1892 he was appointed professor of physics and electrical engineering at Purdue University, and two years later was called to the Western University of Pennsylvania (later the University of Pittsburgh) as professor of electrical engineering. From 1900 to 1902 he was a special agent for the U. S. Weather Bureau, in charge of investigations in wireless telegraphy as an aid to the collection of daily weather reports. He then became general manager of the National Electric Signalling Co. of Washington, which had been organized to manufacture certain of his inventions, including a high-frequency alternator and high-frequency arc. After 1910 he was physicist and consulting engineer for the Submarine Signal Co. of New York City.

Radiotelephony was made possible by Fessenden's discovery of a system of modifying the frequency or intensity of continuous sound waves, his early experiments being carried out at Brant Rock, Mass., where on Dec. 23, 1900, he is credited with making the first actual transmission of human speech through the ether. The apparatus was gradually improved until by 1905 it was operated within a 25-mile radius of Brant Rock and by 1907 it was possible to talk with Washington, D. C., 400 miles distant. The principle as applied to radio-frequency amplification is known as the heterodyne effect. He also carried out at Brant Rock experiments with his wireless telegraph system which is today in successful operation on many steamship lines. In 1929 he received the *Scientific American* gold medal. Outstanding among his 300 inventions are a device for submarine telephony and telegraphy, which can also be used as a position finder and fog signal; iceberg detector; fathometer; compressed air condenser; wave meter; umbrella antenna; phantom antenna for wireless telegraphy; induction furnace; dirigible torpedoes; gun sights; subterranean water reservoir method of storing power; and low-pressure steam method of generating energy from solar and space radiation. He was a frequent contributor to scientific periodicals.

**FIELD ATHLETICS.** See ATHLETICS, TRACK AND FIELD.

**FIJI, fē'jē, ISLANDS.** A British Crown colony, comprising a group of about 250 islands (80 inhabited) in the South Pacific (15° to 20° S. latitude, and 177° E. to 178° W. longitude). The island of Rotuma (12° to 15° S. latitude, and 175° to 180° E. longitude) is included in the colony. Area, 7083 square miles; population on Jan. 1, 1932, was estimated at 185,573 including 93,414 Fijians; 76,772 Indians; 5058 Europeans; 1503 Chinese, and 8826 others. The capital Suva, on the south coast of Viti Levu, had 12,982 inhabitants in 1921.

Bananas, coconuts, maize, sugar cane, tobacco, rice, pineapples, cotton, and timber are the principal products. In 1931 imports were valued at \$929,514, and exports at £1,000,187; revenue amounted to £565,393 and expenditure to £605,973. The public debt on Jan. 1, 1932, was £936,608. Steamers entering the ports in 1930 numbered 182 of 744,807 tons.

Executive power is vested in a governor, assisted by an executive council and by a legislative council consisting of partly nominated and partly elected European, Indian, and native members. The Governor is also High Commissioner for the British islands of the western Pacific. Governor in 1932, Sir A. G. M. Fletcher (appointed 1929).

**FINANCE.** See PUBLIC FINANCE, and sections under *Finance* in Countries and States.

**FINANCIAL REVIEW.** Although the year 1931 had been, financially speaking, remarkable for its transformations and experiences, the 12 months of 1932 were, if anything, even more striking to the careful student of private finance. At the opening of the year the usual predictions on the part of "leaders" that there would be early recovery gave hope to some; but a more thoughtful consideration of the entire situation shortly showed that such forecasts could be true only in the event that certain well-defined policies on the part of the government and of the community were early placed in application. Further consideration of conditions soon afforded convincing proof that no such speedy action was to be had either from the government or from the financial public, owing to uncertainty and doubt how far it was safe to count upon definite prospects, or how far wise to apply well-defined remedies. What did become evident, before the first few months of the year in finance had passed, was that the country at large could not be expected again to become willing or active investors, without the laying of an entirely new and much sounder foundation for the reestablishment of confidence on the part of the rank and file of the community. During the year, the appearance of serious fears with regard to the soundness of the currency system—the President himself going so far as to assert that the country had been within 30 days of "going off the gold standard"—naturally increased the anxiety of the situation.

While the spectacular events of the preceding year involving as they had the financial collapse of Great Britain and Germany were not paralleled, the steady advance of currency difficulties, both in the Western nations and in the Orient, proved unmistakable and disturbing elements in the year's developments. More and more, during the year, nations tended to separate from one another; and, through moratoria, currency and exchange restrictions, banking interference or prohibitions upon the movement of funds, and in other ways, to break off definite financial relationships. The result was to drive international trade to lower and lower levels, to disturb exchange, to bring about abnormal movements of gold, and to curtail the balance or equilibrium of business which had been previously established. In consequence, security markets were disturbed and depressed as in no former time, and remittances and movements of moneyed capital became more troublesome to obtain and difficult to effect in practice. It was also true that the flotation of international issues and sales of securities became harder and harder to arrange, as the year advanced, and the tendency to hoard, at some times pronounced, became, if not more noticeable, more deeply-rooted. All these conditions tended to make the year one of extreme depression and disturbance in every branch of finance and investment. The shrinkage of business activity and extended failures, both of financial and business institutions, were among the most distressing factors of the period.

**STOCK EXCHANGE ACTIVITY.** Transactions on the New York Stock Exchange for the year 1932 totaled 425,234,294 shares as compared with 576,921,426 shares for the preceding year, and 810,626,276 for 1930. Total bond sales amounted to \$2,973,725,895 as against \$3,075,347,100 in 1931 and \$2,779,000,350 in 1930. The number of days when abnormal turnover occurred was small, and at no time was there the hysterical trading that had frequently characterized the market during recently-preceding periods. Nevertheless, during the summer months, several weeks of very active business passed and there were some 25 three million share days, with 12 when four million or over were sold and 3 on which over five million shares changed hands.

As for the two years preceding, a good deal of the business done, even on the more restricted basis that prevailed during much of the year, was for the purpose of realizing or liquidating the assets of banks and other sellers who were obliged to obtain cash. Accordingly, the New York Stock Exchange again passed through a period of lean earnings and seats, though not as low as in former months, sold at a bottom price of \$68,000 while closing the year at about \$115,000. The year's highest price was \$185,000. Consolidations and failures were again a characteristic feature of the time, and the retirements from the exchanges for one cause or another during the year were larger than usual, there being but 1171 offices left out of 1347 in force at the opening of the year.

Three general periods in the history of the year may be noted, the first extending from the beginning of January to about midyear, the second extending through the summer quarter, and the third during the fourth quarter. During the first half year, constituting the earliest of these periods, the trend of prices was quite consistently downward, with the result that the record

low prices of the year were reached in June. The influences preëminent during the first half-year were largely psychological—the depression due to the feeling that economic conditions were crumbling, the doubt and lack of confidence due to feeling that the banking situation was unsound, and that losses of gold would cause trouble, as well as other similar factors. No new industrial factors of highly significant nature had made their appearance. But the whole tendency was toward a sacrifice of securities, even at prices that in no respect corresponded to cost of production or to probable cost of reproduction of the plants and enterprises they represented.

given cause for attack. The movement was explained by its friends, therefore, on the ground that it was a forecast or anticipation of much improved business conditions, which (it was said) would shortly supervene. The date for such improvement was, as usual, set somewhat ahead, but it was asserted that it would probably make itself apparent, to some extent at least, during the autumn.

Autumn prices, however, showed no influence of the kind predicted. There was no addition to the volume of production in staple industries and, where such volume did show itself, it was merely of the "seasonal" scope that had been

<sup>a</sup> Gold released from earmark at Federal reserve banks less gold placed under earmark

<sup>b</sup> This figure, derived from preceding columns, represents the excess of domestic production over nonmonetary consumption of gold—chiefly consumption in the arts. In any given month, however, it may be predominantly affected by the fact that on the final day of the month (<sup>a</sup>) gold bullion or foreign gold coin recently imported may not yet have reached a reserve bank or the Treasury, and (<sup>b</sup>) gold bullion recently withdrawn from stock for export may not yet have been actually exported. The figures are subject to certain unavoidable inaccuracies in official reports of gold imports and exports

<sup>c</sup> \$15,649,000 of gold bullion imported on April 30 from France was not purchased by the New York Assay Office until May 1.

<sup>d</sup> Preliminary figures.

During the second period a new situation developed. The ending of the gold export episode due to the withdrawal of almost all foreign balances coincided with a favorable outcome at the Lausanne conference, where the European nations had succeeded in agreeing upon a general basis of understanding as to the terms of settlement of the prewar debts, and had thus opened the way to an apparent adjustment of the international debt question. At the same time, politicians, anxious to have the community hopeful in outlook, were exerting themselves to bring about an attitude of more courage, and were endeavoring, as far as possible, to have the market factors favorable to higher prices. Then also, the efforts of the Reconstruction Finance Corporation to sustain institutions that were encountering difficulty had about reached the peak of their prestige, and had not yet started on the down grade. Altogether, factors thus tended to bring about a rebound of values from the extremely low level to which they had fallen during the preceding months. Accordingly, the midsummer period enjoyed an unexpected advance in which stocks and bonds, in many cases, gained fully 50 per cent in value, and bade fair to attain a higher level of worth that would retain some elements of permanence. Apparently this movement was not based upon any tangible factors, so far as business or production were concerned, and accordingly had to suffer from the doubts raised by hostile critics, who saw in it the artificiality that had, in the past, so often

noted in former autumns. On the other hand, an unexpectedly large world outturn in cotton, wheat, and some other articles brought a sharp downward movement of commodity prices, which was reflected in the stock market as a depressant of security values. By midautumn, all securities had lost about one-half of the gain of the summer and stood at a point about midway between their June lows and the midsummer highs. For the remainder of the year, the trend was on the whole, downward, under the influence of indisposition on the part of the United States to make any adjustment for the immediate future, at least in the international debt relations whose adjustment was deemed a necessity for the working out of the Lausanne agreements. Security loans, which had risen during the summer, fell off again, and reached a new low point.

Advances of banks upon commercial paper steadily declined. Many new reductions or suspensions of dividends were announced. There was no realization, in any essential respect, of the hopeful forecasts that had been offered during the premature boom of the summer months.

STOCK EXCHANGE INVESTIGATION. One factor that unquestionably hurt the stock market, and indeed the entire securities situation, was the initiation and conduct by the Senate Banking and Currency Committee, of an inquiry into speculative methods and conditions, undertaken with the intent, originally, of meeting the wishes of the President, who had had the opinion that low prices on the New York Stock Exchange

were the result of the manipulations of short sellers. He had, at first, wished to have the inquiry limited to a study of short selling as such, but when this was brought to the attention of the Banking Committee, the undertaking was broadened into a study of market conditions in general. The outcome was a series of hearings lasting during the months of April, May, and June, and a continuance over the summer holiday season, with the intent of renewal later. While the committee did not reach the point of announcing its findings in any formal way, the hearings (which were public) brought up the details of various old scandals, and uncovered some that had been less widely known. The revelations concerned operations on the part of corporate executives and market operators which were in the nature of breaches of confidence, or questionable dealing, even when judged by the rather loose code of conduct prevalent in Wall Street.

tax-free; and in (as already stated) the issues, both short- and long-term, of the Federal government which were bought chiefly by banks as a means (they thought) of keeping "liquid," and retaining their funds in unquestionably salable form. A good deal was done in the way of necessary renewals and refundings, while some refinancing was effected with the aid of the Reconstruction Finance Corporation which induced holders of railway securities to renew or extend issues by giving aid, usually to the extent of one-half of amounts due while informing old holders that their only alternative would be a receivership, in which they would unquestionably suffer. These conditions gave to the whole new-issue state of things a sporadic character, and an uncertainty that was notable. The facts are reflected in the accompanying tabular view, which sets forth the main classifications of securities which were sold during the course of 1932.

SUMMARY OF NEW FINANCING

\* Includes issues of Federal land banks and Federal intermediate credit banks, not shown separately.

Sources.—For domestic issues: Commercial and Financial Chronicle; for foreign issues (issues publicly offered) annual totals are as finally reported by Department of Commerce, while monthly figures are as compiled currently and are subject to revision.

Suggestions, frequently made, that the net outcome might be the initiation of anti-stock exchange legislation of a drastic sort in Congress, although not substantiated in any positive or concrete fashion, were a disturbing element in the price situation.

NEW ISSUES. The new issue problem was naturally a difficult one in a situation which recognized only government securities as the type of credit, and was disinclined to give weight to any, save the most gilt-edged among former market favorites. Investors, generally speaking, were not disposed to subscribe for offerings, even of what would previously have been considered "high-grade" domestic securities,—save under pressure. The only exception was to be found in some very exceptional State and municipal issues, generally those which possessed the additional element of attraction that they were

MOVEMENT OF GOLD. The year 1932 was, beyond doubt, one of the most striking and disturbing periods, so far as concerned the movement of gold, that had been suffered by the gold using world-community. During the preceding year Great Britain had abandoned, for the time being at least, the gold standard, while France, alarmed by her own losses on balances carried in London banks, was doubly overcautious with reference to the safety of balances still held by her in foreign markets. Late in the year 1931, the French government, as it later was demonstrated, had reached the conclusion that the Bank of France should withdraw the balances held by that institution abroad, and Premier Laval had notified the Governor of the Federal Reserve Board to that effect during an official visit here in October, 1931. These withdrawals, already referred to in other connections, took

place during the first six months of 1932, and resulted in a movement out of the country amounting in all to about \$475,000,000 of gold. The conclusion of these shipments left the situation quieter for a time, but it was not long before the fact that the United States remained, of course, a creditor of the world, both on merchandise and on investment account, led to a renewal of the inward movement of former years. This inward movement was enlarged by special conditions growing out of the Japanese operations in China and Manchuria, accompanied by large purchases of war supplies, with payment made through specie shipments to the United States. The drift thus set up continued during the later autumn, and culminated in the requirement by the United States of resumption of payments on war debts owing to the close of the moratorium which had been declared by President Hoover in June, 1931. This resumption, and the difficulty of making settlement in any other fashion necessitated large shipments during December and the net outcome of the year's operations was to leave the country with

a large holding of gold on December 31, the total being about \$4,500,000,000. One effect of these shipments, and of other uncertainties in the holding of gold throughout the world generally, was seen in an unmistakable reduction of confidence in the gold standard itself, and a lessening of the disposition to reintroduce it which had pretty well established itself after the return of Great Britain to gold in 1925.

**INTERNATIONAL BALANCE.** Conditions tending to establish totally new relationships in the international trade position of the United States had become fairly well marked during the two years after the panic of 1929. They were, generally speaking, the rise of isolationist and nationalist philosophies in foreign countries, reflected in hostile tariff duties paralleling those of the United States, and in the gradual re-establishment of domestic industries in various foreign countries rendering it impossible to purchase as liberally of foreign products as had been the case during and after the World War. Along with these influences, went the tendency to refuse foreign financing in the financial markets

<sup>a</sup> For purpose of comparison with estimates of previous years the miscellaneous short-term credits are carried in this table as "adjustments for differences in year-end lags."

<sup>b</sup> Largely a deduction from American tourist expenditures.

<sup>c</sup> Issued outside our balance-of-payment area. Usually statistics of public offerings include those of all Territories and possessions, although Hawaii, Puerto Rico, and Alaska are parts of our customs area.

<sup>d</sup> Estimated net export of long-term private capital.

<sup>e</sup> The total of the first two columns of each year is the "international turnover."

<sup>f</sup> Preliminary discrepancy, due to net errors and omissions.

of the United States which still further curtailed foreign buying-power. The year 1932 did not reveal new phases of this general situation, but merely a continuous aggravation of those already developed. Spread of moratoria and suspensions of payment on bonds sometimes en-

curities. This, in turn, tended to restrict the foreign trade still further, and exports sank practically to low level.

The export and import operations of the United States, by months, are presented in the accompanying table.

MERCHANDISE EXPORTS AND IMPORTS

tirely, sometimes merely in gold, on the part of South American states, rendered the problem more and more difficult to deal with as the year proceeded, and tended to drive the exporting power of the United States to lower and lower levels. The nation, however, reduced its importations in much the same proportion as it did its shipments, so that at nearly all times there was a technically favorable balance, with a necessity on the part of foreign countries of liquidating some balance in this market in gold, or through borrowing, or by the sale of previously-held se-

FOREIGN EXCHANGE. Foreign exchange generally, during 1932, underwent a disorganization and disturbance that was almost unprecedented, with "pegging" and control of exchange on a scale that had not been known since the World War and that threw out of relationship to one another nearly all the major exchanges. Their artificiality and the application of "exchange control" in various important directions would alone have sufficed to render the quotations, even upon the chief markets, largely out of harmony with realities, and hence untrustworthy. Ac-

cordingly, trading in exchange assumed a more speculative character than had been true of it for a long time before.

Naturally, interest in the New York market centred around the movement of francs, marks, and pounds sterling, although at times large operations in Japanese yen were undertaken. The chief decisive factor affecting sterling was the operations of the Bank of England in its pursuit of the "managed money" theory, and the attempt to make the prices of sterling assume a level corresponding to what was believed to be the true interest of Great Britain in foreign trade. On the other hand, francs were affected largely by the artificial movements of gold and investments between the Paris and New York markets, and by the unsettled state of international relations regarding the prospective debt installments. Marks were, of course, the subject of constant regulation and oversight at the hands of the German Reichsbank throughout the period. The rates and quotations in other major exchanges were largely the result of direct control, or the indirect effects of control exerted upon those primary currencies that have already been referred to. Japanese yen depreciated pretty steadily throughout the year, and the question of definite devaluation was under discussion throughout the latter part of the time. Other oriental exchanges suffered, not only from the causes influencing the exchanges, as already set forth, but likewise from the fluctuations in the price of silver bullion which reached very low levels of value during the twelvemonth. In South American exchange, the various moratoria and systems of exchange control mentioned afforded the basis for serious disturbance of the entire structure of quotations, and there was little, if any, pretense of fixation of rates at any time on the basis of open market trading. The accompanying table reflects briefly the course of quotations of the principal exchanges during 1932. For values at par, see under COINS, VALUE OF FOREIGN.

COMMODITY PRICES. Although throughout the year 1932 there was constant expectation, and almost constant prediction of recovery in commodity values, only for brief periods during the summer was there any indication of such a movement. Transitory and unstable changes toward higher levels had no permanent effect upon the general average, although the latter had already been so much reduced during the preceding years as to render the average far less susceptible to influences tending to drive it downward. On the whole, weakness was still most manifest in staple commodity lines in which overproduction was still a controlling influence, while costs of living were considerably less variable than before, although still out of line with wholesale values and with general price averages. The average wholesale index stood, at the close of 1932, at 63, a practically low point for the movement but the range for the year was not more than approximately four points—a fact which strengthened many in the conviction that, in all probability, the downward movement had about reached its close,—though there were no conclusive indications of the time or extent of a probable movement of definite recovery. The net drop for the year was thus about 4 points as compared with 10 points the year previous, and 20 points since the panic of 1929. Middle West wheat price (No. 2 Red) stood at

the close of the year at 46 cents as against 74½ cents a year earlier and corn was 23¼ cents against 38 cents in 1931. Cotton was 6.10 cents as against 6.55 cents for middling upland at the close of 1931, while family beef closing at around \$12.50 showed a decline of near a third from the figure (\$17) which closed the year 1931. Pork which had been \$28.50 at the end of the year 1931 declined to \$15.50 at the end of 1932.

MONEY RATES. The policy of low interest and discount rates, which had been steadily adhered to by Federal Reserve banks during the years since the panic of 1929, was maintained, and the prevailing figure throughout 1932 was kept out of harmony with the true market or commercial rate, apparently in the belief that such low rates tend to support confidence or to bring back a prosperous condition. Rediscount rates were cut to 2½ per cent in New York on June 24. In making loans upon collateral the Reconstruction Finance Corporation early established a figure of 5½ per cent, while actual rates paid in private transactions during the year preceding were often very high and mortgage money, when obtainable, was often exorbitant in charge. The reserve banks during the year introduced one or two reductions closing the 12 months at 2½ per cent in New York and about 1 per cent higher at most of the interior banks. Acceptance rates as usual were materially lower, ranging about 1 per cent against 2 to 2½ per cent previously—a practically unprecedentedly low figure. Call rates in New York were, a great deal of the time, purely nominal with an actual charge at the close of the year of ½ per cent to 1 per cent. In most branches of the money market, it was true, as had been the case for two years, that the real problem of the time was that of negotiating the use of money on any terms. Business men continued to complain not of the rates they had to pay, but of the fact that (as they stated it) they were unable to get accommodation on any terms practically speaking.

Investment returns continued to vary with the utmost breadth. Many securities, as quoted, yielded on the price that had to be paid for them absurdly high figures, such as 8, 10, or 12 per cent, but it remained true that highest-grade bonds of all groups were very low in yield, the best standing at a decided premium even when their nominal coupon rate was not over 4 or 4½ per cent. On none of the various types of issues was the actual or realized rate indicative of anything in a commercial or financial way, inasmuch as the Treasury issues bore a wholly artificial return, while the rates realized by investors in corporate securities were rather estimates of possible risk of non-payment, or of receiverships, than they were of the true investment value of the issues so purchased. The investment market being completely disorganized and condemned to a strictly non-competitive condition, the figures of return and interest in the abstract were largely imaginary, and hence inapplicable to actual conditions.

**FINE ARTS.** See ART MUSEUMS; LITERATURE, ENGLISH AND AMERICAN; PAINTING; SCULPTURE.

**FINEGAN, THOMAS EDWARD.** An American educator, died in Rochester, N. Y., Nov. 25, 1932. He was born in West Fulton, N. Y., Sept. 28, 1866, and was graduated in 1889 from the State College for Teachers at Albany, N. Y., which in 1909 bestowed on him the Ph.D. degree. After

acting as principal of public schools in West Fulton and as school commissioner, Schoharie Co., N. Y., he became in 1892 supervisor of examinations and in 1904 (having been admitted to the New York bar in 1894) chief of the law division of the New York State Education Department. He was assistant commissioner for elementary education of New York during 1908-15 and deputy commissioner of education during 1915-19. He then accepted a call from the Pennsylvania Department of Public Instruction as State superintendent, reorganizing this department and the entire State school system during his four-year term. He was director of local school surveys in Buffalo (1917), Philadelphia (1922), Washington (1923), and Pittsburgh (1927). He was also a member of the National Educational Finance Inquiry during 1921-23, of the President's Advisory Committee on Education, to study the relation of public education to the government, during 1929-31, and of the National Committee on Education and Business in 1931. During 1927-28 he was education director of the Eastman Kodak Co., developing its experimental programme in classroom visual education through motion pictures, and was made president of the Eastman Teaching Films, Inc. He was prominent in the National Education Association, being president of the department of superintendence during 1917-18, a trustee during 1923-26, and chairman of the committee on legislation during 1930-31. After 1927 he was editor-in-chief of the *Winston Loomis Leaf Encyclopedia*. He was the author of *Text Book on New York School Law* (1907); *Judicial Decisions of the State Superintendent of Common Schools, State Superintendent of Public Instruction, and State Commissioner of Education, 1822-1913* (1914); *Teacher Training Agencies* (1914); *Documentary History of the Free School Movement in New York State* (1921); and *Documentary History of the Endeavor to Establish a Township School System in the State of New York* (1921).

**FINLAND.** An independent republic of Europe, bounded on the east by the Union of Soviet Socialist Republics, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, and on the south by the Gulf of Finland. Capital, Helsinki (Helsingfors).

**AREA AND POPULATION.** With a land area of 132,589 square miles (18,397 square miles of water), Finland had an estimated population on Dec. 31, 1930, of 3,658,125, compared with 3,364,807 on Dec. 31, 1920. The urban population in 1930 totaled 665,835, or 18.20 per cent of the total. Births in 1930 numbered 75,236; deaths, 48,240; marriages, 24,841. Emigration in 1931 was 1018 (3964 in 1930 and 6383 in 1929). The chief cities, with their populations at the beginning of 1931, are: Helsinki (Helsingfors), 241,115; Turku (Åbo), 60,234; Tampere (Tammerfors), 55,514; Viipuri (Viborg), 56,295. Of the 1920 population, 2,754,228 spoke Finnish and 340,963 Swedish. Both are official languages; Swedish names are given above in parentheses. Lutherans at the end of 1930 numbered 3,532,618.

**EDUCATION.** Illiterates comprised only 0.7 per cent of the population over 15 years of age in 1920. In 1930, there were 10,792 elementary schools of all classes, with 357,973 pupils; 279 secondary schools (including teachers' training schools), with 53,407 pupils; and 3 universities, with 6320 students (Finnish universities at

Helsinki and Turku and one Swedish at Turku).

**PRODUCTION.** The 1920 census showed 65 per cent of the population engaged in agriculture and 15 per cent in industry. In 1929, there were 285,448 farms, with 5,411,000 acres, covering only 6.5 per cent of the land area, while forests covered 57,100,000 acres, or 67.2 per cent. The forests, chiefly pine and spruce, are the chief source of industrial wealth; 40 per cent of the forest land is state owned. The chief industries, in order of value of production, are woodworking, paper, food and drink, machinery and shipbuilding, textiles, leather, clay and stone, light and power. Production of mechanical pulpwood in 1931 was 212,000 tons (194,000 in 1930); paper, 325,000 tons (319,000). As compared with 1930, the average export price of sawn timber and cellulose in 1931 fell 20 per cent, and for mechanical pulp, plywood and cardboard 15 per cent.

**COMMERCE.** According to preliminary figures, foreign trade declined sharply in 1931, but the favorable trade balance increased over 1930. Imports aggregated 3,457,640,000 Finnish marks (5,247,671,000 in 1930) and exports 4,455,447,000 marks (5,404,158,000 in 1930). The mark equals \$0.0252 at par and exchanged at \$0.0239 in 1931. The leading 1931 exports were: Pulp and paper, 1,830,309,335 marks (1,840,154,081 in 1930); timber, 1,771,950,683 marks (2,625,281,931); animal foods, 511,602,313 marks (517,628,520). Imports in order of value were textiles, metals, colonial produce and spices, cereals, machinery, minerals and earth, and spinning materials. Great Britain took 1,991,010,362 marks' worth of the 1931 exports, followed by the United States, Germany, and France. Germany supplied imports to the value of 1,207,402,676 marks, followed by Great Britain.

**FINANCE.** Closed accounts for 1930 showed revenue of 4,398,100,000 marks and expenditure of 4,738,700,000 marks. For 1931 budget estimates were: Revenue, 4,400,900,000 marks and expenditure, 4,412,300,000 marks; for 1932, 2,857,700,000 marks and 2,855,600,000 marks, respectively; for 1933, 2,877,362,000 marks and 2,877,336,000 marks, respectively. The 1931 accounts closed with a deficit estimated at 270,000,000 marks.

The public debt on Dec. 31, 1931, totaled 3,242,000,000 marks (foreign funded debt, 2,468,000,000; foreign floating debt, 349,000,000; internal funded loans, 360,000,000, internal short-term credits, 64,000,000).

**COMMUNICATIONS.** Finnish railways on Jan. 1, 1932, extended 3354 miles, all except 158 miles belonging to the state; highways (1930), 29,337 miles; navigable lakes and canals, 2500 miles. The state railways in 1930 carried 21,023,000 passengers and 9,574,000 tons of goods. The air line connecting Helsinki with Stockholm and Tallinn (Reval) carried 3838 passengers, 119,000 pounds of goods, and 60,000 pounds of mail in 1931. The merchant marine on Jan. 1, 1931, included 4802 vessels of 510,080 net registered tons. Entrances in the foreign trade in 1930 numbered 6774 vessels, of 4,421,935 tons; clearances, 6831 vessels, of 4,376,106 tons.

**GOVERNMENT.** Executive power is vested in a president elected for six years by 300 electors, who are chosen by direct election in the same manner as members of the Diet. Legislative power is exercised by the Diet (single chamber) in conjunction with the President. The latter governs through Ministers appointed by him, his decisions being taken in the Council of State of 10 Minis-

ters, who are responsible to the Diet. Members of the Diet are elected for three years by a direct vote of all citizens over the age of 24. The composition of the Diet following the elections of Oct. 1 and 2, 1930, was: Social-Democrats, 66; Agrarians, 59; Finnish Coalition party, 42; Swedish People's party, 21; Finnish Progressive party, 11; Small Farmers' party, 1. President in 1932, Dr. Pehr Evind Svinhufvud, elected Feb. 16, 1931. The cabinet formed Mar. 21, 1931, from a coalition of the bourgeois parties (Agrarians, Finnish Coalition, Finnish Progressive, and Swedish People's parties) was headed by Premier Juho Emil Sunila (Agrarian).

### HISTORY

**ABOLITION OF PROHIBITION.** Finland on Apr. 5, 1932, terminated its 13-year experiment with prohibition. Crowds, orderly but in a jovial mood, celebrated the day by filling the liquor shops opened, under strict government control, for the sale of strong drink. The overwhelming victory of the wets in the referendum of December, 1931 (see 1931 YEAR BOOK) was followed by the enactment of a new liquor law by Parliament on Jan. 30, 1932, which was signed by the President February 9. The measure provided for the supervision of the liquor traffic by a State Alcohol Corporation of ten members, appointed by the government. All liquor was purchased and sold through the Corporation, which was capitalized at 30,000,000 marks; all except two shares were owned by the government. Sales were permitted only on weekdays and it was stipulated that 35 per cent of the profits of the trade were to be spent for "temperance purposes." There was no limitation upon individual purchases.

Six months after the new law went into effect, an effort was made to assay its results. It was discovered that legal liquor sales had not eliminated the bootleggers, whose prices were lower than those of the State Alcohol Corporation. The government nevertheless hesitated to order a price reduction, for fear that consumption would increase. There was little or no increase of drunkenness as a result of the abandonment of prohibition, according to most observers, although this was attributed in part to the decline of purchasing power during the depression. There was much complaint at the strictness of the government's control and the high prices charged. Dispensaries were closed on Saturday, Sunday, and Monday as well as on days preceding and following all holidays. Moreover, the charge made for ordinary French wine was almost as high as that for good Scotch whisky, with the result that there was heavy consumption of strong liquors. Sales of beer were comparatively small; they brought in only about 5 per cent of the monopoly's income during the month of April. On September 23 Parliament passed a bill extending amnesty to some 20,000 persons convicted of minor prohibition offenses and they were immediately pardoned by the President.

**THE FASCIST REBELLION.** The increasing lawlessness of the anti-Communist Lapuan movement evidenced during 1931 culminated early in 1932 in a direct threat to the government. With Communism routed and suppressed, the Lapuans gradually expanded the original aims of their movement to include the eradication of Socialism and the revision of the Constitution along Fascist lines. A number of Socialist clubs and workingmen's halls were forcibly closed and

crimes against anti-Lapuans become increasingly numerous. The government, which had been placed in power chiefly through Lapuan support, was now forced to turn against them. On January 30, an order was issued to the provincial governors directing them to take energetic measures to repress lawlessness. The Lapuans replied by demanding the dismissal of Minister of Interior Baron E. von Born and Gen. B. Jalander, Governor of Uusimaa Province. When their demands were rejected they mustered about 4000 men at Mantsala, 40 miles from Helsinki, and threatened to march on the capital.

Supported by the army and the militia and by the bulk of public sentiment, the government took steps to meet the projected onslaught, but did nothing to precipitate a clash. By March 5, the Mantsala rebellion had collapsed without a struggle and the following day six of the ring-leaders were arrested. These included Gen. M. Wallenius, former Chief of the Army General Staff and the kidnaper of former President Stahlberg in 1930, and Vihtori Kosola, the chief Lapuan leader. The rank and file of the rebels were dispersed and in April the government prepared a bill extending general amnesty to all except some 100 military and civil leaders.

The Fascist movement was not suppressed, however. On June 14 a new revolt took place at Mantsala, where the demands of Lapuans for a Fascist government were coupled with requests for government aid for distressed farmers. Government troops were dispatched to the region and the excited peasants were again dispersed and their leaders arrested. On July 17, the Lapuans made an unsuccessful attempt to kidnap Minister of Defense Lahdensuo. Thereafter restlessness among the farmers declined, particularly after the government in September prepared a comprehensive plan of public relief, calling for the expenditure of 350,000,000 marks over the period of one year for public works and improvements. Chief among the public works projects announced was a modern arterial highway about 1050 miles long, connecting Helsinki with Abo, the chief port.

Trial of the leaders of Mantsala rebellion ended on November 21 with the sentencing of 52 defendants to penal servitude or imprisonment for terms ranging from two to 30 months. Some of the most prominent defendants, including Generals Wallenius and Kosola, received suspended sentences, being bound over for three years.

**SUNILA CABINET RESIGNS.** The Sunila ministry resigned on December 7, when President Svinhufvud refused to permit the Agrarian majority in the Cabinet to introduce in Parliament a bill fixing the legal rate of interest on private loans. The bill restricted interest on loans granted by others than banks or financial institutions to a maximum of 7 per cent for three years. It also forbade foreclosures of mortgages during the three-year period without special sanction. The bill was opposed by the other parties and by the officers of the State Bank, on the ground that it would upset the equilibrium of the money market.

**FOREIGN RELATIONS.** Relations between Finland and the Soviet Union, which became exceedingly strained in 1931, improved the following year. A treaty pledging both powers to non-aggression and the peaceful settlement of mutual disputes was signed at Helsinki on Jan. 21, 1932, and went into effect with the exchange of ratifications August 9. Toward the end of the year,

however, there was a revival of anti-Soviet feeling, attributed to the increased activity displayed by the Soviet secret service in Northern Europe. The Finnish police arrested about 100 Communists, many of whom were convicted of high treason.

Consult Malbone W. Graham, "Security in the Baltic States," *Foreign Policy Reports*, vol. vii, no. 25, Feb. 17, 1932, pp. 443-45.

**FIRE ASSURANCE, FIRE INSURANCE.**  
See INSURANCE; FIRE PROTECTION.

**FIRE PROTECTION.** For the first time since the establishment of municipal fire protection on its present basis, public fire department costs were very generally scrutinized during 1932, and reductions were made in many cities by decreasing the compensation of the men, decreasing the personnel or both. This movement has not progressed far enough to permit appraisal of its results, which must await further experience. The movement for reduction of fire department costs, along with other municipal expenditures operates in two ways, resulting in some cases in a reduction of fire protection facilities without regard to the needs of the community, and in other cases in intelligent consideration of the fire problem of the city as a whole, with resultant increased fire protection efficiency.

The 2 per cent decrease in the 1932 fire loss, as compared with 1931, indicates no significant change in the factors influencing the fire loss as discussed in the 1931 YEAR BOOK. Increasing seriousness of the incendiary fire problem has been offset by the decline in burnable values and the vigilance of fire protection authorities.

**THE 1932 U. S. FIRE LOSS.** The total estimated fire loss in the United States for the year 1932 was \$442,143,321. This amount is based on figures compiled by the National Board of Fire Underwriters.

The accompanying table gives the annual fire loss record by years since 1916:

1916 .....	\$ 258,377,952	1925 .....	\$ 559,418,184
1917 .....	289,535,050	1926 .....	561,980,751
1918 .....	353,878,876	1927 .....	472,933,969
1919 .....	320,540,399	1928 .....	464,607,102
1920 .....	447,866,677	1929 .....	459,445,778
1921 .....	495,406,012	1930 .....	501,980,624
1922 .....	506,541,001	1931 .....	464,633,265
1923 .....	535,372,782	1932 (Est.)	442,143,321
1924 .....	549,062,124		
		Total ..	\$7,670,871,768

#### COMPARATIVE MONTHLY LOSS ESTIMATES DURING 1930, 1931, AND 1932

Adjusted loss figures. \$449,739,132 \$464,633,265 .....

**LARGE LOSS FIRES, 1932.** During the year 1932 according to the National Fire Protection Asso-

ciation there were 44 fires involving an individual loss estimated at \$250,000 or over, an increase of one fire over the previous year. The geographical distribution of these fires shows a decrease of large loss fires in the South and Middle Western States, with a corresponding increase in the far West and along the Atlantic seaboard.

The chief factors that are indicated by the reports as being responsible for the large losses of 1932 are summarized in the table which follows. In most instances more than a single factor was involved.

	No. of fires
Inferior construction .....	17
Highly combustible contents or excessive amounts of burnable materials .....	13
Headway of fire when discovered .....	9
Lack of adequate public or private protection ...	9
Inadequate water supplies .....	9
Ineffective fire fighting .....	8
Failure of private fire protection ..	4
Fire department delayed in getting to work ..	2
Misuse of private mains .....	1

In 1931 the number of large loss fires was fairly equally divided between the various classes of occupancy. In 1932 the fires in miscellaneous occupancies exceeded those in mercantile establishments and industrial properties. The total estimated loss in these fires for 1932 was \$19,981,000, a decrease of \$5,407,000, or approximately 21 per cent from 1931.

Occupancy	No of fires	Estimated loss
Mercantile establishments	7	\$ 2,523,000
Wholesale (warehouses) 2	650,000	
Retail .....	5 1,873,000	
Industrial plants .....	9	2,473,000
Grain elevators .....	2	866,000
Grain elevator and packing plant .....	1	2,000,000
Miscellaneous occupancies ..	22	8,319,000
Piers and wharves ..	2 1,600,000	
College buildings ...	3 1,450,000	
Dwellings .....	2 875,000	
Churches .....	3 858,000	
Boatyard .....	1 838,000	
Resort hotels ...	2 500,000	
Amusement pier .....	1 400,000	
Power plant .....	1 400,000	
Dredge .....	1 400,000	
Apartment building ..	1 350,000	
River steamships ..	1 350,000	
Office building and church ..	1 300,000	
Institution (Soldiers' Home) ..	1 250,000	
Public building (City Hall) .....	1 250,000	
Railroad shop .....	1 250,000	
Conflagrations .....	3	3,800,000
Total .....	44	\$19,981,000

**PRIVATE FIRE PROTECTION.** While economic conditions precluded important extension of facilities during the year, private fire protection received a decided stimulus from several deci-

sions reducing the cost of water connections to automatic sprinkler systems. The majority of the larger cities have made no charge for such connections, on the ground that a building equipped with automatic sprinklers reduces the demand on the water system and on the fire department as compared with an unsprinklered building, and that the owner of such a building should not be forced to pay for his contribution to the public safety. The most important development in the field during the year was in San Francisco, where the previous annual charge of \$108 to \$288 for each connection was reduced by the Public Utilities Commission to \$36, representing merely a charge for inspection and maintenance.

**FISKE, CARL RUSSELL.** An American historian, died in Madison, Wis., July 10, 1932. He was born at Central Falls, R. I., Oct. 17, 1876, and was graduated from Brown University in 1897 and with the Ph.D. degree from Harvard in 1900. Called to the University of Wisconsin, he was advanced from instructor to professor of American history. He was also research associate for the Carnegie Institution of Washington (1908-09) and director of the British branch of the American University Union (1919). His works include: *The Civil Service and the Patronage* (1904); *Development of American Nationality* (1913); *American Diplomacy* (1915); *The Path of Empire* (1919); *Guide to the Study of American Diplomacy* (1919); *History of America* (1925); *Rise of the Common Man* (1928).

**FISHERIES.** See ALASKA.

**FISKE, MINNIE MADDERN.** An American actress, died in Hollis, Long Island, N. Y., Feb. 15, 1932. She was born in New Orleans, La., Dec. 19, 1865, the daughter of Thomas Davey, a prominent theatrical manager in the South, and of his wife, Elizabeth Maddern. Her stage career began at the age of three, when she appeared as the Duke of York in a performance of *Richard III* in Little Rock, Ark. Her first appearance on the New York stage was in 1870 as Little Fritz in *Fritz, Our German Cousin*. She subsequently played in *Chicago Before the Fire*, *Richelieu*, and *The Two Orphans*, and even occasionally took old women's parts such as that of the Widow Melnotee in *The Lady of Lyons*. Among the well-known actors with whom she appeared throughout her childhood were Laura Keane, Mrs. Scott-Siddons, John McCullough, J. K. Emmett, James Bennett, Barry Sullivan, and E. L. Davenport. Her education was interspersed between productions, being largely obtained in convents in Cincinnati and St. Louis. She made her appearance as a star in *Fogg's Ferry* at the age of 16, and during the next five years won a comparative degree of success as Mercy Baxter in *Caprice* and Alice Glendenning in *In Spite of All*. On her marriage to Harrison Grey Fiske, the playwright, in 1890, she retired from the stage for a few years.

On her return in 1894 Mrs. Fiske appeared as the heroine in *Hester Crewe*, written by her husband, and in the same year played the part of Nora in *A Doll's House*, the first of a long succession of Ibsen's plays with which she was identified. In 1897 she created a sensation in *Tess of the D'Urbervilles*, based on Hardy's novel. Afterward she appeared in *Divorçons*, *A Bit of Old Chelsea*, *Little Italy*, and *Becky Sharp*, the latter, a dramatization of Thackeray's *Vanity Fair* produced in 1899, being one of her greatest

character portrayals. In 1901 she appeared in *Miranda of the Balcony* and *The Unwelcome Mrs. Hatch* under the management of her husband, with whom she had opened an independent playhouse in New York, the Manhattan, in opposition to the American theatrical "trust." The following year she created a profound impression by her performance in *Mary of Magdala*, adapted from the German of Paul Heyse. She also produced and played in Ibsen's *Hedda Gabler* in 1903, in *Leah Kleschna* in 1904, and in *The New York Idea* in 1906. During 1907-10 she added to her fame as an Ibsen interpreter, appearing in *Rosmersholm* and *The Pillars of Society*. She also created two of her most successful rôles—Nell Sanders in *Salvation Nell* (1908) and Mrs. Bumpstead-Leigh in the play of that name (1910).

During the next decade and a half Mrs. Fiske appeared in *Lady Patricia* (1912); *The High Road* (1913); *Erstwhile Susan* (1916); *Madame Sand* (1917); *Service* (1918); *Mis' Nelly o' New Orleans* (1919); *Wake Up, Jonathan* (1921); *The Dice of the Gods* (1923); *Mary, Mary Quite Contrary* (1923); and *Helena's Boys* (1924), in all of which she displayed her talent as a comedienne of marked intelligence. She then returned to Ibsen and Shakespeare who had earlier called forth her powers of dramatic realism, appearing in *Ghosts* (1927); and *Merry Wives of Windsor* and *Much Ado about Nothing* (1928). Her last appearance in New York was in the comedy *Ladies of the Jury* in 1929. Previous to her death she was appearing on the road in *Against the Wind*. She was the author of several plays, *The Rose*, *A Light from St. Agnes*, *The Eyes of the Heart*, and *Not Guilty*, and collaborated with her husband in writing *Fontenelle*. Outside of her profession she devoted herself to the relief of suffering among children and animals.

**FISK UNIVERSITY.** A coeducational institution for colored people in Nashville, Tenn., founded in 1866. It consists of a liberal arts college, a music school, and a graduate department. The total enrollment of 411 for the autumn of 1932 included 166 men and 245 women. The faculty numbered 40, and there were 14 administrative officers and assistants. The productive endowment for 1931-32 was \$1,509,014 and the total income was \$325,275. The library contained approximately 42,000 volumes. Thomas Elsa Jones, Ph.D., was president; A. A. Taylor, A.M., dean; and Jesse F. Beals, treasurer.

**FIVE-DAY WEEK.** See LABOR; LABOR, AMERICAN FEDERATION OF; SOCIALISM.

**FIVE-POWER DECLARATION.** See MILITARY PROGRESS.

**FIVE-YEAR PLAN.** See UNION OF SOVIET SOCIALIST REPUBLICS.

**FLANDERS.** See BELGIUM under *History*.

**FLAX.** The flaxseed production in 1932 of 13 countries reporting to the International Institute of Agriculture, not including the Soviet Republics, one of the leading producing countries, was estimated at about 85,532,000 bushels. In most of the reporting countries the yields were below those of 1931 and also lower than the average annual production for the five years 1926-1930. Nearly all European countries reported a marked reduction in acreage. The production of India was estimated at 16,440,000 bushels and of Canada at 2,534,000 bushels. The European countries listed produced each less than a half million bushels. Argentina, the world's lead-

ing flaxseed producing country and reporting a yield of 85,461,000 bushels for the crop year 1931-1932, suffered a destruction of the 1932-1933 crop by locusts over an area of more than a million acres. In view of this loss coupled with a reduced sown area from 8,640,000 acres to 7,401,000 acres a harvest of 53,147,000 bushels was estimated. The Soviet Republics produced an average annual yield of 23,456,000 bushels on 4,528,000 acres but the total area sown for fibre and for seed in 1932 was reported as 7,347,000 acres.

The flaxseed production of the United States in 1932 as estimated by the Department of Agriculture was 11,841,000 bushels, grown on 2,087,000 acres at the rate of 5.7 bushels per acre. Due mainly to drought but also to some extent to grasshopper damage a large acreage in South Dakota, North Dakota, and Montana was a total loss. Minnesota stood first in yield with 6,027,000 bushels, and North Dakota second with 4,017,000 bushels. These two States produced over 80 per cent of the country's crop. During the fiscal year ended June 30, 1932, the imports of flaxseed were 13,850,000 bushels, of linseed oil cake 24,119,000 pounds, and of linseed oil 28,000 pounds. The flaxseed production of 1932 was less than half the domestic requirements. The exports during the fiscal period included 189,000 tons of linseed oil cake, 8000 tons of linseed oil cake meal, and 873,000 pounds of linseed oil.

According to estimates published by the International Institute of Agriculture the 1932 acreage of fibre flax in nearly all European countries excepting the Soviet Republics was below the acreage of 1931, and showed a marked reduction as compared with the average area for the five years 1926-1930. Among the leading producing countries Latvia reported a yield of 20,878,000 pounds and Belgium of 14,887,000 pounds of fibre. Lithuania estimated its production of flax and hemp fibre at 27,070,000 pounds. The Soviet Republics reported a yield of 1,202,626,000 pounds in 1931 and an average production of 740,958,000 pounds for the five years 1926-1930.

**FLEMING, WALTER LYNWOOD.** An American historian, died in Nashville, Tenn., Aug. 3, 1932. He was born in Brundidge, Ala., Apr. 8, 1874, and was graduated from the Alabama Polytechnic Institute in 1896 and with the Ph.D. degree from Columbia University in 1904. From 1903 to 1907 he was professor of history at West Virginia University, and from 1907 to 1917 at Louisiana State University. In the latter year he was called to a similar position at Vanderbilt University, where he was also dean of the college of arts and sciences and director of graduate work from 1923 to 1929. An authority on historical subjects pertaining to the South, he wrote *Reconstruction of the Seceded States* (1905); *The Civil War and Reconstruction in Alabama* (1905); *William Tecumseh Sherman as College President* (1912); *The Sequel of Appomattox* (1919); and *The Freedman's Savings Bank* (1927). He also edited Lester and Wilson's *History of the Ku Klux Klan* (1905); *Documentary History of the Reconstruction* (2 vols., 1906-07); and section six of the 12-volume *The South in the Building of the Nation*. He was one of the editors of the *Historians' History of the World* and, from 1914 to 1922, of the *Mississippi Valley Historical Review*.

#### FLOODS AND FLOOD PROTECTION.

Following an unusually long period of sub-normal precipitation over most of the United States east of the Rocky Mountains, precipitation became nearly normal in August, 1931; and in November, 1931, there was more than the usual precipitation through most of the Mississippi River system, amounting to as much as four times the normal over a large part of this area. In December, 1931, and January, 1932, precipitation was also above normal in most of the Mississippi valley, and much above normal during January in the Red and the Arkansas basins; in February, 1932, the amounts were above normal in portions of the Ohio basin, and in most of the Mississippi valley below Cairo. As a result, many of the rivers in the southeastern States, the Gulf States, and in the eastern and southern parts of the Mississippi system, rose rapidly in the late fall and early winter, and the interior rivers of Mississippi and Louisiana were in high flood for an unusually long time. A noteworthy feature of the floods was the short interval between the ending of the long-continued dry weather and the beginning of rapid rises in the streams of much of the country in the drought-stricken area. Floods in the lower Mississippi basin continued for five months.

Important floods occurred during March in North Carolina and Oregon; severe local floods took place in western Iowa in April. Noteworthy floods occurred in June in the North Canadian River of Oklahoma, and the Columbia River in Oregon and Washington. The former were caused by heavy rains, in which nearly eight inches of rainfall took place in nine hours over a belt 30 miles wide and 70 miles long; the latter were due to melting snow—the accumulated snowfall over the Columbia River drainage area was in many places the greatest in 10 years, but the snow melted so gradually that the flood crest in the lower Columbia was not much greater than the average annual spring crest. A local flood in July on the Paint and Armstrong creeks of West Virginia caused the loss of 18 lives, and \$2,500,000 damage. In August, rains of from 7 to 12 inches in the vicinity of Enid, Okla., and moderately heavy throughout the Cimarron basin, resulted in a flood in the Cimarron River in Oklahoma; over 150 square miles in the cultivated region were under water, and the erosion of the surface soil was a heavy loss to land fertility. This loss is difficult to estimate, and is not included in the table below.

The most noteworthy of all the floods of September and October were those in the lower Rio Grande valley: Torrential and probably unprecedented rains in Val Verde and adjacent counties in Texas during the last two days of August and the first day of September, and heavy to excessive rains over the Rio Grande and tributary watersheds below Del Rio later in September and early in October, caused destructive floods in the lower reaches of the Pecos and Devils rivers, and in the Rio Grande from Del Rio, Texas, to the Gulf of Mexico. The floods began early in September, and lasted well into October in the lower Rio Grande valley. Record-breaking crest stages occurred in practically all of the reach from Del Rio to Brownsville; the loss of property is conservatively estimated to have been more than \$2,500,000 on the American

side of the river, and in addition 10 or 12 lives were lost.

Later in the year the Reconstruction Finance Corporation authorized a loan of some 5½ million dollars to the Middle Rio Grande Flood Control District for flood and irrigation construction. This work has been noted in previous YEAR BOOKS.

While there have been important developments in the great Mississippi flood problem, the act passed by Congress in 1928, still needs clarifying before real progress on this huge project can be made. It will be remembered that the Louisiana courts granted an injunction in the so-called Kincaid case, which resulted in the cessation of all work on the Boeuf and Atchafalaya floodways. It was hoped that the U. S. Supreme Court would clear up this matter and state the objections of the Federal Government in reference to the payment of damages to owners of property within the proposed floodway areas. Unfortunately, the Court dismissed the Kincaid injunction on February 23, with the statement that "the defendant has a plain, adequate and complete remedy at law." In short, owners of such property can appeal to law when and if such damages occur and may or may not secure compensation. This, of course, leaves the matter still undecided and it is propable that Gen. Lytle Brown, Chief of Engineers, will be unwilling to go ahead with construction until the basic question of whether the government is or is not liable for such damages is settled. In the meantime, one of the floodways, the New Madrid-Birds Point, has been completed, although the so-called "fuse plug," or weakened levee construction which will deflect a flood into this channel, has not been constructed.

From the technical standpoint undoubtedly the most important recent development in the Mississippi programme has been the increase in attention given to possibilities of securing increased discharge, and correspondingly decreased flood heights, through channel-straightening operations.

Although the original Jadwin plan involved little change in channel lines some of the alternate schemes proposed contemplated very extensive straightening of existing channels. Tests of models in the Vicksburg laboratory indicate that greatly increased capacity may be secured in this way. Several sites have been selected for actual experiment and the construction of a cut-off across Diamond Point, below Vicksburg, has begun. It seems probable that the plans may be modified so as to include a considerable amount of such straightening, particularly below the Arkansas, if these experiments are confirmed.

Attention has been called under the article DAMS to the work of the Los Angeles Flood Con-

trol District in the San Gabriel Valley. This is a combined flood control and water conservation (for irrigation) programme.

Numerous, though relatively unimportant, floods were in progress at the close of 1932 in the South Atlantic and East Gulf States.

**FLORIDA. POPULATION.** According to the Fifteenth Census the population of the State on Apr. 1, 1930, was 1,488,211, as against 968,470 in 1920. Jacksonville had (1930) 129,549 inhabitants; Miami, 110,637; Tampa, 101,161; Tallahassee, the capital, 10,700.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops for 1932 and 1931:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges	1932	.....	14,300,000 <sup>a</sup>	\$23,595,000
	1931	.....	13,800,000 <sup>a</sup>	26,220,000
Grapefruit	1932	.....	9,200,000 <sup>a</sup>	10,580,000
	1931	.....	10,200,000 <sup>a</sup>	12,138,000
Corn	1932	687,000	5,840,000	2,453,000
	1931	674,000	5,729,000	2,979,000
Potatoes	1932	23,000	1,541,000	1,603,000
	1931	28,000	3,640,000	3,931,000
Sweet potatoes	1932	25,000	1,500,000	975,000
	1931	21,000	1,638,000	1,786,000
Cotton	1932	91,000	15,000 <sup>b</sup>	480,000
	1931	118,000	43,000 <sup>b</sup>	1,180,000
Peanuts	1932	273,000	113,295,000 <sup>c</sup>	1,699,000
	1931	271,000	157,180,000 <sup>c</sup>	3,772,000

<sup>a</sup> Boxes. <sup>b</sup> Bales. <sup>c</sup> Pounds.

**MINERAL PRODUCTION.** A decline in the production of phosphate rock in 1931 tended greatly to cut down the value of the State's mineral production for that year, since Florida normally produced more than four-fifths of the Union's domestic output of this material. The production of phosphate rock in the entire Union, 2,534,959 long tons, in value \$9,288,485 for 1931, was much less than that of Florida alone for 1930, which was 3,248,071 long tons, in value \$10,790,305. The State was a large producer of fuller's earth, of which its total was 80,619 short tons for 1930, in value \$1,251,653. Its stone quarries, serving chiefly local demand for the less expensive grades, produced 1,796,670 short tons in 1930 and 2,267,140 in 1929; by value, \$1,490,173 for 1930 and \$1,688,224 for 1929. The total value of the State's mineral products, after allowance for duplications, was \$15,484,206 for 1930; for 1929, \$14,803,606.

**FINANCE.** State expenditures in the year ended June 30, 1931, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$17,868,298 (of which \$4,477,165 was for local education); for interest on debt, \$180,198; for permanent improvements, \$9,800,397; total, \$27,848,893 (of which \$11,222,529 was for highways, \$2,266,812 being for maintenance and \$8,955,717 for construction). Interdepartmental payments were \$596,733 of total expenditure. Revenues were \$26,372,334. Of these, property and special taxes furnished 28.0 per cent; departmental earnings and compensation to the State for officers' services, 8.7; sale of licenses, 52.1 (in which was included a gasoline sale tax that produced \$8,307,711). Funded debt outstanding on June 30, 1931, totaled \$580,000, both gross and net of sinking-fund assets. On an assessed valuation of \$575,753,318 the State levied in the year ad valorem taxes of \$8,071,967. The State had also a contingent liability for \$11,722,686 of debt incurred under district assessment for drainage of the Everglades.

#### LOSSES BY FLOOD IN THE UNITED STATES DURING THE YEAR 1932

Drainage	Reported losses <sup>a</sup>	Lives
Atlantic	\$ 215,960	..
Gulf (except Mississippi River)	4,143,280	10
Mississippi (except Ohio River)	5,423,699	15
Ohio	2,788,256	21
Great Lakes	1,200	..
Pacific	224,250	..
Interior (i.e. Great Basin)	.....	..
Total	\$12,796,645	56

<sup>a</sup> Probably about 75 per cent of actual.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1932, was 5628.29. There had been during the year previous an addition of 42.60 new miles and an abandonment of 5.2.

**EDUCATION.** Progress was reported to have been made during the year in the preparation of a revised course of study in the public schools, of which the first draft was completed. During the academic year ended with June, 1932, school instruction was on the whole well maintained in the face of adverse times, but relatively little new school construction was carried on. There were enrolled in the public schools 367,758 pupils. Of these, 291,298 were in common schools or elementary grades; in high schools, 76,460. The year's expenditures for public-school education were: current, \$13,616,893; outlay, \$551,136; service of debt, \$8,057,034. The salaries of teachers averaged, by the year, \$861, as against a monthly \$113.80 reported the year before.

**CHARITIES AND CORRECTIONS.** Central authority over the State's institutions of care and custody, under the system in force in 1932, was exercised by a Board of Commissioners of State Institutions. This body was composed of seven ex-officio members: the Governor, as chairman, and the Attorney-General, Secretary of State, Comptroller, Treasurer, Superintendent of Public Instruction, and Commissioner of Agriculture. It had an executive secretary (J. P. Newell). The five institutions under the supervision of the board were: Florida State Hospital for the Insane, at Chattahoochee (population at the end of 1932, about 3754); Florida Industrial School for Boys, Marianna (about 400); Florida Industrial School for Girls, Ocala (about 91); Florida State Penitentiary, Raiford (about 1622, exclusive of some 1365 convicts in road camps); Florida Farm Colony for the Feeble-Minded and Epileptics, Gainesville (about 492).

**POLITICAL AND OTHER EVENTS.** The State Supreme Court delivered in May a decision relating to the bonds of Sanford, in which it held that liens for State, city, and county taxes ranked at parity with one another, but that liens for special assessments held inferior rank. The State obtained on September 1 from the Reconstruction Finance Corporation a loan of \$500,000 for public expenditure to relieve the needy unemployed. Rollins College dedicated on March 29 the new Knowles memorial chapel and the new Annie Russell theatre. The project to construct across the State, from coast to coast, with a proposed grant of Federal funds, a Gulf-Atlantic Ship Canal was promoted; Gen. Charles P. Summerall was chosen head of an association to further the project. White residents in the vicinity of Pahokee, opposed to the settlement of Filipinos in the neighborhood, drove out a colony of some 30 Filipinos on July 23. The death of Arthur Maillefert, allegedly under barbarous punishment at one of the State's convict camps, gave rise to an agitation against the management of such camps, and to the prosecution of two camp guards; one, G. W. Courson, found guilty of manslaughter, was sentenced, October 29, to 20 years of prison.

**ELECTIONS.** The State voted the Democratic National ticket on November 8 by about 3 to 1, the vote being: Roosevelt (Dem.), 206,307; Hoover (Rep.), 69,170. D. U. Fletcher was reelected to the United States Senate, and five Democrats (one at large) were elected to the House of Rep-

resentatives. Dave Scholtz, Democrat, was elected Governor.

**OFFICERS.** The chief officers of the State, serving in 1932, were: Governor, Doyle E. Carlton; Secretary of State, Robert A. Gray; Attorney-General, Cary D. Landis; Comptroller, Ernest Amos; State Treasurer, W. V. Knott; State Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

**Supreme Court:** Chief Justice, Rivers Buford; Associate Justices, W. H. Ellis, James B. Whitfield, Armstead Brown, Glenn Terrell, Fred H. Davis.

**FLORIDA, UNIVERSITY OF.** A State institution of higher education for men in Gainesville, Fla., founded in 1905. In the autumn of 1932 the registration totaled 2486, distributed as follows: Arts and Sciences, 579; commerce and journalism, 574; engineering, 379; education, 297; agriculture, 197; law, 206; graduate, 150; architecture, 61; and pharmacy, 52. The registration for the summer session of 1932 was 735 men and 964 women. The faculty numbered 52. The cost of operating and maintenance was \$2,330,276; the annual endowment was \$315,488. The library contained 90,000 volumes. President, John James Tigert, LL.D.

**FLORIDA STATE COLLEGE FOR WOMEN.** An institution for the higher education of women in Tallahassee, Fla., founded in 1905. The enrollment for the autumn of 1932 was 1746, distributed as follows: Graduate school, 17; college of arts and sciences, 688; school of education, 765; school of home economics, 197; school of music, 79. The enrollment for the summer session was 955. The faculty numbered 163 members. The income from endowment for the year was \$6150; State appropriations amounted to \$639,197. There were 46,238 volumes in the library. President, Edward Conradi, Ph.D.

**FLORE.** See **WHEAT**.

**FOG MENACE.** See **CHEMISTRY, INDUSTRIAL**.

**FOG SIGNALS.** See **LIGHTHOUSES**.

**FOLGER SHAKESPEARE MEMORIAL.** See **SCULPTURE**.

**FOLKLORE.** See **PHILOLOGY, MODERN**.

**FOOD AND NUTRITION.** **FOOD PRICES.** The index number for wholesale prices of foods reported by the Bureau of Labor Statistics, U. S. Department of Labor (*Mo. Labor Rev.*, vol. 35, no. 6, p. 1451), was 60.5 for October, 1932, as compared with 73.3 for October, 1931 (1926=100). Among the principal food groups dairy products showed the greatest decline, the index number falling from 86.1 to 60.5. The index number for meat products fell from 71.1 to 56.4, for cereal products from 70.0 to 64.1, for fruits and vegetables from 68.2 to 52.2, and for other foods from 69.7 to 65.4. The October, 1932, wholesale purchasing power of the 1926 dollar was \$1.53 for all goods, \$1.63 for milk and dairy products, \$1.56 for cereal products, \$1.916 for fruits and vegetables, \$1.773 for meats, and \$1.529 for other foods. *Bradstreet's* food index number based on the wholesale prices per pound of 31 articles of food was \$1.64 for the week ended December 27, as compared with \$1.95 for the week ended December 26, 1931.

The combined retail prices of 42 articles of food, as reported by the Bureau of Labor Statistics (*Mo. Labor Rev.*, vol. 35, no. 6, p. 1448),

were 15.7 per cent lower on Oct. 15, 1932, than on Oct. 15, 1931. The combined index number for all of the articles included was 100.4 as compared with 119.1 for the preceding year (1913=100). The index number for cereals had fallen from 129.8 to 119, for meats from 142.7 to 114.5, and for dairy products from 117 to 93.8. The downward trend, while less than that of 1931, carried the combined average retail prices to the lowest point reached since 1915, with prices from June through October at approximately the 1913 average upon which the index was based. There were wide variations, however, in the relative changes in different foods. A comparison of the October, 1932, prices of 23 individual foods with the 1913 prices of the same foods shows that 13 of these foods were still above the 1913 level. Conspicuous among these were certain meats (steaks, leg of lamb, ham) and tea. Although flour was lower than in 1913 bread was higher. Butter was considerably lower than in 1913, but milk was higher. All cities did not fare alike moreover in the decline of retail food prices. The relative changes in the weighted retail cost of food in 39 cities on Oct. 16, 1932, as compared with the 1913 average reveals that the combined values were at approximately the 1913 level, there were 16 cities in which retail food costs were higher than in 1913, the increases ranging from 1.2 per cent to 10 per cent. In the 23 cities in which the prices were lower than in 1913 the range was from 0.1 to 12.8 per cent. These comparisons are based on figures from the U. S. Bureau of Labor Statistics arranged by the U. S. Bureau of Home Economics.

**THE FARM FAMILY FOOD SITUATION IN 1932.** Since 1929 the spread between the retail prices of food purchased by farm families and the prices received at the farm for the sale of food products has been growing. From 1929 prices as 100, the index for food materials purchased by farmers declined 38.5 per cent in 1932 (average for first 10 months), while the index of prices received from the sale of grains declined 62, of meat animals 58, of fruits and vegetables 46, of dairy products 49, and of poultry products 55 per cent.

The spread between purchase and sale prices and the lack of ready cash have led to a great increase during the past two or three years in the production of food on the farm for home consumption. Preliminary figures from the Division of Crop and Livestock Estimates, U. S. Department of Agriculture, indicated that in 1931 about 12 per cent more wheat was ground at home or exchanged at mill for flour than in 1930, and about 16 per cent more potatoes, over 50 per cent more apples, about 9 per cent more eggs, and about 4 per cent more milk were kept for home consumption. The farm gardens were larger and more productive and farm slaughter of meat animals, especially pork, was greatly increased. Although corresponding figures for 1932 were not available at the time of writing, indications were that the production of these items for home use was even further emphasized. Larger gardens and increased home slaughter of beef, calves, and pork were particularly marked. Meat clubs were more numerous. An extensive canning and preserving programme was carried out and bread making, churning, cheese-making, and other home production activities were revived. In several States interest in the use of home ground corn and wheat was stimulated through the publication of extension bulletins giving di-

rections for the preparation and cooking of these farm products.

**EMERGENCY FOOD RELIEF.** The November, 1932, *Monthly Relief Bulletin* published by the U. S. Children's Bureau stated that reports from 168 agencies in 62 cities of 50,000 or more population showed a total of 944,009 meals provided for homeless and transient persons in September, 1932, as compared with 472,688 meals provided during the same interval in 1931. This is indicative of the situation throughout the country. In many instances the funds available for relief were insufficient to provide adequate diets at minimum cost. For this reason, the U. S. Children's Bureau and Bureau of Home Economics at the close of the year issued for the use of relief agencies revised food budgets in which weekly market orders for families of various sizes were included not only for adequate diets at minimum cost containing ample margins of safety in protective and other foods, but also restricted diets for emergency use containing only the "irreducible amounts" of protective and other foods below which no diet should ever fall. The latter diets were given only as a guide to food purchase when funds were insufficient to provide a fully adequate diet.

**PROGRESS IN NUTRITION. Infants.** Particular attention was given during the year to the deficiencies in both human and cow's milk. Further studies by Macy and her associates on the composition of human milk led to the conclusion (*Am. J. Physiol.*, vol. 100, p. 420) that breast milk produced under favorable conditions is comparatively low in its vitamin G as well as vitamin B content. Gunderson and Steenbock (*J. Nutrition*, vol. 5, p. 199) found it impossible to raise the vitamin B content of cow's milk and goat's milk above comparatively low levels by increasing the vitamin B content of the ration. Evaporated milk was found by Samuels and Koch (*J. Nutrition*, vol. 5, p. 307) to have lost from one-sixth to one-fifth of the vitamin B but none of the vitamin G of fresh milk, but the content of both vitamins was sufficiently low to warrant the conclusion that "undoubtedly it is wise to include other sources of these vitamins in all infant dietaries." The growing practice of giving vitamin B and G supplements such as Vitavose to both breast-fed and artificially-fed infants thus seems to be well-founded.

Vitamin D-enriched milk from cows fed irradiated yeast continued to receive attention in clinical reports, and two other processes for enriching milk in vitamin D for infant feeding came into prominence. In one of these milk is irradiated directly (*J. Biol. Chem.*, vol. 94, p. 749) and in the other is fortified by the addition of a cod-liver oil concentrate (*Science*, vol. 77, p. 19). Considerable interest in the various vitamin D-enriched milks from the standpoint both of infant feeding and of public health control was evident at the 1932 meeting of the American Public Health Association at which a symposium was held on milks of special antirachitic value (*Am. J. Pub. Health*, vol. 22, p. 1215).

Whatever may be the outcome as to the best method of providing infants and young children with vitamin D, it should not be forgotten that cod-liver oil is a valuable source of vitamin A as well as vitamin D and thus has much in its favor over any concentrate of vitamin D alone. Its importance in the diet of infants and young children was emphasized in the food budgets

noted above by the inclusion even in the restricted diets for emergency use of a weekly allowance of 2 or 3 oz. of cod-liver oil for each child under 2 years of age. Salmon oil may prove to be a less expensive oil for the purpose, for Eliot *et al.* (*J. Am. Med. Assoc'n*, vol. 99, p. 1075) found that an oil prepared from the waste products of salmon was nearly as rich as cod-liver oil in vitamin A and richer in vitamin D. Halibut oil, now on the market under the trade name Haliver oil, was found by Emmett *et al.* (*Ind. Eng. Chem.*, vol. 24, p. 1073) to be from 75 to 100 times as rich as cod-liver oil in vitamin A and considerably richer in vitamin D.

**Young Children.** Attention was called by Kugelmaas (*Arch. Pediatrics*, vol. 49, p. 713) to the fact that while infants have been so well supervised nutritionally in the past decade that the average growth curves of the past have been considerably outgrown, lack of supervision of the nutritional status of growing children and adolescents has been conducive of retrograde results in comparison with their nutritional course as infants. This has been recognized in recent attempts to establish better dietary standards for young children.

Quantitative data on food standards and food selection for pre-school children were reported by Sweeney and Chatfield (*U. S. Dept. Agr. Circ.* 203, p. 47) and by Rose *et al.* (*Child Development*, vol. 3, p. 29). The standards in the first publication were based on average values calculated from the daily food intake of children from 2 to 5 years of age at the Merrill-Palmer school in Detroit. For a 3-year-old child the standards adopted were protein 3.5, fat 4, and carbohydrate 12.4 gm., with a total of 99 calories per kilogram of body weight. For calcium and phosphorus the Sherman recommendations of 1 gm. each per day and for iron an allowance of 9 mg. per day or about 0.6 mg. per kilogram of body weight were adopted. In the second study similar data obtained in the nursery school of the Child Development Institute of Teachers College, Columbia University, New York City, were used to calculate the distribution of calories contributed to the dietary by six food groups. According to this classification the suggested distribution of calories for children of the nursery school age is foods from cereal grains 18-20, milk 45-55, fruits and vegetables 16-22, fats and oils 4-8, sugar 1-3, and eggs and meat from 3-5 per cent of total calories. This distribution represents a rather higher proportion of fruits and vegetables and lower of milk than the customary standards for children of this age.

**Adolescents.** The onset of puberty was found by Tupper and Mulier (*Am. J. Diseases Children*, vol. 43, p. 327) to be accompanied by marked but irregular increases in metabolism in both boys and girls, followed by a decrease after puberty was established. This was thought to make the adoption of normal standards for metabolism difficult for this age period. In a series of studies on the food requirements of adolescent girls, Wait and Roberts (*J. Am. Dietetic Assoc'n*, vol. 8, pp. 209, 323, 403) found that the energy intakes of healthy well-nourished school girls from 10 to 17 years of age varied greatly from a minimum of 1649 to a maximum of 2925 calories. The highest figures were for the 13-year-old group. When grouped by physiological ages the energy intake increased until after puberty and then decreased slightly. Great variations were found in

the intake of individuals from day to day, thus showing that a true picture of food intake, at least for this age period, cannot be obtained by a study of a single day, but requires at least four days and preferably a week or more. The protein intakes were found to vary directly with the energy intakes. The common practice of providing from 10 to 15 per cent of the calories in the form of protein was recommended for practical use, provided the calorie consumption is ample.

**Young People.** Studies by Hetler of the protein intake and basal metabolism of young women college students (*J. Nutrition*, vol. 5, p. 69) revealed a somewhat lower protein intake, 0.97 gm. per kilogram body weight, than previously reported by various investigators for men students. The average basal metabolism was 1260 calories per 24 hours, the values averaging over 7 per cent below the usual standards for this age group. An extensive investigation by Stark (*Wis. Acad. Sci., Arts, and Letters, Trans.*, vol. 27, p. 251) of the basal metabolism of young women students from 17 to 21 years of age led to the formulation of new standards for this age group considered to be more satisfactory than those now in use. Observations of food selection in the cafeteria service of one of the western agricultural colleges showed a tendency toward the selection of diets inadequate in calories and in essential food constituents even though proper food could have been selected at the same or lower cost. Analysis of the self-chosen diets of a number of young women students at another institution (*J. Nutrition*, vol. 5, p. 459) revealed marked inadequacies according to accepted standards. In a sorority house in which the diet was particularly deficient there were discovered in the course of a year one case of pellagra, two of tuberculosis, and a number of cases of marked undernutrition. These studies show that freedom of choice of foods by the college student does not always lead to the best diet, and suggest the need for greater supervision of the dietary habits of such student groups.

**Adults.** Rose and associates (*J. Am. Dietetic Assoc'n*, vol. 7, p. 369) have called attention to the lowered energy requirements of most adults "in this age of automobiles and other machines which relieve mankind of much physical labor." In their opinion this decrease in energy requirements necessitates giving increased attention to foods supplying liberal amounts of ash and vitamins without contributing greatly to total calories. As an illustration, commercial preparations of bran were mentioned as furnishing a definite quantity of vitamin B as well as fibre or roughage at a much lower caloric value than whole wheat bread of the same bran content. An exhaustive study by Cowgill and Anderson (*J. Am. Med. Assoc'n*, vol. 98, p. 1866) of the laxative effects of bran in healthy subjects led them to conclude not only that the effect was due to the fibre content of the bran, but also that there is a definite minimum roughage requirement for maintaining the body in a healthy condition, which can be expressed in terms of fibre. This requirement was given as from 90 to 100 mg. of fibre per kilogram of body weight per day, a requirement that can be met not only with bran but with fibre-containing foods such as certain fruits and vegetables.

Data reported by Benedict and Meyer (*Proc. Am. Phil. Soc.*, vol. 71, p. 143) on the basal meta-

bolism of 23 women from 66 to 86 years of age confirmed the general belief that metabolism decreases with age. In comparison with previously reported data for women under 50 years of age, it was evident that even at the same weight elderly women have a definitely lower metabolism per unit weight than do younger women. The basal metabolism figures of 10 women 78 years old or over was close to 1000 calories irrespective of their body weight and this figure was recommended as applicable, without too great error, to all women of this age group.

**DIETARY DEFICIENCY DISEASES.** The emphasis in dietary recommendations for all age groups on the so-called protective foods is the outcome of continued study of the effects upon nutritional status of deficiencies in the mineral and vitamin constituents of the diet. In addition to progress in knowledge of the effects of deficiencies of the various vitamins noted elsewhere (see VITAMINS), research was particularly active on the relation of diet to the nutrition of the teeth and to various anemias.

**Dental Nutrition.** The demonstration by Smith and her associates, noted in the 1931 YEAR BOOK, that mottled enamel is caused by excess fluorine in the drinking water of certain communities was confirmed by a survey of the entire State of Arizona with reference to the extent of mottled enamel and the fluorine content of the water (*Arizona Sta. Tech. Bul.* 43, p. 213). It was found that a concentration of fluorine of from 2 to 3 parts per million was on the borderline of safety and that larger amounts were always associated with mottled enamel in varying degrees. Inasmuch as at the present time the only method of eliminating this disfiguring tooth defect is a change in the water supplies of the affected communities, the problem has become a matter of public health control.

Many studies were reported during the year on the production of dental caries in rats and dogs by various dietary measures, but no satisfactory agreement was reached between the so-called nutritional and local environmental schools of thought concerning the cause and nature of dental caries. Enright and associates (*J. Dental Research*, vol. 12, p. 759), after clinical and laboratory studies covering many years, concluded that "(1) local environmental conditions are the main factors in the active causation of decay of fully erupted enamel and that (2) deficient diet and defective nutrition, by being responsible for the construction of teeth more susceptible to the action of the acids of fermentation, are the most important factors during the period of development of the teeth."

Klein and McCollum (*Science*, vol. 74, p. 662) advanced the opinion that maintaining the phosphorus content of the blood above a certain level is of primary importance in preventing tooth decay. Since this depends upon the level of phosphorus, calcium, and vitamin D in the diet, the theory fits in well with prevalent ideas that vitamin D plays a prominent part in dental nutrition. Mellanby and Pattison (*Brit. Med. Jour.*, no. 3715, p. 507) found that diets rich in vitamin D and containing no cereals checked the spread of dental caries in a group of children better than one correspondingly rich in vitamin D but containing cereals. In Mellanby's opinion (*Brit. Med. Jour.*, no. 3746, p. 749) vitamin D is essential both for the calcification of the teeth and their later resistance to disease, but in addi-

tion cereals contain something, which she calls a toxamine, which counteracts the effects of vitamin D and calcium. In extensive feeding tests on children in three orphanages near New York City, McBeath (*J. Dental Research*, vol. 12, p. 723) was able to reduce the incidence of caries among the children by supplementing the institution diet with various protective foods, and concluded that vitamin D was of importance in that it was the dietary factor most deficient in the institution diet and most markedly increased in the experimental diet. A review in *Nature* (vol. 129, p. 926) of recent literature on dental caries summarizes the present status of the problem thus:

Immunity to caries depends on the teeth being properly calcified and the mouth being immune to the growth of the acid-forming bacillus. Prevention of caries in a susceptible mouth depends on oral hygiene and especially on the regulation of the diet, with the view of increasing the resistance of the teeth. Cereals should be avoided, and a plentiful supply of vitamin D (or vitamins A and D) provided, and the diet should contain an abundance of milk, eggs, potatoes, fish, meat, green vegetables, and fruits.

**Anemias.** With the general acceptance of the theory that copper is essential to iron for hemoglobin formation and thus for the prevention and cure of the so-called nutritional anemias, interest was centred theoretically in the mechanism of the action and practically in the relative anti-anæmic potency of different foods in terms of their iron and copper content. Evidence was reported during the year from several laboratories leading to the conclusion that copper functions through mobilizing the iron reserves in the body. Josephs (*Bul. Johns Hopkins Hosp.*, vol. 49, p. 246) compared the action of iron alone and with copper on a series of anæmic infants and found that up to a certain level of hemoglobin iron treatment alone was effective, but beyond that copper was necessary. Continuing his studies with rats, Josephs (*J. Biol. Chem.*, vol. 96, p. 559) found that copper did not increase the total iron content of the bodies of rats, but only the proportion of iron in hemoglobin as compared with the tissues. Elvehjem and Sherman (*J. Biol. Chem.*, vol. 98, p. 309), following a similar plan except that the liver and spleen were analyzed for iron rather than the whole body, found that when iron alone was fed there was an increase in the iron content of the liver and a very slight increase in the spleen. When iron and copper were fed together or copper alone after a period of iron feeding, the iron content of the liver decreased and the amount of hemoglobin in the blood increased. Of great interest in this connection is the report of Sheldon (*Brit. Med. Jour.*, no. 3749, p. 869) of analyses of the iron and copper content of human livers, including fetuses. He found a gradually increasing storage of both iron and copper in the fetus until birth, after which the values dropped steadily until the age of 12 to 18 months, showing a mobilization of the reserves to compensate for the low value of iron and copper in milk and the necessity for making special provision for these elements after the reserves have been exhausted. Sheldon suggested that since the reserve stores of iron and copper are acquired from the mother, the incidence of anæmia in infants might be lessened by providing more ample supplies of these elements in the diet during pregnancy. A comparison by Coons (*J. Biol. Chem.*, vol. 97, p. 215) of iron retention of a group of women during preg-

nancy with their food consumption led her to conclude that under fairly ideal conditions it is possible for the mother to assimilate during pregnancy enough iron from the food to supply the newborn infant with the needed reserves.

Among the studies reported during the year on the anemia-preventing properties of various foods in relation to their iron and copper content were those of Coulson *et al.* (*Am. J. Pub. Health*, vol. 22, p. 1141) on oysters from all the important producing areas on the Atlantic and Gulf Coasts; Levine *et al.* (*J. Nutrition*, vol. 5, p. 295) on various South Carolina grown vegetables; Rose and Vahlteich on cereal products and liver (*J. Biol. Chem.*, vol. 96, p. 593), and Adolph and Kao (*Chim. J. Physiol.*, vol. 6, p. 257) on soy-bean products. These indicate that with proper attention to food selection it should not be necessary to resort to iron and copper therapy to maintain proper hemoglobin content in the blood. As emphasized editorially in the *Journal of the American Medical Association* (vol. 99, p. 2114) "enthusiasm for the new discoveries must not be permitted to open the door to unfounded therapy."

The important announcement by Castle *et al.* (*J. Am. Med. Assoc'n*, vol. 97, p. 904) of the hypothesis that pernicious anemia is a deficiency disease depending upon the absence in the gastric juice of an "intrinsic" factor which in the normal body combines with an "extrinsic" factor (probably vitamin B<sub>12</sub>) to maintain normal bone marrow activity, was followed by further clinical evidence reported by Strauss and Castle (*Lancet*, 1932, ii, p. 111) that other related anemias such as the macrocytic anemia of the tropics, of sprue, and of celiac disease are due in common to lack of one or the other of these factors. They suggested the possibility of preparing a simple and inexpensive product for the treatment of pernicious anemia by combining hog stomach mucosa with yeast concentrates.

More recently, Morriss, Schiff, *et al.* (*J. Am. Med. Assoc'n*, vol. 98, p. 1080) reported the concentration from normal gastric juice by vacuum distillation of a substance which they considered to be the intrinsic factor of Castle and his associates, a hormone for which they proposed the name "addisin" after Thomas Addison who first described pernicious anemia. Later they announced (*Brit. Med. Jour.*, no. 3753, p. 1050) that the same hormone had been found in the gastric juice of swine, dogs, and cattle and thus is presumably a constituent of the normal gastric juice of all species. Remarkable results were reported in preliminary tests with the use of the active substance obtained from the gastric juice of swine in the treatment of pernicious anemia. The possible adoption of this method of treatment would not remove pernicious anemia entirely from the group of dietary deficiency diseases, for if the theory of Castle *et al.* holds, it will still be necessary to provide an abundance of the extrinsic factor in the form of sources of vitamin B<sub>12</sub>. See also VITAMINS.

**FOOTBALL.** Teams conspicuous for their excellence were plentiful during the 1932 football season, but, as in 1931, the University of Southern California eleven, fashioned by coach Howard Jones, who had almost completely usurped Knute Rockne's place as guiding genius of the game, was superb and stood out a speck above the others. True, the conscientious historian was troubled because the Trojans of Los Angeles did play only one team from outside its sector, but the general high calibre of the Pacific Coast teams, and the manner in which Southern California wreaked havoc there, made it the logical choice for mythical national honors. Southern California downed all early season opponents with ease and then trounced Notre Dame's fine team, 13-0, in December. The Trojans started the year by downing Tulane, New Year's Day in the Rose Bowl, clearly earning the 1931 championship. As 1932 ended they were preparing to meet Pittsburgh, selection from the East, in the Rose Bowl, New Year's Day, 1933.

Pittsburgh's selection as Rose Bowl representative of the rest of the country excited comment. Pittsburgh had a fine team, had trimmed Army and Notre Dame, but had been held to scoreless ties by Nebraska and Ohio State, and many experts held that Colgate should have been invited. Colgate, coached by Andy Kerr, had gone through the season undefeated, untied, and unscored upon, a feat not accomplished by an eleven of major importance since Yale achieved the goal back in the 1880's. Colgate defeated New York University, 14-0, and Brown, 21-0, among others in its march of triumph. Columbia, Fordham, Army, Penn were the other strong teams in the East, with Fordham alleviating the superiority of the Pacific Coast by vanquishing St. Mary's and Oregon State in intersectional battles.

Michigan, winner of the Big Ten Conference title, went through undefeated and earned recognition as one of the most powerful teams in the country. The Wolverines defeated Princeton and Minnesota among other strong teams. The slim margin over Minnesota, 3-0, was practically due to the terrific storm raging over the gridirons of the country that day. Tennessee continued its glorious trail in the South and finished unbeaten with only a tie by Vanderbilt to mar the record. Because of the 20-20 Auburn-South Carolina tie in the final game of the season Tennessee was awarded even ranking with Auburn for Southern honors, with many experts giving the palm to the Volunteers. Auburn, with Jimmy Hitchcock showing the way, was one of the big surprises of the season. The Auburn team was strong, alert, and clever. Louisiana State, coached by Biff Jones, former Army tutor, was another of the strong Southern elevens. Texas Christian carried off the title in the Southwest Conference and Utah won the Rocky Mountain crown for the fifth year in a row. Nebraska was again supreme in Big Six ranks and Oklahoma

A. and M. stood out in the Missouri Valley Conference.

All over the country the somewhat drastic changes in the football rules which were in effect for the first time in 1932 met with mild approval. There was some grumbling at the outset but the malcontents subsided when it became apparent that the changes would make no real difference in play. The new rules had been put in operation early in the year after the rules committee, under the chairmanship of Edward K. Hall, who died in November, had made the changes in an effort to tone down the game and lessen the chance of danger. (Two major college players and forty other lesser known men had died as the result of football injuries in 1931.) The rule that stirred the most comment was that which rendered the ball dead when any part of the carrier's body except his hands or feet touched the ground. The new kickoff rule provided that five men of the receiving side must remain between their restraining line and the next five-yard mark until the ball is kicked. This curbed the wedge play effectively and there were practically no injuries on kickoffs during the college season. In fact, injuries were greatly reduced because of the new rule.

In professional football, the year saw the end of the three-year reign of the Green Bay (Wisconsin) Packers in the National League. The Chicago Bears won the title by defeating the Portsmouth Spartans in the playoff, indoors in Chicago, 9-0. Red Grange, former sensational Illinois University halfback, made the touchdown that gave the Bears the championship.

The end of the season marked the end of the reigns of several of the leading coaches of the country. Mal Stevens, who had coached Yale for four years, resigned in December and Reggie Root, former Yale lacrosse player, University of Mexico coach, and freshman coach at Yale in 1932, was appointed as Stevens' successor. Glenn Scobie (Pop) Warner, one of the bigger figures in the football coaching profession, then resigned at Stanford University and was immediately signed to coach at Temple University, Philadelphia. Major Frank W. Cavanaugh, grizzled coach at Fordham University, retired at the end of the season.

The scores of some important games follow:

Southern California, 13—Notre Dame, 0; Yale, 19—Harvard, 0; Army, 46—Harvard, 0; Fordham, 7—New York University, 0; Pittsburgh, 7—Stanford, 0; Yale, 7—Princeton, 7; Colgate, 21—Brown, 0; Auburn, 20—South Carolina, 20; Notre Dame, 20—Army, 0; Brown, 7—Columbia, 0; Michigan, 3—Minnesota, 0; Columbia, 7—Navy, 6; Army, 19—Navy, 0; Pittsburgh, 12—Notre Dame, 0; Pittsburgh, 18—Army, 15; Oregon, 12—Louisiana State, 0; California, 27—Georgia Tech, 6.

**FORAGE CROPS.** See ALFALFA; HAY, ETC.

**FORDHAM UNIVERSITY.** A Roman Catholic institution for higher education, under the Society of Jesus at Fordham, New York City, founded as St. John's College in 1841. It is the largest Roman Catholic educational institution in the United States. The enrollment for 1932-33 totaled 8078 students, including 1512 in the teachers' college and 715 in the graduate school, and a distribution among the other colleges as follows: Law, 1089; Fordham College, 1437; downtown college, 718; business school, 247; pharmacy, 247; social service, 361; preparatory school, 502. The registration for the summer session of 1932 was 1250. There were 400 faculty

members. The endowment fund amounted to \$493,000. There were 115,000 volumes in the library. President, the Rev. Aloysius J. Hogan, S.J., Ph.D.

**FOREIGN EXCHANGE.** See FINANCIAL REVIEW.

**FOREIGN STUDENTS.** See IMMIGRATION; UNIVERSITIES AND COLLEGES.

**FOREST FIRES, FOREST PROTECTION.** See FORESTRY.

**FORESTRY.** Harassed by the deluge of economic troubles that beset other industries, forestry again suffered severely in 1932. According to a statement issued by the special lumber survey committee of the Timber Conservation Board appointed by President Hoover in 1931, lumber consumption decreased from a total of some 35 billion board feet in 1929 to approximately 12 billion feet in 1932. Aggravating the general situation was the existence of large reserves of lumber accumulated at the beginning of the economic upheaval. The situation was further complicated by the avowed attempt of the Russian government to dump large quantities of pulpwood and other lumber on our eastern markets. American lumber producers contended with considerable strength and justice that they could not be expected to compete with cheap foreign labor. As a result the Revenue Act of 1932 contained a provision for an import tax of \$3 per thousand board feet for all lumber except maple, birch, and beech, and considerable sentiment developed for the complete exclusion of Russian lumber on the ground that it is produced largely by conscript labor.

Withal there were rays of hope in the dark situation. More thought was paid in 1932 to the matter of planting of cut over and other marginal lands that are now producing little or nothing worthwhile and yielding no tax returns. That forestry offers the only sensible plan for treatment of such unprofitable areas was accepted generally, and the sympathetic attitude of President elect Roosevelt toward forestry, as expressed in his acceptance speech in Chicago, was considered highly hopeful by many foresters and conservationists alike. In a letter to the president of The Society of American Foresters, published in the December number of the *Journal of Forestry*, the President elect stated "I believe a great deal can be accomplished by an intelligent reforestation programme, both as an aid to unemployment and as a permanent benefit for our citizens of the present and future." In view of the important part that European forests play in the public welfare, it appears altogether probable that considerable benefit could be derived in America from more intensive utilization and development.

**RUSSIAN LUMBER.** European and American forest industries continued to be alarmed by the large quantities of Russian lumber and lumber products available for export at extremely low prices. Under the stimulus of the 5-year plan, Northern Russia in 1930 doubled its pre-war output of timber and, in view of low wages paid workers, was able to offer lumber at prices impossible to nations with higher wage scales. A popular article in an American journal estimated that there are approximately 2,500,000 square miles of forest land in Russia in which there are some 850,000,000 acres available for cutting, an area equal to the combined cutting possibilities of the United States and Canada. The potential

menace of such a huge timber reserve, when thrown recklessly on the markets of the world, is self evident. Already Russian lumber reaches the ports of North and South America, England, France, Spain, Italy, and other European countries.

**THE NATIONAL FORESTS.** As stated in the annual report of the Forester of the U. S. Department of Agriculture, the net area of the national forests on June 30, 1932 was 161,360,691 acres, an increase of 573,004 acres during the year. Forest purchases in Vermont were consolidated and designated the Green Mountain National Forest. The Shenandoah National Forest in Virginia was renamed the George Washington in commemoration of the bi-centennial anniversary, and the Jefferson National Forest in Montana was rechristened the Lewis and Clark in honor of the intrepid explorers of the Northwest who bore those names. Sales from forests were greatly reduced in 1932 both as a result of decreased demand for products and the policy of the Forest Service in discouraging new lumbering enterprises in the public domain. In a number of instances, unemployment relief organizations were permitted to cut fuel wood in the national forests for distribution to the needy and other measures, such as the building of roads and trails, were pushed with the aid of emergency funds with a view to helping alleviate the unfavorable situation. Forest land reached its lowest value in many years but, unfortunately, the money available for land purchase was also sharply restricted. However, it is noteworthy that sentiment in favor of enlarging the national forest areas continued strong, especially in the eastern States where the National Forest idea is relatively new.

**LUMBER TRADE.** As evidenced in data supplied by the U. S. Department of Commerce in its monthly summaries of foreign commerce covering the ten months ended Oct. 31, 1932, there was a sharp decline in the value of both exported and imported lumber and lumber products in 1932 as compared with the preceding year. The total value of exported unmanufactured wood, sawmill products, wood manufactures, paper base stocks, and paper and its manufactures was only \$51,406,648 in 1932 as compared with \$88,303,757 in 1931. The value of imports of the same items totaled \$139,581,675 in 1932 as compared with \$196,217,388 in 1931. The bulk of the imports was made up of paper base stocks, \$43,930,961, and paper and its manufactures, \$80,331,406, largely brought in from Canada. In view of the fact that the United States contains ample land upon which to grow its lumber needs, the great excess of imports above exports would appear to be a distinct challenge to foresters.

**FOREST PROTECTION.** According to the U. S. Forest Service, the extremely dry summer of 1931 resulted in an extremely hazardous fire situation in the Northwestern States. Even the swamps dried out and burned with huge volumes of smoke that greatly hindered the lookouts in their fire detection activities. In 1931, twenty Forest Service employees were killed while engaged in the suppression of fires. The governors of Montana and Idaho actively participated in the emergency by issuing drastic orders concerning entrance into the forested areas. The Idaho executive declared martial law in a number of counties, calling out portions of the National Guard to enforce his mandates. Rains and

snows in early 1932 were highly beneficial and greatly modified the situation. Up to September 1, the expenditures of the U. S. Forest Service in fire control were only 15 per cent of those of the corresponding period in 1931. New and hopeful features were the distribution in the Northwest in 1932 of 160 new radio sets equipped with transmitters and receivers, and the greater use of aéroplanes to transport men and supplies into comparatively inaccessible regions.

Of less spectacular nature than fire but none the less dangerous was the continued onset of insects and disease. White pine blister rust spread in the commercial white pine forests of northern Idaho and western Montana. Despite the knowledge that the eradication of wild currants and gooseberries would control this disease, foresters were prevented from winning the battle by the very magnitude of the task. Bark beetles also menaced the western pine forests but yielded to the Spartan treatment of cutting the infested trees and removing the bark.

**FORESTRY RESEARCH.** Economic aspects of forestry, as might be expected from the generally unfavorable business situation, received increasing consideration in 1932. The reversion in certain areas, such as the Lake States, of vast acreages of cut over land to the States as a result of delinquent taxes presented a serious land use problem for which no established methods of treatment were available. Studies carried on by the Forest Service in the pine region of the Southeast indicated that a large part of the southern pine area will yield fair returns if kept reasonably well stocked with trees, the present stands being in many cases altogether inadequate.

Erosion surveys carried on in various areas of the United States disclosed the fact that the major rivers, such as the Mississippi, Colorado, and Rio Grande, take tremendous tolls from the agricultural lands. In many cases, it was evident that erosion had increased greatly in recent years, due to overgrazing, destructive lumbering, and fires. Arthur M. Hyde, Secretary of Agriculture, recognized the seriousness of the erosion problem and openly discussed the subject in current periodicals.

In the face of approximately 250 million dollars of imports of pulp and paper in 1931, the Forest Products Laboratory at Madison, Wisconsin, continued its study of the paper-making possibilities of various species. Strong white papers of excellent quality were made from loblolly, longleaf, and slash pines of the South, and considerable work was done with Douglas fir and other western species. The Yale University School of Forestry gained and Massachusetts State College lost by the transfer of the Northeastern regional forestry station from Amherst to New Haven in the early fall of 1932.

**MISCELLANEOUS.** Through the generous support of Edward S. Harkness and John D. Rockefeller, Jr., the Save-the-Redwoods League was enabled to acquire 4892 acres of superb redwood forest in Northern Humboldt County, California. This notable transaction preserved for posterity a noble stand of forest giants whose beauty is enhanced by a goodly mixture of hemlock, spruce, and fir and a luxuriant ground cover of rhododendrons, ferns, and other plants.

The sixtieth anniversary of the establishment of Arbor Day was appropriately celebrated on April 22 at the old home of its originator, Julius

Sterling Morton, at Nebraska City, Neb. A special commemorative stamp, printed in red and illustrating the planting of a tree by two children, was issued by the Federal government.

The British government developed a plan of purchasing desirable forest lands and placing thereon, in small homes, worthy unemployed as caretakers.

Hugh P. Baker, dean of the New York State College of Forestry at Syracuse University, was elected to the presidency of the Massachusetts State College at Amherst, and will take over the office about Feb. 1, 1933.

**NECROLOGY.** Joseph W. Toumey, professor of silviculture and former dean of the Yale School of Forestry, and long a national figure in the forestry world, died at New Haven, Conn., on May 6.

W. W. Ashe, Chief of Land Acquisition for the Eastern States, died in Washington, D. C., on Mar. 18, 1932.

**BIBLIOGRAPHY.** A very considerable portion of the current forest literature appeared in the form of bulletins and journal articles. Among these was a notable contribution from the pen of the late J. W. Toumey entitled, "The Yale Demonstration and Research Forest Near Keene, New Hampshire," and published as *Bulletin 33 of the Yale University School of Forestry*. Among books may be listed R. S. Troup, *Exotic Forest Trees in the British Empire*, (Oxford); W. E. Hiley, *Improvement of Woodlands*, (London); M. C. Tresidder, *The Trees of the Yosemite* (Palo Alto, Calif.).

**FORMOSA or TAIWAN.** An island about 75 miles off the southern coast of China, ceded by China to Japan on June 2, 1895. The area is 13,890 square miles, including the adjacent Hokoto (Pescadores) Islands, with an area of about 49 square miles, and other small islands. The population at the census of 1930 was 4,594,161 (3,993,408 in 1925), including about 210,000 Japanese, 130,000 aborigines, and 40,000 foreigners. Taihoku, the capital, had 229,005 inhabitants; Tainan, 95,013; Keelung, 74,541; and Kagi, 54,505. In 1929-30, there were 133 primary schools for Japanese, with 30,148 pupils, and 583 schools for natives with 233,356 pupils. The University of Formosa was opened in 1928. Japanese is the official language, but Chinese (Amoy dialect) is used to a large extent.

Rice, tea, sugar, and various fruits are the chief agricultural products, but the island produces in commercial quantities nearly every tropical and subtropical product. It supplies all of the world's Oolong tea and nearly all of the natural camphor. Indigo, hemp, sweet potatoes, cereals, and peanuts are other crops. The 1931 production of the chief crops was: Rice, 38,303,000 bushels; tea, 21,656,800 pounds; raw sugar, 797,279 metric tons. The total value of mineral production during 1929 was 15,090,503 yen (yen averaged \$0.4885 in 1931). Gold, copper, silver, sulphur, petroleum, and coal are the principal minerals worked. Manufacturing is confined mainly to the making or refining of flour, sugar, tobacco products, oil, iron-work, glass, bricks, and soap. The manufacture and sale of opium, alcohol, salt, sake, camphor, and tobacco products are government monopolies.

Total exports in 1931 amounted to 220,872,866 yen and total imports to 145,622,123 yen. Exports to Japan amounted to 201,424,107 yen and imports from Japan amounted to 114,763,307 yen.

The budget estimates for the fiscal year ended Mar. 31, 1932, were estimated to balance at 115,370,120 yen, including both ordinary and extraordinary accounts. The public debt outstanding on Mar. 31, 1931, was about 116,680,216 yen. In 1930-31 there were 549 miles of government railway lines, a number of private (plantation) railway lines, about 2500 miles of highways suitable for motor traffic, and 759 miles of telegraph, and 2060 miles of telephone wire.

The civil government of the island is administered by a Japanese governor-general, supported by a force of Japanese police. To guard the settled areas against inroads of the still unsubdued aborigines in the northern mountains, a frontier zone of over 300 miles has been established, of which about 230 miles are protected by charged barbed wire. Governor-General in 1932, M. Ohta. See JAPAN.

**FOSTER, WILLIAM Z.** See SOCIALISM; UNITED STATES under *National Election*; COMMUNISM.

**FOUNDATIONS.** There were practically no great foundation works under way during 1932 and even in New York City, which has been the centre for years past of new, novel, and large scale foundation operations, not a single unusual construction has been undertaken. We have noted in past YEAR BOOKS the trend toward open caisson, as opposed to pneumatic caisson, constructions. Perhaps the most interesting developments during the year have been in the details of open caisson constructions.

The plan developed in sinking the Bank of the Manhattan Co. foundations in 1929 involved driving steel tubes through the water bearing sands into hardpan overlying bed rock. With the bottom of the tubes thus sealed, it was possible to excavate the interior material down to rock, without using compressed air.

In the recent construction of the outer-drive viaduct, between the Michigan Canal and the Chicago River at Chicago, Ill., tubes 4 to 6 ft. in diameter, were sunk by jetting through 26 ft. of water bearing sand to the underlying Chicago blue clay. Steel shells 30 ft. long were equipped with six or eight water pipes, spaced equally around the circumference, and only 10 minutes were required to jet a tube down to the clay. Excavation through the clay to rock, 100 ft. below ground surface, was completed by the Chicago open well method, using vertical lagging.

A somewhat similar plan, on a much larger scale, was used in building the piers for the Lillebaelt Bridge in eastern Denmark. The five piers are founded in clay, 21 ft. below river bottom in water 98 ft. deep. Oval caissons, 68 by 156 ft. in size, were constructed in reinforced concrete of cellular design with 94 circular dredging wells in the outer walls. Each caisson was sunk in position by open dredging through these wells. When finally in position, sealed into the clay bottom, the caissons formed cofferdams which were unwatered, the excavation completed and the piers built in the dry.

Many attempts have been made to use boring machines in building foundations. An earth auger of unusual size was used most successfully in the recent excavation of 106 cylindrical wells for the new post office at Detroit, Mich. These wells were from 4¾ to 7¼ ft. in diameter and were bored through stiff clay to rock at an

average depth of 118 ft. The holes were lined with vertical wooden lagging, made up like stave pipe in 16 ft. lengths and driven into place after the well had been bored. The lower end of each well was then under cut by hand, to give a bell-shaped base and increased bearing area, after which the entire well was filled with concrete to form a circular concrete pier.

The rapid development of steel cylinder piles, particularly in New York City, has been noted in recent YEAR BOOKS. Exceptionally long piles of this type, varying from 60 to 140 ft., were used for the foundations of the Starrett-Lehigh Building in New York. After driving the steel shells, generally 10 to 18 inches in diameter and  $\frac{3}{8}$  to  $\frac{1}{2}$  inch thick, the interior earth is blown out by compressed air and the shell filled with concrete. A special long tubular bottom-dump bucket was designed for concreting these shells, which frequently filled with water from the surrounding, water bearing, soil.

Obviously long piles of this type would have little bearing value were it not for the support offered against flexure by the surrounding material. To date no rational method of design has been developed but tests of the Starrett-Lehigh foundations showed settlements of only  $\frac{1}{8}$  inch under a load  $1\frac{1}{2}$  times the design value.

**FOUNDATIONS, EDUCATIONAL.** See EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES, BROOKINGS INSTITUTE; CARNEGIE FOUNDATION; ROCKEFELLER FOUNDATION; RUSSELL SAGE FOUNDATION.

**FOUR H ("4-H") CLUBS.** See AGRICULTURAL EXTENSION WORK

**FOUR-POWER CONFERENCE.** See GREAT BRITAIN under *History*.

**FOWL, FOWL DISEASES.** See LIVESTOCK, VETERINARY MEDICINE.

**FRANCE.** A republic of western Europe, whose land frontiers are bounded by Belgium, Luxemburg, Germany, Switzerland, and Italy on the north and east and by Spain on the south. Capital, Paris.

**AREA AND POPULATION.** The acquisition of Alsace-Lorraine as a result of the World War increased the area of France from 207,054 to 212,659 square miles (see ALSACE-LORRAINE). The population (census of March, 1931) was 41,834,923, as compared with 40,743,897 at the census of 1926 and 39,209,518 at the census of 1921. Slightly more than half of the population was rural in 1931. In the same year there were 2,890,923 foreigners in the country (2,295,642 in 1921). In 1931, births numbered 730,249; deaths, 680,710; marriages, 326,358; divorces, 21,212. The excess of births over deaths was 49,539, compared with an excess of 99,786 births in 1930 and an excess of 12,564 deaths in 1929. Laborers entering the country in 1931 numbered 93,607 and those departing 92,963; in 1930 the respective figures were 187,407 and 54,975.

Populations of the chief cities in 1931, with 1926 census figures in parentheses, were: Paris, 2,891,020 (2,871,429); Marseilles, 800,881 (652,196); Lyons, 579,763 (570,840); Bordeaux, 262,990 (256,026); Nice, 219,549 (184,441); Lille, 201,568 (201,921); Toulouse, 194,564 (180,771); St. Etienne, 191,088 (193,737); Nantes, 187,343 (184,509); Strasbourg, 181,465 (174,492); Le Havre, 165,076 (158,022); Toulon, 133,203 (115,120); Rouen, 122,957 (122,808); Nancy, 120,578 (114,491); Roubaix, 117,190 (117,209); Reims,

112,820 (100,998); Clermont-Ferrand, 103,143 (111,701).

**EDUCATION.** Elementary education is free and compulsory between the ages of 6 and 13. The school system is centralized under the Superior Council of 52 members, which acts in collaboration with the Minister of Education and a consultative committee. In 1929-30, there were 3691 infant schools, both public and private, with 369,190 pupils; 80,224 primary schools, with 4,358,887 pupils; and 531 higher elementary schools, with 76,040 pupils. For secondary education, there were in November, 1930, 125 *lycées*, with 83,764 students, and 235 communal colleges, with 44,537 students, for boys and (including Algeria) 205 *lycées*, colleges, and secondary courses for girls, with 59,339 students. The 17 free universities in France had a total of 73,601 students on July 31, 1930. Various other institutions provided technical and professional training.

**AGRICULTURE.** About 41 per cent of the working population are engaged in agriculture, there being about 5,500,000 farm owners, with an average holding of 24 acres. In 1928, 89,222,061 acres were under crops, fallow, or grass, compared with 25,170,407 acres of forest land and 11,281,033 acres of moor and uncultivated land. Despite her large farm production, France normally imports cereals and colonial produce; there is generally an export surplus of wine, dairy products, fruits, and vegetables. Due to short wheat crops in 1930 and 1931 the French farmers sold their entire produce within the country at a good profit. In 1932, however, there was a bumper wheat crop estimated at 330,000,000 bushels and the price dropped sharply, causing much distress (see *History*). Production of the chief crops in 1930 and 1931 are shown in the accompanying table from the 1932 *Commerce Yearbook*.

FRENCH CROPS—AREA AND PRODUCTION

Crop	Area <sup>a</sup>		Production <sup>b</sup>	
	1930	1931	1930	1931
Wheat . . .	13,280	12,497	228,104	269,630
Rye . . .	1,846	1,775	28,394	31,013
Barley . . .	1,842	1,960	42,457	54,807
Oats . . .	8,460	8,638	285,955	344,222
Corn . . .	833	833	22,379	23,654
Potatoes . .	3,532	3,516	511,572	592,189
Sugar beets .	679	599	8,814	6,089
Beet sugar <sup>c</sup>			1,181	856
Grapevines .	3,465	3,559	1,109,810	1,517,870
Olive <sup>d</sup> . . .			90,389	104,057
Olive oil <sup>e</sup> . . .			2,028	1,130
Hay . . . . .	7,131	7,176	12,793	12,867
Fodder beets .	2,039	2,036	31,206	30,329
Green forage .	1,759	1,794	12,588	13,394

<sup>a</sup> Thousands of acres. <sup>b</sup> Thousands of units—bushels except as indicated. <sup>c</sup> Unit, metric ton. <sup>d</sup> Seasons ended following year. <sup>e</sup> Unit, gallon of wine. <sup>f</sup> Unit, pound. <sup>g</sup> Unit, gallon of oil.

Livestock at the beginning of 1931 included 15,467,000 cattle, 10,152,000 sheep and lambs, 6,329,000 swine, 2,924,000 horses, and 154,000 mules. Silk culture is carried on in 24 departments, the value of the 1930 output totaling 14,612,000 francs. Provisional crop returns for 1932, in metric quintals (of 220.4 pounds), were: Wheat, 90,182,000; mixed wheat and rye, 955,000; rye, 8,938,000; barley, 11,687,000; oats, 51,294,000.

**MINING.** French deposits of iron ore in Lorraine are the richest in Europe and, next to those of the United States, probably the richest in the world. French coal supplies, however, have to be supplemented by imports from Germany. Metallurgical production was more than

doubled from 1919 to 1930. The index figure for the average monthly metallurgical production, calculated on a base of 100 for 1913, stood at 129 for 1929, 125 for 1930, 103 for 1931, and 71 in August, 1932. The output in metric tons of the principal mineral and metallurgical products in 1931, with 1930 figures in parentheses, was as follows: Coal, 49,920,000 (53,885,000); lignite, 1,044,000 (1,143,000); pig iron, 8,220,000 (10,035,000); steel, 7,812,000 (9,447,000); bauxite, 348,000 (538,000); iron ore, 38,476,000 (48,816,000); iron pyrites, 193,000 (198,000); potash, 355,000 (507,000).

**MANUFACTURING.** The decline in manufacturing production, which commenced in 1931 as a result of the world depression, continued until the middle of 1932, when some improvement was noted. The general index of industrial production, calculated on a base of 100 for 1913, showed an average monthly output of 139 in 1929, 140 in 1930, 124 in 1931, 92 in July, of 1932, and 93 in August. According to an announcement of the Minister of Labor on Oct. 23, 1932, the number of registered unemployed had declined from 375,000 in March to 256,000; returns from the turnover tax, which closely indicated the business situation, had increased and transportation figures showed a slight improvement. The number of registered unemployed on Oct. 1, 1931, totaled only 39,360. The total number of unemployed in October, 1932, was estimated at about 1,000,000. In addition, several million workers were employed part time. France added to her power resources in 1932 by opening at Kembs on the Rhine on October 9 a 200,000-horse power hydro-electric station, which is to have an ultimate annual energy production of 700,000,000 kilowatts.

Statistics of manufacturing production in 1930 and 1931 are shown in the accompanying table from the 1932 U. S. Commerce Yearbook.

#### MANUFACTURING PRODUCTION OF FRANCE

Product	1930	1931
Silk (conditioned at Lyon) . . . 1,000 lbs	10,661	7,857
Wool (conditioned at Roubaix-Tourcoing) . . . do	204,049	176,827
Wool (conditioned at Mazamet) . . do	52,328	53,413
Cotton consumption " . . . do	794,611	490,372
Cotton cloth . . . . . million yds.		
Artificial silk . . . . . 1,000 lbs	39,200	38,320
Boots and shoes (estimated) 1,000 pairs	75,000	65,000
Alcohol . . . . . 1,000 gals	79,168	95,702
Vessels launched . . . . . gross tons	100,917	103,419

\* Including waste

**COMMERCE.** Foreign trade declined during 1931 and 1932. Imports in 1931 totaled 58,095,899 metric tons valued at 42,199,302,000 francs, as against 60,920,191 tons valued at 52,510,812,000 francs in 1930. Exports amounted to 30,329,434 tons, valued at 30,421,327,000 francs, compared with 36,080,192 tons valued at 42,835,221,000 francs in the previous year. The excess of imports over exports increased from 9,675,591,000 francs in 1930 to 11,777,975,000 francs in 1931. In 1932, the total foreign trade amounted to 49,500,000,000 francs (about \$1,930,500,000), compared with 72,600,000,000 francs in 1931. Imports, totaling 29,826,000,000 francs, were 29.3 per cent lower than in 1931, while exports, at 19,693,000,000 francs, were 35.3 per cent less. The excess of imports over exports for the year was 10,132,000,000 francs (about \$395,148,000). The 1932 figures are preliminary.

Comparative values of the leading import and export items in 1930 and 1931 are shown in the accompanying table.

#### CHIEF FRENCH IMPORTS AND EXPORTS, 1930 AND 1931 [In millions of francs]

IMPORTS		1930	1931
Coal and coke . . . . .		3,628.3	4,438.7
Cereals . . . . .		2,081.3	2,999.7
Wine . . . . .		2,155.5	2,938.9
Machinery . . . . .		2,615.4	1,903.7
Wool . . . . .		3,180.3	1,800.7
Raw cotton . . . . .		8,280.4	1,502.0
Oil seeds . . . . .		2,091.0	1,458.1
Petroleum . . . . .		2,246.0	1,864.9
Coffee . . . . .		1,121.0	973.4
Chemicals . . . . .		1,133.6	931.6
Copper . . . . .		1,456.0	797.5
Hides and skins . . . . .		1,046.9	701.4
EXPORTS		1930	1931
Chemicals . . . . .		3,209.9	2,515.9
Iron and steel . . . . .		2,181.7	1,785.3
Textiles, silk . . . . .		2,501.7	1,721.1
Textiles, cotton . . . . .		2,145.3	1,411.5
Clothing . . . . .		1,662.3	690.8
Automobiles . . . . .		1,122.7	837.5
Wine . . . . .		886.7	665.1

The United Kingdom was France's leading customer in 1931, followed by Belgium, Germany, Switzerland, and the United States, in the order named. Germany was the leading source of supply, with the United States, United Kingdom, Belgium, Italy, and Switzerland following in order. The value of French trade with the leading countries in 1930 and 1931 is shown in the accompanying table.

#### FRENCH FOREIGN TRADE, 1930 AND 1931 [In millions of francs worth \$0.0392 at par]

Countries	Imports		Exports	
	1930	1931	1930	1931
United Kingdom . . . . .	5,272.9	3,724.5	6,845.3	5,038.1
Germany . . . . .	7,937.1	6,132.8	4,155.0	2,748.4
United States . . . . .	6,148.1	3,803.4	2,434.9	1,543.9
Belgium . . . . .	4,198.8	3,635.8	5,442.0	3,581.5
Switzerland . . . . .	1,132.8	903.8	3,094.9	2,308.3
Italy . . . . .	1,526.8	1,440.3	1,681.1	992.1
Spain . . . . .	1,508.5	1,402.5	1,128.7	865.6
Argentina . . . . .	1,203.1	1,428.3	877.7	515.7

One of the major invisible items offsetting the 1931 excess of imports was the expenditure in France of an estimated total of \$400,000,000 by some 1,540,000 foreign tourists, including about \$120,000,000 spent by approximately 200,000 Americans. In 1928, tourists spent about \$600,000,000 in France, of which about \$200,000,000 represented the expenditures of Americans. Tourist visitors during 1932 were placed at 944,358, of whom 522,000 were British and 143,208 Americans.

**FINANCE.** As from 1930, the financial year commenced on April 1, but on Oct. 17, 1931, the government decided to revert to the calendar year. For the nine months from Apr. 1, 1932, to Dec. 31, 1932, revenue was estimated at 41,087,273,326 francs and expenditure at 41,083,386,532 francs. This compared with estimated revenue and expenditure of 50,643,485,395 francs and 50,640,509,352 francs, respectively, for the entire fiscal year ended Apr. 1, 1932. Actual revenue for the 1931-32 fiscal year totaled 52,757,500,000 francs and actual expenditure about 56,348,500,000 francs, leaving a deficit of about 3,591,000,000

(about \$334,000,000). The deficit for the nine months ended Dec. 31, 1932, was provisionally estimated at 5,000,000,000 francs (about \$200,000,000).

The internal debt on Mar. 31, 1931, stood at 283,040,564,211 francs (279,873,514,866 francs on Mar. 31, 1930), of which 228,057,028,211 francs represented the long-term funded debt, 15,894,187,000 francs the short-term (2 to 10 years) funded debt, and 39,089,349,000 francs the floating debt. The foreign debt Mar. 31, 1931, included \$3,865,000,000 owed to the U. S. government, £759,000,000 owed to the British government, and commercial debts aggregating \$4,806,656,400 and 5,736,230 Argentine pesos.

**COMMUNICATIONS.** The French railways, extending about 26,177 miles in 1931, were divided into seven systems, the largest (5665 miles) being operated by the state. The other six systems were owned by the state and leased to private companies. In September, 1931, 1043 miles of line were electrified. The state railways reported a provisional operating deficit of 2,944,000,000 francs in 1931, as compared with a deficit of 1,884,000,000 francs in 1930. The highway mileage in 1931 extended about 405,028 miles, of which 22,369 miles were macadam and 380,173 miles were improved earth, sand, clay, or gravel roads. Navigable waterways aggregated about 6204 miles. A 75-mile stretch of canal along the upper Rhine, which when completed would permit uninterrupted navigation from Rotterdam to Basel (Basle), Switzerland, was under construction in 1932. The Moselle Canal from Metz to Thionville was opened Aug. 14, 1932. A census of 1931 showed 12,104 canal boats in France, with a capacity of 4,058,184 tons. In 1931, five subsidized and one unsubsidized air-transportation companies operated regular services over about 20,000 miles of lines both within and outside of France. They carried 32,700 passengers (28,935 in 1930) and 411,000 pounds of mail (440,000 in 1930).
